Mr. Street and Mr. Barry having the two great national works allotted to them, a difficulty remained as to Mr. Waterhouse. There were two reasons why something should be done for that gentleman. The barristers and solicitors had pronounced in his favour, and he had considerable political influence at his back in the House of Commons. So strong, in fact, was that influence that many took it for granted from the first that Mr. Waterhouse would have been selected. He, however, was not the only one who used what legitimate influence he could to obtain the prize. Some of the friends of some of the other competitors whispered in the ears of Members of Parliament and called on newspaper editors to point out the merits of particular plans. Mr. Waterhouse, therefore, being passed over in the Law Courts, must have something; and we suppose that the same adroit genius who suggested that the Gordian knot should be cut by allotting to Mr. Street the Law Courts, and to Mr. Barry the National Gallery, added that it would be well to apportion to Mr. Waterhouse the new building at South Kensington. If Mr. Waterhouse is satisfied we will not complain. There are still two other names—those of Mr. Scott and Mr. Burges—which some months since were on almost everyone's lips in connection with the Law Courts. Mr. Scott, with his great reputation and great influence, was looked upon as most likely to be selected. In fact, for some time the pendulum, as far as the public were concerned, gravitated between Mr. Scott and Mr. Waterhouse. Neither being selected, and the latter having had tossed to him, like a tub to a whale, the South Kensington buildings, something at all events must be apportioned to Mr. Scott. In fact, we are not sure, as far as percentage goes, that Mr. Scott will not have the lion's share. He will, it appears, be the architect for the new public offices near Whitehall, which involves the expenditure of millions of public money. "In for a penny in for a pound," as the old proverb says. But what about Mr. Burges? We see no reason, though, why Mr. Scott should have this lion's share allotted to him, and if the final decision be not come to, we hope this matter will receive the reconsideration of the Treasury. Messrs. Scott, Street, Waterhouse, and Barry are no longer rival competitors, but a band of brothers in the public service. Let each one now try not only to rival, but to surpass each other, in the production of good architecture.

CARVED PANELS.

ORNAMENTAL sculpture or carving may be divided into three classes, viz., conventional, natural, and mixed conventional; and natural Egyptian, Greek, Roman, and Gothic give us examples of the first. The natural reigned supreme in the works of Grinling Gibbons and in those of his followers, while the third or mixed style is most apparent in the Renaissance and in some periods of Gothic. In the South Kensington Museum are to be found many examples of good art in all these classes—and some examples which show us more particularly what ought to be avoided. Notably in this latter class is to be mentioned the Paris cabinet of M. Fourdinois, which the "department" has seen fit to import, at some expense to the community, though for what reason the "authorities" of Olympus and South Kensington only know. In this cabinet (which is, by the way, an exceedingly clever bit of work manipulatively) nearly all the principles which guide good art are outraged; the carving, instead of being worked from the solid, is planted as a partial veneer, and, as the planted carving is frequently in a lighter coloured wood than the ground, the effect is in many instances harsh and disagreeable, and one of the great charms of low relief (the delicate softening of the raised parts into the ground) is entirely wanting. This defect is seen most strongly in the work of the lower stage, where the figures in light wood are pasted against a dark ground, giving a hard stiff look at the junction, having convexity but giving no shadow. It is not inlay, neither is it true carving, but it apes the qualities of both, and forms a hybrid which is neither fish, flesh, nor fowl, nor even good red herring. As a general rule carving should clothe the construction, but should not assume a constructive function. Even in capitals, which are usually the most weight-bearing objects for which ornament is used, this rule applies; and the best will be that which has a definite constructive bell (it may be any shape) indicated through the foliage that ornaments it. Another general rule (which, like the last, may be subject to a few exceptions) is that panel carving should be finished within the limits of the panel lines or mouldings, and should not be suffered to shoot beyond them.

J. M. S.

CHURCH OF ST. QUENTIN.

THIS noble church (erroneously called Cathedral on the plate accompanying our present number) is, comparatively to the other large churches of France, but little known to English architects; it, however, well deserves, and, in fact, amply repays a visit. The choir with its chapels dates back as far as 1257, but has been somewhat altered at a later period. The chapels, the subject of our plate, remain as nearly as possible as first built, and are a fine specimen of French Gothic. The clerestory windows of apse contain some good stained glass. St. Quentin also has a fine Hotel de Ville, of the Flemish type, built in the sixteenth century.

CABINET MAKING IN ITALY.

THE last number of the *Society of Arts Journal* contains some useful information on this question. It appears that the manufacture of furniture is one of those industries which have been carried on in Italy successfully from an early period up to the present time, without having fallen off in importance or declined in any way. During the middle ages, and especially at the Renaissance, the national as well as foreign palaces, royal dwellings, and museums, were filled with *chefs d'œuvre* due to the skill and taste of Italian artisans who were worthy of the name of artists. Although wood carving in Italy does not seem to have aspired, as in northern countries, to infinite richness—and perhaps heaviness—of the ornaments, and to crowded minuteness of detail, it has always preserved that good taste in design, purity in outline, and good proportion, which it has inherited from antiquity. Sienna may be considered as the first cradle of the art, and, up to the fourteenth century, was famous for its wood carving. During the seventeenth and eighteenth centuries this art fell somewhat into decline, but of late years has been revived by many distinguished artists. Amongst the wood carvers whose rich and varied works are an honour to Italian industry, must be mentioned MM. Barbetti, of Sienna, whose vast establishment at Florence, opened about three years ago, employs upwards of 100 workmen, and produces furniture and articles of cabinet-making to the extent of 100,000f. (£25,000) per annum. In Piedmont and the province of Genoa a good deal of turning is carried on, and for this purpose from 30,000 kilogrammes to 40,000 kilogrammes of box-wood are imported yearly. Another important branch of industry is that of chair-making, at Chiavari. These chairs are extremely light and elegant, and were formerly imported from France, under the name of Paris chairs; at the present time they are exported to France instead. The stalls of choirs, confessionals, baptisteries, lecterns, organ cases, book cases, wainscoting, &c., executed at Genoa and Turin will rival anything of their kind that has been produced in other countries. The

manufacture of common and cheap furniture is likewise carried on to a great extent, and the trade in furniture made of native wood, without veneering or gilding, has of late made great progress. At Milan, and throughout the whole of Lombardy, the manufacture of furniture has made considerable progress. At Milan alone there are thirty manufactories, in which 250 men are employed, whose earnings range from 1·76fr. to 3·52fr. per day, and more than 100 children. While conforming to the requirements of luxury and of fashion, the Milanese manufacturers make furniture of excellent design in fine woods, such as the mahogany and walnut, which are often richly carved; also in marqueterie work, inlaid with metal in rich and varied design, and others in fine woods, such as rosewood, Hungarian ash, enriched with bold ormolu ornaments, with incrustations of differently-coloured stones, or with miniatures in majolica. The articles manufactured at Milan are in no way inferior to those made in the fourteenth century, and are remarkable for the elegance of their form, beauty, and good taste of design, and solidity and good workmanship. In various parts of the province of Milan, and especially in the neighbourhood of Monza, Como, Lissone, Cesano, Boisio, Barlassina, Lazzate, Seveso, Mede, this industry gives employment to upwards of 350 families, and the number of workmen is never less than 600 in the summer, and exceeds 1,000 in the winter, with average wages of 1 76f. The furniture made in this country is chiefly of walnut, and, so far as their price is concerned, they are within reach of all classes; that of Mede is distinguished for its cheapness. In the province of Brescia there are seven manufactories of furniture, producing annually about 400,000f (£16,000). In the principal towns in the Venetian provinces the manufacture of furniture is carried on to meet the demand. There are many excellent manufacturers at Venice and Vicenza. In the provinces of Emilia, Umbra, and the Marches, a good deal of furniture of gilt wood and ordinary work is made. The manufacturers of Naples execute work of every kind suitable to the requirements of all classes. The raw materials employed in this manufacture are as follows:—Indigenous wood, such as walnut, maple, oak, cherry, jujuh tree, lime tree, elm, alder, &c.; of foreign woods—the Indian walnut, ebony, rosewood, black oak, mahogany, and sandal wood]; silk and woollen stuffs, cotton cloths, leather, and oil-cloths, from England, France, and America, as well as from national manufactories; trimmings, principally from the manufactories of Milan and other towns in Italy, and some from England, France, and Belgium; varnishes, from France, England, and Switzerland, as well as from national manufactories.

ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—The closing meeting of the tenth session of this association was held on Wednesday week, Mr. John C. Hay, president, in the chair. The secretary read the annual report, from which it appeared that the association was in a highly flourishing condition, twenty-four new members having been added to the roll during the session; and that the business of the session had been more than usually interesting. Reference was made to a new feature—namely, popular meetings, introduced experimentally for the first time; and, from the success which had attended them, they were recommended to be continued occasionally during future sessions. From the treasurer's report, also, it was found that the funds showed a considerable balance in favour of the association. The president then delivered his valedictory address, in which, after giving a brief *resume* of the business of the session, he made a few remarks on the principal public edifices at present being erected in the city, and concluded by complimenting the members on the success of the past session, and the large increase which had taken place in the membership, and thanked them for the courtesy and good feeling which he had experienced during his tenure of office. A hearty vote of thanks was awarded to Mr. Hay for his address, and for the valuable services he had rendered the association during the time he had occupied the chair. It was arranged that the annual excursion be to Borthwick and Crighton, and that it should take place on Saturday, the 13th inst. The following gentlemen were elected office-bearers for the next session:—President, Mr. Alex. Ballantine; vice-president, Mr. John C. Hay; secretary, Mr. H. J. Blanc; treasurer, Mr. W. G. Shiells, both re-elected; librarian, Mr. Thomas Bonnar; and council, Messrs. F. C. Sumichrast-Roussy, Bryce, Dick, and Annan.

ARCHÆOLOGY.

THE monthly meeting of the Royal Archæological Institute was held on Friday, General Lefroy, R.A., in the chair. A paper was read, contributed by Mr. J. Ernest Brudenell Bruce, on recent excavations at Guisborough Priory, in Yorkshire. The very Rev. Canon Rock, in proposing a vote of thanks to Mr. Bruce, complimented that gentleman on the able paper he had communicated to the Institute. General Lefroy then read a paper on the great cannon of Mahommed II., lately received at Woolwich from the Sultan, and which was said to have been cast in 1443, the weight of which was upwards of twenty tons; and Sir T. E. Winnington, Bart., exhibited photographs of sepulchral slabs recently found in the churchyard of Droitwich.

An international congress of history and archæology will assemble at Bonn, between the 13th and 20th September. An exhibition of works of art and antiquities is to take place there at the same time.

A Masonic archæological society has been established to elucidate and popularise the antiquities and history of Freemasonry.

M. Lambert, the under librarian of the seminary at Toulouse, has just discovered at Lalande a Gallo-Roman cemetery. It is situate on the right bank of the Garonne, 150 yards from the river. Twenty tombs have been found, all formed in bricks bearing a monogram. In each was a body, which crumbled to dust on exposure. The vault is to be reopened, when a careful examination and report are to be made.

PARLIAMENTARY NOTES.

ON Friday last, in the House of Commons, Mr. B. Hope said he wished to call the attention of the House, and more particularly of the Chief Commissioner of Works, to an advertisement which had appeared, to the effect that the materials of the colonnade, with the Doric stone columns and frieze, of Burlington House, were to be sold by auction. Such a sale would, of course, bring in a few miserable pounds to some department of the Government, but it would have the effect of removing from the metropolis or of destroying altogether a work which had some historical interest and a considerable amount of architectural beauty. The Government might re-erect that colonnade in one of our public parks or gardens, or if they could not restore the whole colonnade they might at all events put up the archway. He should protest against the Vandalism which would thus destroy the monuments of the art and of the history of our country. He hoped his noble friend would give them some assurance that the building was not to be knocked down to the highest bidder, but that it would be replaced upon some suitable public site. Lord J. Manners said he should be very happy to treat in private with his hon. friend in reference to the sale of that building. He was already in communication with the member for Whitehaven (Mr. C. Bentinck) upon the subject, and if his hon. friend who had addressed to him that question would also honour him with a visit he should be glad to see him, for he could meet his views. Mr. D. Griffith said he thought the noble lord ought to have given a more serious answer to the question put to him by the hon. member for the University of Cambridge. The House had not, he believed, been informed that the colonnade was to be destroyed.

The Thames Embankment (Chelsea) Bill was read a third time and passed.

THAMES EMBANKMENT.

On Friday last the Chancellor of the Exchequer moved the second reading of a bill to enable the Metropolitan Board of Works to raise a loan under a Treasury guarantee for the completion of the Thames Embankment and Mansion-house-street. The amount of the loan he stated at £1,856,000, and he went at length into the finances of the Board to show that the Treasury had ample security for this guarantee. This security consisted in the metropolitan rates, the surplus of the coal and wine duties up to 1882, the whole of the coal and wine duties between 1882 and 1888, which, reckoned as a deferred annuity, he valued at £600,000, and the property abutting on the Mansion-house, which was worth at least £1,300,000, and these, all taken together, the Chancellor insisted, offered ample security for both capital and interest. He mentioned, too, that while the original estimates for these works were £4,935,000, and the revised estimate £5,568,000, the actual revenue applicable to them which would come into the possession of the Board amounted to £5,662,000. The bill was not opposed, but it led to some discussion, in the course of which Mr. Goschen, while approving the measure, criticised sharply the mode in which the Metropolitan Board of Works presents its accounts to Parliament, and Mr. Ayrton indulged himself in one of his usual onslaughts on the Board of Works and in a characteristic laudation of the proceedings of a Select Committee (where he had been a prominent member), which, if its recommendations had been attended to by the House, would have put the Board on a more satisfactory footing. Mr. Harvey Lewis and Mr. Tite also supported the bill, but before it could be read a second time the House was counted out at 20 minutes to 10 o'clock.

Building Intelligence.

CHURCHES AND CHAPELS.

The Dean and Chapter of York have generously offered to undertake the restoration of the church of St. Mary, Castlegate, in that city. Mr. Butterfield has been engaged in a personal investigation of the many architectural features which the edifice presents, previous to a prompt commencement of the work.

A new Congregational Chapel was opened at Tynemouth on Wednesday week. The style is florid Gothic, and the plan consists of nave, aisles, and transepts, with clerestories on either side. Mr. T. Oliver, of Newcastle, is the architect, and Mr. Robinson, of Tynemouth, the contractor.

The foundation stone of a new United Presbyterian Chapel at Hamilton, N.B., was laid on Thursday week. The style of the building is Early English, and it will seat 570 persons, at a cost of £1,250. Mr. Baldie, of Glasgow, is the architect.

The foundation stone of a new Independent Chapel was laid at Maesbury, near Oswestry, last week. The style is Gothic, and it will be built of pressed bricks, relieved with stone dressings. The design is by Mr. W. H. Spaull, of Oswestry.

St. Paul's Wesleyan Chapel, Old Swan, Liverpool, was opened for Divine service last week. The chapel is of an oblong form. It contains 460 sittings, upwards of 100 being free. The building is of red stone, in the Gothic style, the cost of the whole, including land, being about £3,000. The architects are the Messrs. Green and Parslow, of Dale-street; and the contractor, Mr. John Westmoreland, of Islington.

The church of St. Hilda, at Ampleforth, was reopened on Sunday by the Archbishop of York. The old building, a fine specimen of Norman architecture, had become so dilapidated that it was considered quite unsafe. It has been accordingly removed, and the present building erected, all of interest in the ancient church having been scrupulously cared for and preserved.

St. Andrew's Church, at Compiégne, built by the liberality of an English lady, for the use of the English residents at that town, was opened lately. The style of the building, which was designed by Mr. Thornton Shiells, of Edinburgh, is Early English, and accommodation is provided for nearly 200 persons.

The parish church of Tibberton, near Worcester, dedicated to St. Peter and Vincula, has been rebuilt, and was consecrated by the Bishop on Tuesday week. Mr. J. W. Hopkins is the architect. The cost is £1,100.

On Monday week the corner stone of a new Baptist Chapel was laid at Church, near Accrington. The chapel will be in the Italian style, and its dimensions 72ft. by 52ft. outside, height 48ft., and inside height, 36ft. The building will seat 702 persons, the estimated cost is £2,300, and it will be erected from the designs of Mr. Jonas Turner, architect.

On Tuesday week Lord Shaftesbury laid the foundation stone of a new church, at Bournemouth. The object of its erection is to counteract the effect of Catholic teaching and practice at the neighbouring church of St. Peter. There will be 1,031 sittings, only 350 of which will be free. Messrs. Cory and Ferguson are the architects. The church is to be distinguished for its "Protestant simplicity."

The foundation stone of a new Wesleyan Chapel has been laid at Clitheroe, near Preston. The style is Italian, and the estimated cost £2,400, accommodation being provided for 650 persons. The architect is Mr. J. Turner, of Accrington, and Mr. J. Parry, of Clitheroe, is the builder.

A new Roman Catholic Church in London, the Church of Nôtre Dame du France, was opened on Wednesday last. The church is situate at the north-east corner of Leicester-square, the building having been for a long series of years that in which Burford's celebrated panoramas were exhibited. There is a long passage from the end of Cranborne street, and the church itself lies behind the east side of Leicester-place. The old building has undergone many changes, and would hardly be recognised by those who in times past derived instruction and pleasure from Mr. Burford's geographical exhibitions. A splendid altar has been raised, and the other ecclesiastical arrangements have been carefully attended to by the Marist Fathers, to whom the mission has been entrusted.

All Saints' Church, Clifton, was consecrated on Monday by the Bishop of Gloucester and Bristol. A very elaborate set of plans in the Transition Gothic style were originally prepared by Mr. G. E. Street, and there is room for hope that these plans may yet be realised in their entirety. At first it was intended to complete the erection for £8,000, but already £11,000 has been expended, and it is estimated that £8,000 more is wanting. The original design provided for a nave 112ft. long and 56ft. wide; a chancel 45ft. in the clear and 24ft. between the piers. On each side of the nave were to be five arches, resting on octagonal piers with carved capitals, and over each arch a traceried three-light window. Unfortunately, much of this remains to be done. The nave piers have been carried up, but within them a temporary building has been erected, for the purpose of carrying on Divine worship without further delay. No plaster is used on the walls, the stonework and mortar being merely finished off in a smooth and presentable manner. The work, from the plinth upwards, has been executed under the contract of Messrs. J. Davis and Son; and according to the present arrangements about 500 persons can be accommodated. This is considerably less than the building will hold in its finished state, it being computed that 1,200 at least can then find sitting room.

BUILDINGS.

Last week a new range of day schools was opened at Saltaire. The style is Italian. The base of the building is in massive bosted and channelled ashlar, and the cornice and window dressings throughout in bosted ashlar, with the walls in pitch-faced work. Accommodation is provided for 750 children. The architects are Messrs. Lockwood and Mawson, of Bradford and London.

Rapid progress is now being made with the Metropolitan Meat Market. The hoarding has been removed from the southern end, and the new street from thence into St. John-street will be opened in a few days. The workmen are fast proceeding with the construction of the iron roof which will cover the main thoroughfare between the northern and southern wings. In the northern wing several blocks of shops are now nearly completed. One of the corner towers is completed, and the others are making rapid progress.

Many well-known shops, comprising a good part of St. Martin's-le-Grand, are now closed, and condemned to be pulled down to make room for the new money order office.

St. Thomas' new infant schools, Blackburn, have been recently opened. The style is Early English, built with stone dressings and pier-points, and will accommodate about 400 scholars. They have been erected from designs, and under the superintendence of Mr. James Bertwistle, architect, Blackburn.

The Victoria Hotel, Choumert-road, Peckham Rye, is being erected from the sketches of Mr. J. Arthur, a well-known draughtsman. It stands at the junction of Victoria and Choumert-roads, so as to show two sides. The first floor contains a billiard room, 30ft. by 18ft., from which there is a fine view of Dulwich and the Surrey Hills. The roof is of high pitch, which gives importance to the building. The cost will be about £3,500. The materials are white Suffolk brick, with Portland stone dressings. Mr. J. Lovejoy is the builder.

On June 3 the inauguration of the Bradford Yorkshire Institution for the Blind took place. It has been erected at the corner of North Parade and Cambridge-street, for the employment and instruction of blind workpeople. The style of architecture is plain Gothic, from the designs of Messrs. Knowles and Wilcock, architects, of Bradford. The building is four storeys in height, and has a frontage of 60ft. to North Parade, and 136ft. to Cambridge-street. The premises include a series of large workrooms for the blind of both sexes, who are employed in knitting, brush, basket and skep making, &c., &c. On the ground floor there is parlour, kitchen, and scullery, with four spacious bedrooms over, same for the accommodation of resident matron. The upper rooms are approached by open and separate staircases, which are of stone. The ground floor also contains a convenient library, with shops and offices for the sale of articles they manufacture. The following are the several contractors: J. Burnley and Son, masons' and bricklayers' work; Garforth and Walmsley, carpenters' and joiners' work; John Scholefield and Sons, plasterers' work; Michael Kelson, slaters' work; Thomas Cordingley and Sons, plasterers' work; Lishman Lupton, painters' work. Mr. Abner Rhodes was clerk of works. The total cost of the building, which has been raised by subscription, is £6,533, and at the public meeting which was held on the eve of opening in St. George's Hall, it was declared entirely free from debt.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—I. M. S.—A. P.—H. P.—C. B. A.—W. B.—E. P.—W. and D —I. M. S.—I. H. S.—B. and D.—O. W. D. —W. B.—I. R. S.—R. O. H —W. J. M.—W. G.—I. T. S. M. and Sons —J. E. G.—G. C. and Co.—W. E.—I. M. S.—W. H. R.—I. L. and Son.

CALLIPERS.—There is no such work or paper that we know of.

Correspondence.

PICTURE FRAMES.

To the Editor of the BUILDING NEWS.

SIR,—I am glad you have called attention to a subject much neglected. There is no reason for putting up with stock patterns, as all good mouldings used by frame makers are got out by hand with hollows and rounds; and I may mention that the frame you notice was made by my frame maker, Mr. Francis Draper, of Green street, Grosvenor-square, from a design I gave him, at no greater cost than a stock pattern of equal size would have been.—I am, &c.,

THOMAS HENRY WATSON.

9, Nottingham-place, W., June 8.

LOVE ME, LOVE MY DOG.

SIR,—Might I suggest to Mr. Burges that my sketch of the highly comic puppy in the Architectural Exhibition, which he classes with a unicorn by Pugin, and contrasts with the "beautifully composed and drawn" animals by M. Lameire, is no invention of my own, nor is it a drawing to set forth my ideal of the canine species. It is simply an unexaggerated representation of a caricature for which the medieval sculptor of the font at Bingen ought to be held responsible.—I am, &c., JOHN P. SEDDON.

12, Park street, Westminster, June 10.

UTILISATION OF WASTE HEAT.

SIR,—Allow me to thank Mr. Mathews for his courteous explanation, and to state that I shall be glad to co-operate with him, or with any other gentleman, who might have a suitable opportunity of thoroughly carrying out the proposed system of utilising waste heat. I have not taken out a patent, and can claim, therefore, no invidious privilege, but I am naturally anxious that when the first attempt is made every possible precaution should be taken to ensure its full success.—I am, &c.,

Great Marlborough-street. FREDK. EDWARDS, Jun.

Intercommunication.

QUESTIONS.

[831.]—WHITWORTH SCHOLARSHIPS.—Can you please inform me if there are likely to be any special conditions attached to competing for the Whitworth Scholarships; and if any preliminary examinations will have to be passed?—W. L.

[832.]—DECAY OF LEAD PIPES.—A large quantity of lead pipe connecting the cisterns and w.c.'s in a whole street, and on both sides of it, are in a chronic state of decay; and as the periodical use of new pipes necessitates a serious deduction from the rent receipts, I shall be glad to learn if it is possible to remedy the evil, and what is probably the cause of the complaint? The cisterns stand at one end of the garden, and the privies at the other, a space of 20ft. intervening. The water is supplied by the water company, and the lengths of pipe have the usual connections at their extremities; but they run about a foot under the surface of the ground for their whole length, and where embedded very soon become perfectly honeycombed and worthless. The appearance they present is very similar to some of the submarine telegraph cables after they have been attacked by the boring shell whilst *in profundis*, and found at "fault." Would lime have such an effect on lead piping? The pipes are of stout metal.—DAVEY J. BROOKS.

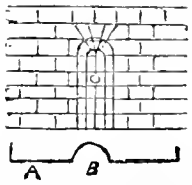
[833.]—CEMENT FOR BROKEN LEATHER MACHINE BELTS AND STRAPS.—I want some good cement for broken leather machine belts. I know of several that adhere well enough, but they do not wear well. Will somebody recommend one that satisfies both these conditions?—GENERAL JOINER.

[834.]—COTTAGE WALLS.—Will 9in. be thick enough for outside and party walls for a cottage about 39ft. long by 25ft. wide, and 15ft. high from ground to eaves, to be built in the country? Would one of your correspondents kindly answer the above?—D. R. Q.

[835.]—STEEL TOOLS.—Can anyone tell me how I can test the quality of fine steel tools?—H. H.

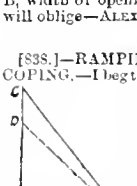
[836.]—PLASTERING WALLS.—How long a time should elapse from the time plaster is put on a wall to the time when it would be safe for interior decoration, without the probability of the decoration being injured?—CLERK OF THE WORKS.

[837.]—WORKING LINES OF A NICHE.—Would any of your readers kindly furnish me with the geometrical



working lines of a niche, as per sketch? A, ground plan: B, width of opening; and C, the height. By so doing they will oblige—ALEXANDRE.

[838.]—RAMPING TWIST AND JOINTS IN STONE COPING.—I beg to thank "S. Lewis" for answering my question (854) so fully, but would still further presume on his kindness. In attempting to work out the diagram on a larger scale, I found a difficulty in applying the rules to given heights and distances. I would, therefore, feel obliged if he would advise me how to act in this dilemma. Also how to find the joints in stone coping. The accompanying sketch will better explain my meaning. Let A B represent the distance from wall; A C, the height of one embankment; A D that of the other. An answer to the above will greatly oblige—AN AMATEUR FOREMAN.

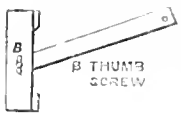


REPLIES.

[873.]—INCLINED BARS.—Allow me to inform "Student" that directly a bar is inclined it loses a great portion of its strength compared to what it possessed when it was in an upright position. The bar is weakened by being inclined in the proportion of the second of the angle of its inclination to the horizon. Taking the first case mentioned by "Student," the bar has to withstand a vertical weight of 10 tons. Wrought iron will bear safely 5 tons to the square inch, so that the area of the bar should equal 2in. to carry the whole load of 10 tons. To find the diameter, therefore, we have to put it in terms of the area. The area

of any round rod equals in terms of the diameter. Putting $\frac{\Pi d^2}{4}$ for the area, $A = \frac{\Pi}{4}$ but $\frac{\Pi}{4} = 0.7854$; therefore the area $= d^2 \times 0.7845$. But the area is equal to two square inches, consequently the diameter $d = \sqrt{\frac{2}{0.7854}}$. Having shown that the bar is weakened by being inclined in proportion to the second of the angle, it only remains, after having found that the value of $\sqrt{\frac{2}{0.7854}}$ for an upright bar is equal to a certain amount, to multiply this by the second of the angle to find the diameter of it in its inclined position.—L. P. N.

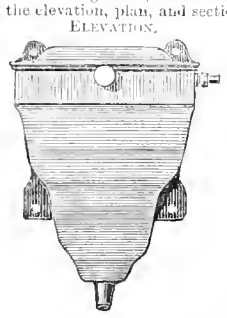
[822.]—PARALLEL RULER.—The answer given to this in my last week I do not think satisfactory. Allow me to suggest that parallel lines can be drawn easily, rapidly, and accurately with a T square, the blade of which is movable, working upon a pin to any angle, and secured by a brass thumbscrew.—W. R. ATKINSON.



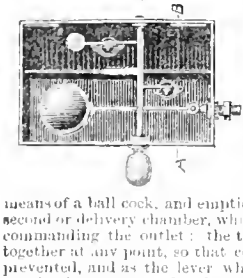
[824.]—WATER-WASTE PREVENTORS.—Every information respecting the Water-waste Preventors can be obtained from Mr. Thomas Beggs, 37, Southampton street, Strand. The price of one of these machines is about £1 10s. Since my last report two additional ones have been erected, making now 69. I believe that we have more of these machines in this district than in the whole of the metropolis combined. They are, indeed, a great boon to the poor, and the water companies now approve of them, and, I believe, are willing to promote their use. It only requires energy on the part of the medical officers of health (which energy must be supported by the local boards) to get them adopted in all the poor localities, and so do away entirely with butts and cisterns. They can be seen in operation in this district; and if any person wishes to see them one of our inspectors will accompany him, provided he call here before 11 o'clock a.m.—JOHN LIDDLE, Office of the Board of Works, Whitechapel District, 15, Great Alie-street, Whitechapel, E.

[824.] In reply to your correspondent, there have been several Water-waste Preventors introduced of late years, and some of them are still in use. One manufacturer told me that he had made some fifteen or sixteen different arrangements for the same purpose. I suggest that it would be very instructive if some of your correspondents would give us a history of all such inventions. The constant supply of water to London, as I take it, depends upon the ability to put a stop to waste. I think the Waste Preventors in the Whitechapel district are very efficient. Two kinds have been used. The first introduced had an air chamber, which filled to the extent that the compressed air would allow it, and it emptied by a cock which closed the inlet when it opened the outlet, and thus prevented a continuous flow of water. One charge could only be taken at a time. The cock was found too delicate for continuous use and hard usage, and therefore it has given place to the present arrangement, which is a service tap. The following is the elevation, plan, and section:—

ELEVATION. SECTION.



PLAN.



In the arrangement not more than a certain adjusted quantity of water can be drawn at one action, although the outlet valve may be held or fixed open; this absolutely prevents the continuous waste of water, and is secured in the following manner:—In such arrangement there are two chambers; the first or supply chamber is filled by means of a ball cock, and emptied through a valve into the second or delivery chamber, which also has a discharge valve commanding the outlet: the two valves cannot be opened together at any point, so that continuous flow or waste is prevented, and as the lever which actuates the valves is weighted so as to make the outlet valve self closing, the flow of water will cease immediately the handle is liberated. The figure, as shown in elevation and section, is intended for staircases, passages, courts, or such like positions, and can be fastened against the wall or other place by means of the brackets shown on elevation. This delivers about two and a half gallons each time. They are made in other configurations, suitable for stand-posts, and the supply of sinks, water-closets, and all purposes of domestic supply. I find they are approved by the East London Water Works and New River Company, and from either company I apprehend, particulars as to price, size, &c., may be obtained.—C.

[826.]—DOLOMITE.—Dolomite in the general sense, is the magnesian limestone. Stone is termed dolomite when composed of carbonate of lime and carbonate of magnesia in nearly equal proportions, and in a high state of crystallisation. The magnesian limestone is remarkable for its varieties throughout its range in the geological scale of this country in one district a white friable limestone, resembling the common chalk; in another district, a hard yellow crystalline stone, capable of some degree of polish. In the latter form, it can only be termed a dolomite. The Bolsover limestone is the best description of dolomite as a building stone. Its weight is 151lb. 10oz per cubic foot, and its chemical analysis is given as follows:—

Silica	3 6
Carbonate of lime	51 1
Carbonate of magnesia	40 2
Iron alumina	1 8
Water and loss	3 3
	100 0

It is a pale yellow colour, the iron occurring in dentritic spots, only visible when newly fractured. This limestone, although hard, compact, and highly crystalline, is not susceptible of the high degree of polish that marbles, porphyries, and granites will receive, and is rarely subjected to that process. Some of our common marbles are called dolomites, a term which they may justly claim, as they are largely composed of carbonate of lime and carbonate of magnesia. The term "dolomite" is rarely used in connection with building materials; it is more a scientific term applied to geology, and is derived from the French geologist Dolomieu. For all practical purposes the magnesian limestone may be considered as the dolomite, and the most important works in this material in London are the New Houses of Parliament and the Museum of Practical Geology in Jermyn street, in the former instance, the stone is rapidly perishing, and in the latter case it has withstood the destructive influences of the atmosphere in a praiseworthy manner. This is generally admitted to be owing to care in selecting the blocks of stone in the quarry; but the secret lies more in the fact that they were obtained from the lower beds in the quarry, viz., from below the level of saturation. In such positions limestones will absorb the calcareous matter removed by disintegration from the upper bed, and so become a hard compact, and highly crystalline material; one capable of receiving a polish and withstanding the influences of the atmosphere when used as a building material.—W. S. Nottingham.

[826.]—This is a name applied to magnesian limestone. In England, large deposits of this limestone occur in the upper beds of the permian system, or that group of rocks which immediately overlies the coal measures. The principal deposits occur in the north east of England, extending from the mouth of the Tyne, in a south-westerly direction through Durham and Yorkshire, into the counties of Derby and Nottingham. These dolomites are employed in the chemical works on the Tyne for the manufacture of sulphate of magnesia or Epsom salts. As a building stone, the dolomites have been highly valuable; those varieties being regarded as most durable which present a crystalline structure, and in which the carbonate of lime and magnesia exist in nearly equivalent proportions. The quarries in the neighbourhood of Bolsover Moor, in Derbyshire, supplied the magnesian limestone employed in the construction of the New Houses of Parliament.—E. E.

[827.]—NORWEGIAN COOKING STOVES.—In reply to your correspondent who inquires about the Norwegian Cooking Stoves, I beg to say there is daily an exhibition at the Polytechnic of an ingenious Norwegian cooking apparatus, which virtually cooks the food placed therein without the constant application of heat in any form. It is this probably he refers to.—SECRETARY.

[829.]—TELEGRAPH POSTS.—If "R E P." granted the use of his wall or top of his house to the telegraphic company without any written or specified conditions, he cannot well expect to get pay or rent for it, whether the company sells its interest to the government or not. I, like "R. E P.", was asked to consent to the erection of a telegraphic post on the top of my house; I did not consent, however, without stipulating for a nominal rent, so the company may be considered my tenant.—J. B.

WAGES MOVEMENT.

A deputation from the Liverpool bricklayers at present out on strike was received last week by the London Trades Council, when the following resolution was unanimously carried:—"That this council having heard the facts and circumstances of the bricklayers' strike at Liverpool stated by the deputation, are of opinion that it could be settled to the mutual advantage of both masters and men by a fair and properly constituted board of arbitration. We therefore instruct the secretary to write to the bricklayers' committee offering the services of this council to take such steps as may be deemed necessary with a view to bringing the contest to a just and satisfactory settlement."

The prevalent rates of wages for various trades in New York at present are the following: Ironmoulders, 3 dols. 50c. a day; bricklayers, 5 dols.; carpenters, 4 dols. to 4 dols. 50c; blue-stone cutters, 4 dols. 50c.; slate roofers, 4 dols. 50c.; stair builders, 3 dols. 75c.; marble workers, 4 dols. 50c.; operative masons, 5 dols.; painters, 3 dols. 50c.; plasterers, 5 dols.; labourers, 2 dols. 50c. to 2 dols. 75c. The quarrymen of West Rutland, Vt., are on strike to procure 1 dol. 75c. a day. They get 1 dol. 60c. at present.

STAINED GLASS.

A stained glass memorial window has just been erected in the south chancel aisle of St. Giles' church, Northampton. The subjects are "Jesus Raising the Widow's Son to Life," and "His command to the Young Man who Boasted he had kept all the Commandments." Messrs. Powell, of Whitefriars, were the artists.

Two stained glass windows have been inserted in the church of St. Michael, Spurriergate, York. The subjects are "The Meeting of Jesus and Martha, the sister of Lazarus" and "The Adoration of the Magi." They are both by Mr. Hodgson, of York.

A painted window (the work of Mr. Bell, of College green, the gift of an anonymous donor, has been fixed on the north side of the chancel of St. John the Evangelist Church, Redland. In one of the lower lights is a representation of our Lord as "The Good Shepherd," and in the other our Lord is represented as "The Saviour of the World."

A bust of the Right Hon. W. E. Gladstone, by Mr. Woolner, has just been placed in the gallery of the Bodleian library at Oxford.

LEGAL INTELLIGENCE.

BREACH OF BUILDING BYE-LAWS.—At Bristol, on Saturday, Mr. J. Pavey, builder, appeared before the magistrates to answer an information issued by the Board of Health, charging him with having neglected to erect certain parapet walls, thus acting contrary to the 37th section of the Improvement Act, 1847 (which provides that a parapet wall should be built two feet above the slates or roofs of the adjoining houses), thereby rendering himself liable to a penalty of £20. From the evidence of Mr. Pope, surveyor, it appeared that four houses had been built by defendant on some land near Boyce's buildings, Clifton, and the required parapet wall separating the roofs of the houses had not been built, so that, in the case of fire, there was nothing to prevent the flames from spreading from one of the houses to the others. Mr. Pope, jun., had told Pavey of the omission, but defendant referred the responsibility to Mr. Mathias, for whom he had built the houses. The magistrates considered Mr. Pavey responsible, and fined him the full penalty, £20, to be mitigated to 1s. as soon as the provisions of the Act should be complied with.

NON-FULFILMENT OF CONTRACT BY A "FREE LABOUR" MAN.—At Sheffield, on Saturday, Mr. Powell, a master builder, summoned a mason named Owen Crane for non-fulfilment of contract. The defendant was one of the men sent down to Sheffield by Colonel Maude, secretary of the Free Labour Registration Society, to take the places of the masons who had struck work. He had received from Mr. Powell the sum of 16s. as "sub money" for himself and his companions, and on the morning when the work was to have been commenced he fetched away his tools and went to Manchester. The other men took a similar course. The defendant was ordered to find sureties to carry out the contract, or in default to be imprisoned for one month. A case for the Court of Queen's Bench was granted by the bench.

THE RIGHT TO PUT FLOWERS ON A GRAVE.—ASHLY *v.* HARRIS.—This was an appeal against the decision of magistrates holding a petty session at Highgate, and the facts were these. The St. Pancras Burial Board had a cemetery at Finchley, and in 1857 Mr. Rowbottom was buried there in a grave which had been granted to his widow in perpetuity. The respondent was employed by Mrs. Rowbottom to plant flowers upon the surface of the grave; but in July, 1867, the Burial Board resolved to take such planting into their own hands exclusively, and that in future no person not authorised by them should do any planting. After this the respondent went to set some seeds upon the grave; and on that occasion the appellant, an officer of the board, prevented this being done. The consequence was that the appellant was summoned for an assault, and was convicted by the magistrates in the penalty of 1s. and costs. The question raised for the Court was whether the board had authority to make a regulation that the graves should be planted only by the persons who were appointed by them for the purpose. The Lord Chief Justice said he was of opinion that the decision of the justices was correct. By the 33d section of their act the Burial Board had authority, under such restrictions as they should think proper, to sell the exclusive right of burial in perpetuity; and in the grant to Mrs. Rowbottom they had not imposed any condition which would prevent her from planting the grave of her husband. She would, therefore, have a right to do this, and the board had no power afterwards to make regulations which would take away the right. Judgment for respondent.

THE THAMES CONSERVANCY BOARD *v.* THE VICTORIA STATION AND PIMLICO RAILWAY COMPANY.—This was an action on award made under the Land Clauses Act, and assessing the amount payable to the plaintiffs for land taken for the building of the defendants' bridge over the Thames. When the case came on in the Court of Common Pleas for trial a few days ago, a verdict was entered for the plaintiffs, subject to the opinion of the court. Mr. Serjeant Haynes now moved for a rule to enter a verdict for defendants; and stated that the bridge was built in 1858, and no claim was made by the defendants for compensation until 1867. He submitted that upon the true construction of the Conservancy Act and the defendants' private act, the conclusion was that the defendants had all their rights under their own act saved to them, and had no power to claim compensation in accordance with the form of procedure provided by the Land Clauses Act. Rule granted.

A CORPORATION'S SEWERING POWERS.—The corporation of Manchester some time ago paved and sewered a street in Ardwick, in exercise of the powers given them by the Manchester General Improvement Act, 1851, under which the cost thereof is payable by the owners of the land lying alongside or adjoining the street. A Mr. Chapman was the owner of the property forming the end of the street, and was charged with his proportion of the expenses, but resisted the claim on the ground that, as the owner of property at the end of the street, he was under no liability to contribute. The stipendiary magistrate decided in favour of the defendant, but the Court of Common Pleas, to which the case was carried, has just given judgment in favour of the corporation.

ACTION AGAINST A CORPORATION.—PAYNE *v.* THE MAYOR, ALDERMEN, AND BURGESSES OF WEYMOUTH AND MELCOMBE REGIS.—This was an action brought by the plaintiff against the defendants to recover a sum of £3,500, being the balance alleged to be due to him under a contract made with the defendants in 1858 for the construction of the pier at the entrance to the harbour of Weymouth. The defendants were authorised to erect the pier, under an Act of Parliament known as the Weymouth and Melcombe Regis Markets and Pier Act, 1859, and in pursuance of its provisions, the corporation made a contract with the plaintiff for £11,700, payable, two-thirds by bonds or mortgages on the security of the tolls and dues of the pier, and the remaining third portion was to be paid in cash on the certificate of the completion of the whole of the works to the satisfaction of the late engineer, Mr. Joseph Cubitt. The pier was accordingly finished by the year 1859, the time specified, and properly certified by the engineer. The corporation had given the contractor the bonds or mortgages as provided by the contract, but denied their liability to make the cash payments, on the grounds that the contract was *ultra vires*, and that the contractor was bound to look to the pier fund created by the special Act under which the pier was erected and the contract made for the satisfaction of his claim. The points were raised in the case by way of demurrer to the declaration setting out the particular contract, and there were also several legal and equitable pleas pleaded by both parties. The arguments commenced on Monday last, and were resumed on Wednesday. The Court took time to consider judgment.

MEETINGS FOR THE ENSUING WEEK.

TUES.—London Mechanics' Institution.—Technical Education for Working Men, second course, Professor Warington Smyth, F.R.S.

FRI.—London Mechanics' Institution.—Technical Education for Working Men, second course, Dr. E. Lancaster, F.R.S., "The Employment of Waste Material in the Arts and Manufactures."

FRI.—Architectural Association.—Election of members "The Influence of the Crusaders on Western Art," T. Wells, Esq.

Our Office Table.

The Duke of Wellington has kindly granted the use of the Waterloo Gallery at Apsley House to the Working Men's Club and Institute Union, for a reading by the Rev. J. M. Bellew, on the 18th inst. Mr. Bellew has placed his services at the disposal of the council of the union on this occasion to enable them to raise funds in aid of two of the institutions in London which it is the purpose of that society to promote.

The Northern Thames Embankment Bill now before Parliament, and which has passed the House of Commons, applying for powers to alter the streets in communication with the embankment on the north side of the Thames, has been so amended that the proposed alterations will not interfere in any way whatever with the Savoy Chapel or the burial ground attached to it, and instead of the new street terminating at the corner of Wellington street in the Strand, it will terminate at the commencement of Lancaster-place. It has also been arranged that neither Northumberland-street nor Craven-street is to be interfered with by the proposed alterations.

The workmen employed in taking down the old George Hotel, Kirkealdy, have just brought to light a curious stone, which had been placed in a recess in what was called the commercial room. It was found inside of the plaster and lath. The following scroll is near the top of the stone—"Post Nebula Phœbus," with the figures "21" on the margin. Unfortunately three or four inches are broken off at the dexter side, so that the figures there are wanting. Beneath the scroll there is a figure of the sun, and beneath the sun a bust, the face of which is somewhat disfigured. Beneath the bust are three perpendicular belts or ribbons, each having a star about the centre. There is besides a great deal of very elaborate workmanship about the figures.

The idea of a "flexible theatre" is certainly a novel one. A Paris correspondent states that he was some days since shown a plan of a theatre which is to be either small, large, or immense, as may be required, and will contain 1,000, 2,000, or 5,000 persons. By a system of movable walls—of course of wood—the theatre is to be elongated or contracted at will, just for all the world like an opera-glass.

The "Adelphi Club" is at length fairly started. The building overlooks the best part of the Thames embankment. The principal room is adorned with a small ceiling painted in oil, which is being restored by Mr. Manfred Holyoake.

Mr. Grove, as Dr. Odling recently mentioned at the Royal Institution, first showed that water may be decomposed by passing steam through a platinum tube intensely heated by the oxyhydrogen flame. M. Deville has recently shown that under such circumstances the hydrogen passes through the platinum while the oxygen is retained in the tube. M. Deville seems to have been repeating some of the experiments of Mr. Graham, with the view of supporting his own theory of dissociation.

Mr. James Nobles, an engineer, of Fitzwilliam-street, Sheffield, has greatly improved the engineers' slide rule by the introduction on it of gauge points for obtaining the weight of steel and wrought iron in square, round, octagon, and triangular bars, in inches, 8ths, 16ths; also in French lines and millimetres. On the back of the rule is a table of decimal multipliers, for obtaining the weight of steel in figures, in inches, 8ths, 16ths, 32nds, 64ths; also in French lines and millimetres in bars of the above sections. The engineer can with this rule obtain his weights without the trouble of calculating decimals. These, and other points of usefulness, render these rules a valuable acquisition to the engineer and mechanic, who owe Mr. Nobles thanks for helping to simplify the work of calculation.

The Lords of the Committee of Council on Education have awarded to Mr. W. J. Muckley, head master of the Manchester School of Art, the first prize for the best report referring to instruction in art, as suggested by the Industrial Arts Committee of the Paris Exhibition last year.

John Humphrey Spanton, to whom the gold medal was awarded by the Royal Academy in December last, has now had the honour of being elected travelling student in architecture for two years.

The members and associates of the Society of Engineers made a visit of importance to the Midland Railway Station, King's Cross, on Friday last. The works are indeed well worth seeing, in their present stage, which is sufficiently advanced to indicate the character of the design as a whole. A station 690ft. long is already spanned by 14 of the 25 main ribs which are to support its arched roof, and which, springing from side to side, cover the enormous distance of 240ft. No roof so wide has ever before been raised.

At a manufactory at Hanley, Staffordshire, about a fortnight since, it was noticed that the walls of a portion of the building called the "saggar" house were gradually falling out of the perpendicular, but several days elapsed before it was found to be due to a seam of coal, technically known as a "smut," which crops up under that part of the building, having become ignited by one of the flues of the "saggar" house, and the fire had in all probability been smouldering for a considerable time. A mining engineer was consulted, and he advised that a shaft six yards deep should be sunk near the seam, and the fire cut off by driving lateral galleries.

A correspondent of the *Scotsman* calls attention to what he calls an act of Vandalism. He says that the shaft of a cross, which for centuries marked the point whence Robert Bruce and his followers left Arran, has lately been removed, and used in the construction, in the neighbourhood, of a dry stone dyke.

The *Daily News*, one of the ablest and most consistent papers published in this or, we believe, in any other country, was reduced in price from 3d. to 1d. daily on Monday last. We regard this as a vast literary enterprise, and heartily wish it abundant success. For impartiality of judgment, breadth of purpose, and purity of principle, the *Daily News* has been unsurpassed.

A standing reproach hurled against the intelligence and prudence of the late Mr. Cobden used to be based upon his investments in the Illinois Central, which, it was supposed, had proved an utter failure. But time brings all things round. The Illinois Central shares have been steadily rallying of late, and yesterday were quoted a little above par.

Mr. Henry Weekes, R.A., has been elected Professor of Sculpture, in the place of Mr. Westmacott, at the Royal Academy.

It is reported that Mr. Holman Hunt is about to leave England for the East, on a rather lengthy period of absence.

On Tuesday last the River Wear Commissioners opened their new docks of eleven acres.

After an expenditure of upwards of £6,000, the plan of draining the town of Shrewsbury, adopted by the Town Council after a series of discussions upon the matter extending over fifteen years, has turned out to be an utter failure.

A man in Morrisania, New York, recently sued a trades' union because his son was discharged from employment on account of its members refusing to work with him, and gained his case.

The Strand Music Hall having been purchased by a gentleman of fortune, is now being pulled down to make way for a theatre of the first class, Mr. C. J. Phipps, F.S.A., being entrusted with the design for the new building.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

3234 P. M. PARSONS. IMPROVEMENTS IN THE MANUFACTURE OF ARTIFICIAL GRANITE SUITABLE FOR BUILDINGS, ENGINEERING STRUCTURES, PAVEMENTS, AND OTHER SIMILAR PURPOSES. (A communication.) Dated November 15, 1867.

Here the inventor employs disintegrated natural granite mixed with clay, together with pounded glass, lava, or iron slags. The disintegrated granite he obtains by submitting fragments of natural granite to a strong heat (about 700 deg. or 800 deg. Cent.) in an oven or furnace, by which, after a sufficient time, it becomes dissolved into a granitic sand, the constituent parts of which quartz or felspar possess great powers of adhesion. One part of this granite sand is then mixed with about an equal quantity of pounded glass, or the constituents of glass, or lava, or iron slag, or a mixture of all or any of them, to which is added from twenty to thirty parts of refractory clay, or from thirty to fifty parts of ordinary clay; this mixture is thoroughly kneaded together with a sufficient quantity of water to make it of a pasty consistency; it is then moulded to any form required, and submitted to a degree of heat sufficient to vitrify the mass, for about thirty-six hours, which converts it into a hard and durable substance resembling granite.—Patent completed.

3239 R. MORSON. IMPROVEMENTS IN KEYS FOR LOCKS. Dated November 15, 1867.

Here the inventor bores the barrel of the key through from end to end, so as to obtain an opening at the rear end of the barrel within the key bow. In a key thus constructed the barrel cannot become choked, as, should any dirt enter it, it is rammed down by the pin of the lock as the key is used, until at last it passes out of the barrel at the back.—Patent abandoned.

Trade News.

TENDERS.

GRANITE.—The Poplar Guardians have accepted the tender of Mr. Ross for 1,500 tons and 500 tons of Guernsey granite spalls at 9s. 4d and 8s 8d. per ton respectively.

BIRMINGHAM.—For additions and alterations to the schools connected with the Lozells Congregational Chapel. Mr. F. D. Johnson, architect:—

Twigg and Fowke	£1445
Hurley and Bloore	1415
Corbett	1408
Bennett (accepted)	1385

BRISTOL.—For extensions, and transepts, and chancel to Emmanuel Church, Clifton, Bristol. Mr. John Norton, architect:—

Beaven	£2724
Davis and Son	2665
Thorn	2623
Jones	2550
Wilkins	2200
Diment (accepted)	1879

BRISTOL.—For the erection of a warehouse for Mr. James Habgood, in Redcliff street. Mr. S. C. Fripp, architect. Quantities supplied:—

M. Kingstone	£846
J. Harris	792
J. Crocker	776
W. Banner (accepted)	729

HOLLOWAY.—For a pair of houses in Tufnell Park, Holloway. Mr. George Truefitt, architect:—

Brass	£2597
Putman	2425
Henshaw	2394
Sharman	2380
Carter	2340
Williams	2337
Bishop	2265
Dinsdale	2260
Ennor (accepted)	2192

LEAVESDEN.—For sinking a well for the New Schools at Leavesden, Woodside, near Watford, for the St. Pancras' Guardians:—

Spiller	£936	5	0
Patten	868	15	0
Jarvine	667	0	0
Adamson	662	10	0
Tilley	485	0	0
Floyd (accepted)	453	0	0

LONDON.—For rebuilding Messrs. Farmiloe and Sons warehouses in St. John street, West Smithfield. Mr. Lewis H. Isaacs, architect. Quantities supplied by Mr. Riddett:—

Sewell and Son	£14,639
Holland and Hannen	14,383
Macey	14,177
Rivett	14,103
Phillips	13,887
Perry and Co.	13,589
Patman and Fotheringham	13,290
Cooper and Cullum	13,250
Webb and Son	13,247
Browne and Robinson (accepted)	12,915

LONDON.—For the erection of Nos. 213 and 214, Upper-street, Islington:—

	Houses.		Party wall.
Grose	£1762	...	£258
Southcott	1695	...	284
Manley and Rogers	1598	...	296
Henshaw	1575	...	275
Patman and Fotheringham	1475	...	225
Williams	1448	...	239
Forrest	1365	...	224
Cowland	1360	...	209
Carter and Sons	1265	...	220

LONDON.—For a warehouse, Upper Thames-street, for Messrs. Walter Macfarlane and Co. Mr. C. H. Driver, architect. Quantities supplied by Mr. R. O. Harris:—

Piper and Wheeler	£3940
Condor	3799
Browne and Robinson	3398
Brass	3254
Gammon and Sons (accepted)	3177

OULTON.—For the erection of residence for Mr. E. C. Copeland. Mr. C. Lynam, architect, Stoke-on-Trent:—

Jeffries	£3306
Inskip (Dilhorne)	3.00
Jutton	3027
Inskip (Longton)	2900
Wool and Flight (accepted)	2750

NEWARK.—For erecting Wesleyan North-end Chapel, with school and offices, in Lover's lane, Newark. Mr. Charles Baily, architect:

	Bricklayers, Masons, Plasterers, and Slaters.	Carpenters, Joiners, Plumbers, Glaziers, Ironmongers, and Painters.	Total.
Dennett and Co.	—	—	£1332 0
Fretwell	—	—	1211 1
Lane (accepted)	£644 14	£529 4	1173 18
Henderson (accepted)	—	546 6	1060 10
Duke	—	—	
Revised tenders:			
Lane	720 14	—	1271 0
Henderson	—	550 6	

NORWICH.—For restoring and enlarging Doughty's Hospital, Norwich, for the Charity Trustees. Mr. James S. Benest, City Surveyor, architect. Quantities supplied:—

Mitchell and Walker	£1400 13 0
Wright	1310 0 0
Wiseman	1300 15 0
Downing	1599 0 0
Newham	1580 0 0
Gilbert	1570 0 0
Hood	1520 0 0
Aldous	1510 0 0
Murray	1498 18 0
Browne and Bailey	1490 0 0
Spinks	1488 0 0
Wilkin and Curtis	1476 0 0
Nelson	1467 0 0
Rice	1465 0 0
Webb	1303 12 0

PENGE.—For roads and sewers on an estate of the London and Suburban Land Company. Messrs. Hammack and Lambert, architects:

Reddin	£7540
Wainwright	7600
Benthem	7234
Ossington	7140
Crockett	7100
Nicholson	7080
Mayo	7051
Bish	7050
Pound	7032
Lawrence	6460
Pizzey	6450
Clark	6389
Bloomfield	6243
Hobbard (accepted)	5930

REIGATE.—For a mansion for Mr. Harvey, at Reigate. The quantities were taken out for Mr. Holdsworth:—

Holdsworth	£2412
Baggaley	2167
Dedman	1784

RAMSGATE.—For building a pair of villas for Mr. Morton, on Lot 14, "The Elms." Mr. John R. Collett, architect:—

Kelson (accepted)	£1434

SUSSEX.—For enclosing Hailsham cattle market, Sussex. R. K. Blesley, architect, Eastbourne:—

Crisford	£1016 6
Robson	947 4
Thompson	875 0
Stonestreet	806 5

WESTCOTT.—For houses for Mr. Thomas Paine. Mr. T. J. Dibble, architect:

Putney	£3350 0 0
Inkpen	3023 14 7
Hamblin	2827 0 0
Lynn and Dudley	2660 0 0

WINTHORPE.—For additions to house at Winthorpe, near Newark, Notts, for Miss Wadd. Mr. C. Baily, architect:—

Fretwell (accepted)	£357 16

PROPERTY SALES.

MAY 26.

AT THE MART.—By Messrs. J. J. Clemmans and Son.—Leasehold two houses, Nos. 10 and 12, Bridport place, New North road, Hoxton, let at £30 each per annum, term 60½ years unexpired, at £4 5s. each per annum—£665.

By Messrs. Hofman and Son.—Leasehold residence, No. 1, Neptune villas, Mostyn road, North Brixton, let at £28 per annum, term 95 years unexpired at £3 15s. per annum—£250.

By Mr. T. Greenwood.—Leasehold residence, No. 2, Upper Bedford place, Russell square, annual value £130, term 33½ years unexpired, at £25 per annum—£1,075.

By Messrs. Prire and Clark.—Leasehold residence, known as Warwick house, Crowhurst road, Brixton, let at £70 per annum, term 93½ years unexpired at £5 per annum—£820.

Leasehold residence, known as Stanley house, Wiltshire road, Brixton, let at £75 per annum, term 94½ years unexpired, at £11 per annum—£820.

By Mr. George Berry.—Leasehold residence, known as Rose Cottage, Rose hill, Dorking, let at £57 15s. per annum term 45 years from 1847, at £5 per annum—£1,005.

Leasehold residence, No. 128, Upper Kennington lane, let at £35 per annum, term 54 years from 1833, at a peppercorn rent—£420.

JUNE 1.

AT THE MART.—By Mr. W. Thompson.—Freehold estate, comprising Barn house Farm, Great Bridge hill, Little Bridge hill, and Farley's Farms, in the parishes of Shipley and Thakeham, Sussex, containing about 193 acres—£3,500.

Freehold and leasehold estate, known as Gratwick house and Dawke's land, Billinghurst, Sussex, containing 33a. 0r. 26p. £2,100.

JUNE 3.

AT THE MART.—By Messrs. Norton, Trist, Watney, and Co.—Freehold 1a. 0r. 0p. of building land, situate at Leatherhead, Surrey—£180.

Freehold 5a. 0r. 24p. of building land, situate as above—£770.

By Messrs. Edwin Fox and Bousfield.—Leasehold two residences Nos. 108 and 110, Asylum road, Peckham, producing £60 per annum, term 99 years from 1851, at £18 per annum—£410.

Leasehold residence, known as Thornbury cottage, Anerley, Surrey, let at £80 per annum, term 99 years from 1854, at £12 per annum—£750.

By Mr. Nightingale.—Freehold farm homestead, with cottage, barn, stable, buildings, and 8a 0r. 25p. of arable and meadow land, situate at Claygate, Surrey—£710.

Freehold cottage and 3a. 1r. 11p. of orchard and meadow land, situate as above—£350.

Freehold farm house and, stabling, buildings, and 10a 3r 3p. of orchard, meadow, and garden ground in the parishes of Hook and Cressingham, Surrey—£1,560.

Freehold three cottages, adjoining above, producing £26 13s. per annum—£310

Freehold 1a. 2r. 14p. of building land in the parish of Hook, Surrey—£340.

THE BUILDING NEWS.

LONDON, FRIDAY, JUNE 19, 1868.

SCULPTURE IN THE ROYAL ACADEMY.

HOWEVER opinions may differ about the merits of the paintings in the Royal Academy exhibition, there can be no question as to the humiliating character of the Sculpture Department, which, as regards both purpose and achievement, surpasses in reckless demerit that of any previous display of the kind within our memory. It requires, at the least, no slight effort of resolution to descend to the cellars to which the productions of the plastic art are consigned; and when the grim array of libellous effigies, from stolid bust to colossal memorial, with all the intermediate variety of poetic and puerile conceit, breaks upon the eye, the irresistible impulse is to beat a hasty retreat, and postpone to another day the irksome and ill-rewarded duty of critical inspection. Thus it has happened that in our own case five or six several visits have been made to the Academic dungeon before we could collect the materials and compose our thoughts for the following notice.

Making our way up the steps after our last visit—which we hope will indeed be the last to this unpleasant hole—it occurred to us to inquire how it should be that the noble art of sculpture, the highest in rank of the fine arts, should have sunk so very low as to be almost beneath notice and beyond hope, whilst her more gaudy sister still flaunted it in the eyes of the multitude, and had her indiscreet admirers by the thousand. The answer was not long in suggesting itself. The secret of the decline both of painting and sculpture in the present day is the want of poetic inspiration in both, compelling a descent to trivial and vulgar themes. In painting, this deficiency may be compensated to the ignorant observer by the attractions of colour, the trick of atmospheric effects, startling dispositions of perspective, and last, not least, the rich paraphernalia of costume and other accessories which may be made to fill up the void of an empty conception *ad libitum*. In sculpture, on the contrary, the artist has a hard, colourless, inert material to deal with, which genius alone can invest with softness, mobility, and the play of light and shade which may almost supply the place of colour—a material whiter than the pallor of death, which the inspired hand of the poetic artificer alone can fashion into the similitude of humanity, with features endowed with intellect, feeling, sentiment, all, in short, but speech and sight, yet eloquent in their blindness and their silence, and appealing as a passive but unerring medium to the sympathetic recognition of the beholder. It was by this magic power that the Greeks absolutely realised an entire mythology in marble, each personage of which had its unmistakable individuality as to proportions, build, carriage, feature, and expression, becoming, in short, a type of its kind, according to the special attributes of the ideal divinity; and it is for want of this power, and for want of worthy purpose for its use, that the degenerate moulder and carver of the present age aspires at most to the imitation of the more salient features of each vulgar patron, and, discouraged too often by the unpleasing result, seeks relaxation and occasional attraction by the introduction of animals of the lower order, still life, extravagant costumes, furniture, &c. In a word, all the offences and weaknesses of portraiture and *genre*, which pass muster with the idle multitude on canvas, are now imported into the simpler and grander province of sculpture, perverting its noble resources to the basest uses. Nor is this all. We have only spoken of the evil in principle, not the practical results. One might be inclined to fancy that sculpture, in its original great scope and purpose, being extinct amongst us—its life, in fact, being gone—the art itself might die, or pass into desuetude. But not so. It happens that the plastic art having in its mechanic application but one requirement to fulfil, that of representing form, and the modelling of form being, with a little practice, one of the easiest things possible—witness the Tussaud Gallery and the models in the hairdressers' shops—the manufacture of statuettes in every variety of extravagance and execrable taste for the adornment of cockney villas becomes a prolific source of scandal and annoyance: and hence, with the addition of the portrait bust and the portrait group business, the profitable employment of the so-called sculptor, and the degradation of his art.

But, *revenons à nos moutons*, let us go through the hundredth exhibition of sculpture at the Royal Academy, as it is provided for us. We observe, *en passant*, that two sculptor academicians, Messrs. Foley and Westmacott, are altogether unrepresented on the present occasion. Looking to the solid considerations which one, at any rate, if not both, of these gentlemen has the pleasure of enjoying, in the shape of ample testimonial and portrait commissions, their absence from the competitive display which many of their fellows aspire to may perhaps be accounted for without any disparagement of the *status* and success achieved by them in their calling.

Conspicuous in the midst of the central cell is the model of a colossal group of Her Majesty and the late Prince Consort, habited "in early Saxon costume," which has been executed in marble by Mr. Theed, and erected at Windsor Castle. We confess ourselves somewhat at a loss to understand the *rationale* of this spacious performance. The motto appended is—

Allured to brighter worlds, and led the way.

The Queen is represented resting her right hand on the shoulder of the Prince, and looking up to him with an expression of devoted love, while he grasps her left hand and points upwards, as to "another and a better world." Supposing this to be a *post mortem* "testimonial," the idea of associating the living with the dead is an incongruity too obvious to need dilating upon. There is a parallel, in poetic story, in the scene between Hamlet and his father's ghost; but Shakspeare in this case did not fall into the absurdity of bringing the figures into contact. In pictorial treatment they might be, as they have been, represented with equal substantiality; but the only way in which the difficulty might properly have been got over in the vehicle of sculpture would have been to have represented the apparition of the deceased in relief, as distinguished from that of the living, which, treated in the round, might have reverentially and lovingly followed, as it were, into the recesses of the marble. Add to this that, whilst the face of the Queen, in Mr. Theed's work, is marked with much of the womanly feeling which might befit the supposed occasion, that of the Prince is sadly deficient in the intellectuality and dignity with which such a presentment ought to have been invested.

In connection with the late Prince, we are favoured with two colossal bronze figures, intended to be placed upon "the Prince Consort National Memorial" in Hyde Park. We can only hope, in the interests of metropolitan art, that the other decorations intended for that extensive and costly mausoleum may be more successful than these. In the "Astronomy," by Mr. H. Armstead, we have a colossal, heavily draped female figure, looking down upon a globe which she holds in her hand. With the sole exception that the globe in question is, upon examination, found to be marked with the lines appropriated to the celestial sphere, there is nothing in the whole composition which might not have been more appropriate to the genius of Geography than that of Astronomy. The companion figure, by Mr. J. B. Philip, represents "Geology," who also grasps a globe, the outer crust of which is partly fractured, and who looks upward, instead of downward. Which is "Astronomy" and which "Geology" any uninitiated spectator might well inquire, and the apt reply would be that of the Waterloo showman, touching the identity of Napoleon and Wellington—"which ever you please, my little dear."

His Grace the Duke of Beaufort has favoured Mr. J. E. Boem with a sitting, on horseback, in his full equipments as "Master of Hounds," the latter of which, including riding whip, top boots, &c., are conscientiously reproduced. Opposite this interesting sporting testimonial the same artist exhibits "The Hunter of Early Days," a rough customer indeed, seated, spear in hand, upon a shaggy pony, with a rough broken ground beneath. The artist ought to have been aware that, although a well-fitting hunting coat and a pair of well-fitting boots might be successfully reproduced by a modern Phidias, the ragged surfaces which he deals with in the companion subject are utterly inappropriate to sculptural treatment. Nevertheless, reduced to the dimensions of a statuette, and brought out under the auspices of the London Art Union, as a prize for its subscribers, this is just the thing which might have a certain success.

In poetic art there are few attempts, and those serving only to exemplify how true are our preceding remarks upon the extinction of poetry amongst us. Mr. W. Calder Marshall, R.A., presents to us a semi-nude commonplace model, with an arrow in her hand, which he denominates "Psyche;" but there is none of the soul of Cupid's hapless victim in the expression, and even the conventional wings, emblematic of the soul's evanescent character, are wanting. Still more unfortunate is the same artist with "Eve's Dream"—such a starveling is the mother of nations, reclining amidst a profusion of dishevelled hair, which looks more like a torrent of water gushing from the ground upon which she rests.

"The Octoroon," by Mr. J. Bell, is a palpable imitation of Power's "Greek Slave," handcuffs, chains, and all; but it is in every respect sadly inferior to its prototype, which itself was a much over-rated production.

Mr. J. Lawlor's "Titania" goes considerably out of the ordinary run of offence in female nudities, being a seated figure, graceful in contour, and with a soft persuasive intelligence in the expression. But what is to be said of Mr. G. G. Adams's "Youth Diving," a back view of an ill-conditioned lad, heels upward, his head about to bury itself in the mud of a sedgy shore—for the water is obviously only a few inches deep. We leave the artist to settle the question with an admiring public.

Mr. J. Durham, A.R.A., treads on safer ground when he dresses his buxom village girl "At the Spring" in good substantial boddice and petticoats, and his "Paul and Virginia" in equally unexceptionable attire. But, after all, these works do not aspire higher than those tea-garden decorations which many of us recollect in our earlier days, and which were generally manufactured in the humbler materials of wood or cement.

Professor Jerichau, of the Royal Academy of Fine Arts, Copenhagen, and a pupil of Thorwaldsen, has lately, thanks to his local antecedents, obtained a considerable share of patronage in illustrious quarters, and threatens to assume a position of dangerous rivalry to our native artists. His works, whilst occasionally indulging in the sensuous or the sensational, are, as far as poetic feeling is concerned, conspicuous for its absence. His "Leopard Hunter," with a blind cub leopard tucked up under his arm, whilst with the other he wields a spear to drive off the enraged dam, is a production by which nothing

is suggested either inspiring, pleasing, or instructive; and, therefore, as far as the purposes of sculpture are concerned, is a misapplication of labour and material. In his "Amor Triumphator," he represents the mischievous little god as a very steady, stern-looking boy, as far removed from either conceiving or inspiring a tender passion as the Psyche of Mr. Marshall. It would be droll to see the two introduced to one another, and imagine their little dalliances, which should inspire an Ovid or an Apuleius. Professor Jerichau's "Cupid" makes up for his want of personal merit by a profusion of gilding upon the helmet, sword, and various etceteras which surround him—instructive suggestions of the ruling principle of the day. M. Jerichau attones for his shortcomings in his two more pretentious performances, by an extremely pretty group in relief of "Greek Girls Dancing," which hangs on the landing-place beneath the Laocoon.

Mr. G. F. Watts, R.A., who affects old Venetian colouring in his easel productions, tries his hand in sculpture also, in a marble bust of "Clytie," obviously studied in emulation of the more charged and eccentric performances of Michael Angelo. It is described as being "unfinished." May it remain so!

The portrait busts, and indeed the "Vanity Fair" department generally, present few examples to call for notice as relieving the prevailing commonplace vulgarity. Mr. Weeks's bust of the late Thos. Statham, the artist, in exaggerating the somewhat peculiar features of the original, gives none of the amiable delicacy of thought which characterised him. Mr. Theed generalises and smooths away all the expressive bluntness which presents the "Earl of Derby" to the public mind as the *beau ideal* of "the fine old English gentleman." Mr. W. Graham caricatures the eccentric features of the late Lord Brougham, with a result beyond the most unkind imaginings. Mr. P. Hollins' full-length statue of Sir Rowland Hill, standing beside a pillar letter-box, and intended to be erected in Birmingham, by public subscription, is a fine specimen of coat-and-trousers testimonial sculpture. We cannot speak so highly of Mr. T. Sharp's Lord Palmerston, executed (by subscription) for the town and corporation of Southampton. The likeness is a poor one in point of features, and the jaunty daring of the "judicious bottle-holder" is hopelessly simmered away. In child subjects, Mr. A. Munroe indulges in his favourite mode of treatment in his marble group of the "Sisters," crouching together as if growing out of a flower-bed, with the faintest possible indications of anatomy in any one of their figures. Mr. J. Durham, A.R.A., makes a fearful exhibition of the four children of parents rejoicing in the name of Smith, "Sitting for our Portraits." The same artist realises a marvellous idea in the portrait of a little gentleman, *in naturalibus*, with a big sponge in his hand, "Waiting for my Bath;" and Mr. C. E. Smith has a little lady "Retiring from the Bath," which, though a portrait subject, is not without artistic interest. Mr. J. D. Crittenden's graceless little nudity, "Resting—a little weary of her play," is in every respect an offence, and ought to be removed or covered over.

NATIONAL EXHIBITION OF WORKS OF ART AT LEEDS.

SECOND NOTICE.

THE GREAT ITALIAN PAINTERS.

IT is singular that the brightest illustrators of any particular art should all burst forth at one and the same period. Such a constellation of poets and dramatists took place in Greece, where the space of a few years covers all the great names which have lived from that day to this. In sculpture it was the same, and in our own history the Elizabethan era held the best of our imaginative geniuses. We see the same law carried out in the history of painting in Italy, where at the commencement of the sixteenth century we find Leonardo da Vinci, Michael Angelo, Raphael, and Titian, all rivalling each other in the progress made in art. Of each of these masters and their attendant satellites—great artists, too, some of them—we have examples, or reputed examples, at Leeds. Nine pictures claim Da Vinci for their parent, but it is somewhat doubtful if more than two are descended in a direct line from him. Of these, the first which claims our notice is a lovely female face (No. 233), from the Duke of Devonshire's collection. It is in the early style of Leonardo, when he must have found such work dangerous, for even after this long lapse of years we can hardly look upon this painted semblance without a quickened pulse, so winsome is the smile with which both eyes and lips greet us. The face itself is one which evidently haunted Leonardo, for in many of his later works do we find the same pointed oval contour and the same rich rippling golden curls which we see here. That it was a labour of love with him we cannot doubt, for each minutiæ of her costume, each thread of lace, and every jewel which glistens on her bosom, are rendered with the utmost painstaking zeal, and, tied by a true-lover's knot, on her scarf are the initials "E. B." Who she was is not known, but on the back of the panel is painted a grim skull, with the inscription "Hieronymi—Casii—insigne." Beautiful as mysterious, we recommend this picture to Miss Braddon. Volumes of sensation may be obtained from it, and not even this result could make us love the face the less. Another work of his here is (No. 234) "Saint Katharine," from the Corsi Gallery, at Florence, where we see the same pointed oval outline of face, and where the virgin saint smiles so brightly as she contemplates the wheel of her torture and the palm branch of her martyrdom that the very angels who bear her company reflect it back again. None of the other works are at all entitled to the name they bear, and some are so very poor that we wonder at the hypocrisy which can be content with so very thin a mask. By Michael Angelo, that typical union of the arts, whose painting was sculpturesque, whose sculpture was picturesque, and whose architecture combined them both, we have one very interesting study. It is a small tempera sketch, the crude "blotting in" of his "Dream of Life," the dream of his "Dream," where a thousand floating ideas just leave their trace and go. The principal figure is almost the same as one of the well-known sculptured ones on the Medici tomb at Florence, and the whirl of the descending angel is magnificently managed. Of the three others attributed to Michael Angelo, only one has anything of his character about it; this is a Dantesque picture, by one of Michael Angelo's school, and represents—

> The infernal blast, increasing in its course,
> Hurrying along the miserable crowd,
> Whirling and tossing with resistless force.

Hustled and contorted in every manner, and in drawing much like Michael Angelo's. By Raphael no less than eight pictures claim to be—indeed, it is wonderful to see how many pictures by great masters there are in the world—if we take the names alone. Of these eight there is certainly not more than one which might be a Raphael, and even this is somewhat doubtful. The one we refer to is Lord Dudley's "Three Graces" (No. 218), a very much overrated work, most probably by Lo Spagna. It is very highly finished, and in very good preservation, and its *motif* is taken from the well-known sculpture in the library of Siena Cathedral; there is a little alteration, but only sufficient to translate sculpture into painting, and golden apples and coral ornaments are the only inventions of the painter, so, even supposing it to be by Raphael, we have only his hand and not his heart here. The only other picture having a fair pretext to the name of Raphael is one now pretty generally agreed to be Lo Spagna's. It is the well-known "Christ Bearing His Cross," and was exhibited in '57, at Manchester. The face is quite worthy of Raphael in its deep sorrowing look, but the head is too small for the rest of the figure, and the accessories of a pig eating thistles and the men driving an ass in the background at once would prove it not to be by one who took so much care in all his detail as did Raphael. Claim is made for *a* "Maddona del Cardellino," of Vallombrosa, as *the* original, and the one in the Uffizii, at Florence, called the copy. There is a large amount of documentary evidence to prove it so, but we fear the only truthful part about it is the present owner's name, M. Verity. As for the others they are simply impossibilities, without the slightest foundation for their fame.

To Titian are attributed no less than thirteen drawings, many of them well known to our readers as being from the Hampton Court collection. We have here his own portrait on the same canvas with Andrea Franceschini, the Chancellor of the Republic, who wears the crimson robe of the order of St. Mark, and who is in the catalogue called "Pietro Aretino," according to the rule laid down by the Executive that they will call all pictures just soever what the owners please. Strangly enough a real portrait of "The Friend of Titian and the Scourge of Princes" turns up here from Sir Stirling Maxwell's collection, where, still more strangely, it is called a "Portrait of Ariosto." The keen eyes of Mr. Redford, the assistant commissioner at Leeds, discovered the words "Petrus Aretinus" on it as soon as it arrived, and have added another to authenticated portraits by this wonderful and prolific artist. An odd misnomer of a portrait occurs in No. 237, which is now called "Allessandro de Medici," but which has once before done duty as a portrait of Boccaccio, and been engraved as such. But there is one still more curious, in No. 287. This is called a portrait of "Ignatius Loyola." It is a fine handsome youth, with face and eye radiant with poetic inspiration; his hands hold the olive crown and the palm branch, at his feet lies a quiver of arrows, and round his head a thin line nimbus. Now we know that no portrait of Loyola was known to be taken during his life, but that all that exist were taken from a wax mask prepared after death. He was not canonised till about a hundred and fifty years after Titian's death, neither did he suffer martyrdom, nor is there any resemblance to the features of Rubens' well-known portrait at Warwick Castle. Name-givers should have some ground to go upon, but the horror of the words "portrait unknown" in their catalogue seems to drive them to madness: hence this recklessness.

There is one fine head here, which, if not properly named, is happily selected. It is that of "Ginlio Clorio" (244), from Colonel Towneley's gallery, and we fancy we can trace in the keen, observant face the lineaments of the celebrated minaturist, the greatest and last of that old race of illuminators of manuscript. The printing press was gradually exterminating. The "Lucretia," from Hampton Court, and a dubious landscape are here, with some others of still more questionable reputation. Of Fra Bartolommeo there is a charming example from Lord Wenlock's gallery, representing the meeting of Saints Francis and Domenic—those simultaneous founders of the mendicant orders who divided the world between them. It is full of poetry, and none can see its quiet tone without feeling some reflex from the deep pathos it contains. Worn and weary with the work of their life, these two old men meet in its evening, but with a serenity as unsullied as the sunset sky behind them, and we feel that the "*Pax vobiscum*" each utters is but the echo of that greater peace which reigns within. Scarcely less beautiful is a "Madonna and Child" by him, from Earl Powys' collection (No. 263). We see in it much of the beauty of colouring Raphael

learned from him; indeed, the drawing is highly Raphaelesque. A very charming specimen of Andrea del Sarto is No. 258, also from Lord Wenlock's gallery, and is highly characteristic of the master. The other claimants for the honour of being his work are most of them worthless, and have not the slightest resemblance to the very marked and peculiar style of this clever but unfortunate artist. From Pamigiano we have a wonderfully decorative little picture of a round of children dancing on the deeply recessed ledge of a window. All races are here, from the dusky Ethiope to the fairer European, and as they swing round in their circular dance all varieties of position present themselves, each seeming more beautifully rendered than the other. This is one of the most graceful pictures in the exhibition, and presents many useful hints to decorative artists. Above this hangs a picture more interesting from the man who did it than what he here did. It is by old Giorgio Vasari, the gossiping chronicler of art history and scandal, from whose works all writers since have dug their precious stones, to set them as they pleased.

Paulo Veronese is represented by a caricature of his "Marriage at Cana," and a very good school drawing of his "Banquet in the house of Levi," and his grand architectural treatment is quite worthy of memorandum by our professional visitors.

The minor artists of the various Italian schools are well represented, but it would occupy too much of our space, and too much of our readers' patience, were we to comment upon them all, and next week we purpose giving a brief summary of the exhibits in the Spanish, French, and German schools.

THE ARCHITECTURAL EXHIBITION, CONDUIT-STREET.

THIRD NOTICE.

IN the designs for churches at the Architectural Exhibition reviewed in our last notice it is worthy of remark that all those intended for Roman Catholic worship, by Messrs. Willson and Nicholl, Messrs. Hadfield and Son, and Mr. Goldie, show an inspiration drawn almost exclusively from foreign models. Early French Gothic, is the type followed by these architects in the main, though Italian influence is observable in the windowless east end of the church at Marylebone (No. 40), which is treated after the manner of Mr. Butterfield's east ends of the churches of St. Albans and All Saints'. Whereas in the works by Mr. Street and Mr. White, which are intended for the use of the Established Church of England, a pure English style, that which obtained in the Early Decorated period of architecture, has been adhered to throughout. There may be a consistent reason for each of these different practices, seeing that the one church acknowledges the reigning sovereign of the land and the other a foreign potentate as their heads respectively; and it may be desirable that such a distinctive difference as that noticed should characterise the structures erected by them. With such reasons as these we have nothing to do, further than that in the former instances an excuse is afforded for a departure from the course which we would strongly urge upon English architects as a rule—we mean that they should take their beautiful national style as the groundwork upon which to form their own. We are glad to see on the part of Mr. Street, for instance, an abandonment of the bald plate-tracery and stumpy columns which injured many of his former designs, and which has proved so infectious a disease among his imitators; and we hail this change with hope for the great work upon which he is about to be engaged. And though we have felt it necessary to speak strongly with regard to some points in the designs by Mr. White, reference to the photographs of his executed works (Nos. 348 and 353) may be made as furnishing examples of the general "character and dignity" we have remarked as generally distinguishing his works. The same may be seen, accompanied with some regrettable crotchets, in his noble church of All Saints', Notting Hill, which is represented in these photographs.

During the past year several limited and unlimited competitions have occurred for churches intended to accommodate large congregations, varying from 1,000 to 1,200 persons, viz., at Ryde, Dorchester, Lincoln, Great Yarmouth, and Slough, and these have unquestionably called forth a large amount of talent, and as the problem sought to be solved in them all is one of great practical as well as artistic interest to the public, and to the profession, we intend to devote some consideration to them.

It is unfortunate that more of the successful designs are not exhibited here, so that they might be compared with the unsuccessful ones; that by Mr. Seddon for the church at Great Yarmouth is, in fact, the only "selected" design in the room. Of the Ryde Church we have the designs by Messrs. Driver and Payne (Nos. 170 and 182), the exterior of that by Mr. Conybeare (No. 189). In the BUILDING NEWS for June 5, we engraved side by side the former of these and the accepted design by Mr. Peachey, of Darlington; as also the interior view of Mr. Conybeare's. In the case of this church the choice of the committee does not appear to have fallen upon the best design; but though Messrs. Driver and Payne's design was superior to that by Mr. Peachey, which bristled with useless pinnacles, we must own it was itself far inferior to many of the designs sent for the other churches above named. The way in which the circular apse is frittered into stripes by buttress pilasters, the unpleasant tucked-in appearance that it has beneath the sills of the windows, and the too great contrast occasioned by the crowding of the pinnacles and lucernes at the base of the spire above the simple tower are great drawbacks to a design otherwise meritorious. Mr. Conybeare's design is an unpractical dream based upon the study of stately German Romanesque cathedrals and churches, the interior view of which, referred to above, was far superior to the exterior, a perspective of which is here exhibited. Mr. Conybeare also sends his design (No. 188) for the narthex or western porch for the Dorchester Church, founded upon that which exists at St. Andrew's Church at Cologne, which, though picturesque, and, antiquarianly speaking, interesting enough in the original, is not the sort of thing that would be tolerated in modern work. We may remark that the curious Saracenic cusping is in that ancient example confined to the soffits of the transverse arches, the wall ribs being judiciously left as plain roll mouldings, and the effect is infinitely better than here, where a questionable idea seems worked to death. Yet Mr. Conybeare without doubt deserves praise for his laudable effort to develope the Romanesque style for modern uses. To attain success, however, he must descend considerably more into the region of common sense and abandon this exclusively German type, in which there is far more to avoid than to copy. We have been told that the cost of the selected design for this church at Ryde having proved beyond the estimate, it and its author have been set aside, and that the work has fallen into the hands of Mr. Gilbert Scott. If this be the case, though the folly of unlimited competitions may have met with a deserved check, we are at a loss to understand how the glaring injustice done to the other competitors, who cannot all have erred alike, is to be explained, or the conduct of the architect who has lent himself to such a proceeding. For a church at Hemel Hempsted there is a simple and fair, but ordinary, competitive design by Mr. Henry Hall (No. 39); but his design submitted for the Dorchester Church is very inferior. In the competition for the church at Lincoln greater care was taken by the committee to ensure that the competitors should be architects of standing and experience, and the result, compared with that at Ryde and Dorchester, showed the wisdom of this course. Here, again, we have to regret the absence of the selected design, which was by Mr. Fowler, of Louth, and this we do the more, because we learn that it was not the one which was placed first on the list by the professional architect who acted as the adviser of the committee. We shall not attempt, therefore, to class those designs for it which are here exhibited, but simply to give our opinion upon them individually. No. 106 shows the exterior and No. 107 the interior of the design by Messrs. R. Phené Spiers and Michael Drury. These have the appearance of being careful and meritorious studies, and many parts of the design are simple and well-treated in themselves, but they are not harmoniously combined. The French-looking, dignified, and well-treated plate-traceried clerestory of the nave is out of keeping with the modestly proportioned English Gothic arcade, the treatment of the capitals of which is the only bond of union. The chancel and tower are more ambitious and less successful. The former is vaulted and square without, though treated with the effect of a polygonal apse within (a novel idea),* the effect of which is good internally but not so externally. The gables above the belfry windows of the tower piercing and rising above its cornice assist some equally ill-placed angle pinnacles in effectually spoiling an ordinary broach spire.

The plans for this church by Messrs. Giles and Robinson (Nos. 227, &c.), and Mr. Seddon (Nos. 220, &c.), are, like those for the Yarmouth Church, by the same architects, in strong contrast; the former have striven to accommodate the large number required by naves of moderate size and width, with double side aisles, while the latter makes his aisles quite subordinate to his naves, which are of no less than about 40ft. wide, but, evidently for economy, of very moderate height. Necessarily, in like contrast, is the multiplicity of parts and features in the one case, and their extreme fewness and simplicity in the latter. Thus the number of windows is at least threefold in the designs by Messrs. Giles and Robinson to those by Mr. Seddon, while the internal arches and columns would be in still more striking disproportion, and a comparison of the relative sizes of these features would be in inverse ratio. Perhaps these characteristics are severally carried to excess. Mr. Seddon seems to think nothing of arches of nearly 40ft. span, or of windows of greater width than ordinary churches, and we should certainly advise his reconsideration of the bulk of some of his piers, and his great gabled aisle windows of the Lincoln Church would need more space of masonry in the gables over them to produce a good effect. Messrs. Giles and Robinson's designs are set forth in bright and clear sepia drawings, and are full of graceful and pretty points; the north side of the Lincoln Church, which has but one aisle, is the better elevation of the two; and its continuously ranged clerestory and aisle windows, with good height of walling below them, are the best features in the design. The towers and spire in both these designs are over-laboured with no very successful result.

For the Yarmouth Church, the number of competitors of which was limited to six, we have the designs by the local architect, Mr. Bottle (Nos. 55 and 60), and those by Mr. Seddon (Nos. 226, &c.), and Messrs. Giles and Robinson (No. 382, &c.) Mr. Seddon's were evidently selected for the simplicity of his plan; and certainly he seems to have made the most of it, enclosing an awkwardly square plot of ground to its very verge, with only eight points of internal support. A nave and transept of the width of about 40ft., which he seems usually to adopt, cross each other, and divide the plan into that of a Greek cross, the re-entering angles being filled up by side aisles roofed parallel to the nave.

* An ancient example somewhat resembling this may be seen at Tour-en-Bessin, near Bayeux.

The nave and aisles, as if for economical reasons, are low (too low we think) and of nearly equal height. A simple and bold tower, with lead-covered spire, is advanced at the north-west angle, and serves to conceal the shortness of the building. Messrs. Giles and Robinson's design is so similar to the one by them which we have described as to need no further remark, with the exception of the novel and striking arrangement of its triple chancel arch, which is only carried up to the height of the wall-plate; having no wall to support, its object is purely ornamental, and we should have preferred a more obvious screen, particularly where economy was an object to be sought. This economy has been well studied in Mr. Bottle's design (No. 60), which has many fine features besides. Its general aspect is that of one of the great Belgian churches, but, from the limited nature of the site, painfully cramped in point of length. The nave is of great width and sufficient height, and has one aisle on one side and two on the other, the outer one of which is very narrow and roofed with a succession of large dormers, which give the appearance of external chapels, and which need much greater space of masonry in their gables. This aisle is divided from its neighbour by very depressed and ugly arches. The tower, also, at the north-east angle, is bold, and would pass muster among other oddities of its class in one of the cities of the Low Countries, but we fervently hope to see few such erected in our own English towns. A depressed spire rises out of a complicated belfry stage, which has angle turrets, and is placed upon a very simple tower with long shallow recessed panels, like one we remember at Bruges.

Messrs. Francis send drawings and photographs of several churches, of no very great originality or merit, but from these we may except their new parish church at Warrington, in Lancashire, just completed (No. 357), as being a fair example of a stately type of Middle Pointed, with a fine tower and spire of the class of those of Grantham and Newark. In fact, the church has in the photograph much the appearance of having grown up at various dates—depressed, heavily coped aisles by the side of an earlier and more acutely gabled nave, flanked by pinnacles which have an ominously modern-looking efflorescence of bunchy crocketing. For such a church, even if a reproduction only of a good old type, we are thankful; whereas it is with something less than complacency that we learn that No. 171 (St. Paul's Church, at Brentford) is being erected after so indifferent a design by the same architects. That that shown in the (No. 144) exterior view of St. Jude's Church, East Brixton, by Mr. E. C. Robins, or No. 186 (Christ Church, Herne Bay), by Messrs. George and Vaughan, are in actual course of perpetration can be only a cause of grief to all concerned; and No. 53 (Cemetery Chapels, Diss, Norfolk), J. W. Muskett, architect, is another lamentable addition to the number of deformities with which the "God's Acres" of our day are afflicted. Mr. Bottle, in his views of Congregational Chapel about to be erected at Great Yarmouth (No. 45), has been so far less fortunate than in his design for the church we have before referred to that it is difficult to conceive that the two designs or drawings have issued from the same source. Among the poor versions of French Gothic we are obliged to class No. 96, a design for new church at Lennoxville, Canada West, by C. Hodgson Fowler. We far prefer to it the photographs of his Church of St. Ive's, Leadgate, Durham (No. 339), which seems stern, simple, and satisfactory enough. Near it is No. 337 (photograph of Abbey Cwm Hir Church, Radnorshire), which is well studied, but of too startling an Early French type for such a locality. No. 347 (St. Saviour's Church, Croydon), by Messrs. Mullins, Lee, and Mullins, is of a "Victorian" style, of which we desire to see little. No. 355 (photograph of design for interior of chapel of Bedford Middle-class Schools), J. Usher, architect, drawn by J. Johnson, is hung too low for examination, but seems to be really good. Nos. 359 and 360 are an exterior and interior view of Church of St. John, Alloa, N.B., by R. Anderson, which is also good and unpretending, but the buttresses to the tower are carried up too high without diminution, and oppress and hide good belfry couplets. No. 190 is a quaint design for a new church now being erected at Worthing, by George Truefitt, effectively and cleverly coloured, but the style is too eccentric. Its great baseless circular apse seems to have sunk into the ground, and the simple and good tower and spire are spoiled by windows, which may be called belfry and lucernes combined, and which break most unfortunately the necessary continuity of the cornice. But such mild eccentricity pales before that which characterises the design shown in the queerly coloured drawing (No. 160) of the Church of the English Martyrs at Preston, by E. Welby Pugin. This is a pretentious building, with a lofty nave and squeezed-up aisles, and a tower which seems to have quarrelled with both and taken up a position at the side, thus leaving an ugly gap in the façade. Both tower and nave are covered with exaggerated lanky pinnacles, with an eruption of spiky little gablets. One of these pinnacles bestraddles the apex of the nave gable, by the help of a corbel of most comic description, and two or three seem to have got piled one on top of another, in order to emphasize the parapet of the tower. The tower, square and plain at base, must be at that part nearly solid, to allow the four octagonal turrets to spring out of it above, as they do, and yet to leave the wall between as thick as the deep recesses of its windows would make it appear. In fact, the whole thing is redolent of nightmare.

Several frames of photographs of executed designs are exhibited by Mr. Goldie, and show much vigour of thought and careful design, but we much desiderate in them greater temperance in the use of Early French Gothic detail and a lighter handling. The tabernacling above the altars of St. Wilfrid's, York, and St. Alphonsus' Church, Limerick (Nos. 373 and 356), are fussy and overdone. In one a range of statues under heavy canopies seems to crush the lower part of the altar, and a low altar screen has a range of stumpy columns in front, which have nothing to support, and which are quite out of scale; we also object strongly to the sort of Louis Quinze scrollwork which corrupts his Early Gothic foliage of his fine doorway at York. In No. 378 Mr. Goldie exhibits a stately new tower to a fine old church, injured, however, by gables breaking through the cornice, as noticed in other designs above. No. 390 (St. Silas's Church, Sheffield, by Blackmoor and Withers) is a very indifferent design. Having thus exhausted the designs for churches which seem to deserve notice, we must reserve the domestic examples to another opportunity.

SHAKSPEARIAN CURIOSITIES.*

It is very nearly seven years since the Shakspeare Fund was established to accomplish the following objects:—1. The purchase of the gardens of the poet at the New Place. 2. The purchase of the remainder of the birth-place estate. 3. The purchase of Anne Hathaway's cottage, with an endowment for a custodian. 4. The purchase of Getley's Copyhold, Stratford-on-Avon. 5. The purchase of any other properties at or near that town that either formerly belonged to Shakspeare or are intimately connected with the memories of his life. 6. The calendaring and preservation of those records at Stratford which illustrate his life, or the social life and history of the town in his time; and, 7, the erection and endowment of a public library and museum at Stratford. The efforts of the Fund Committee during these seven years have been so far successful that we understand three of the most important of the objects enumerated may be said to be accomplished, including the formation of the valuable collection known as the Shakspeare Library and Museum now preserved at Stratford-on-Avon. A descriptive catalogue of this unique collection has just been published in a volume of nearly 200 pages, and containing as many as 1,148 entries, more or less interesting. Indeed, considering the meagreness of our information touching the personal history of Shakspeare, we must regard this collection of books, MS., works of art, antiquities, and relics as a very remarkable one. A brief analysis of the catalogue will enable the reader to judge for himself, and to form a tolerable notion of the nature and extent of the Museum. It seems desirable, by way of introduction, that we should state a few particulars concerning Shakspeare's house itself, in which these relics are lodged. Through the selfishness of a lazy parson, one Francis Gastrell, its then unworthy possessor, the house where Shakspeare died was razed to the ground about a century or more ago "in revenge for an assessment." The said gentleman about the same time also cut down the famous mulberry tree planted by the dramatist rather than take the trouble to show it to visitors. Luckily for us this reverend vandal had nothing to do with the first home of the poet. That hallowed place is still preserved to us. The house stands at the north-west end of Henley-street, Stratford, and is a comfortable and respectable habitation of the early part of Elizabeth's reign. It consists of a framework of timber formed in squares, with the intervening compartments filled up with mud and plaster—locally termed "wattle and dab"—latticed windows, and high-pitched gable roofs. Warwickshire still contains a number of similar edifices. Shakspeare's father, in 1574, purchased this house and another for the sum of £40. At his death, in 1601, they became the property of his eldest son, William, who bequeathed them in succession to his daughters Susanna and Judith. Lady Barnard, daughter of the former, and the last surviving descendant of Shakspeare, left the tenement to Thomas Hart, the grandson of the dramatist's sister Joan, and in his family they continued until the year 1806, when they were sold to a stranger for £250. The house in which the poet was born underwent great alterations about this time. The old dormer windows and the porch were removed, and other "modern improvements" were effected on it. Originally it seems to have formed one residence, but it was now divided. The western portion, containing the birth-room, was tenanted by a butcher, the other division being the "Swan and Maidenhead" Inn. This portion was afterwards fronted with red bricks, which of course further destroyed its original character. The house was kept open as an exhibition until 1847, when it was put up for sale by the well-known George Robins, and became national property, having been purchased for the sum of £3,000, raised by public subscription. It was then carefully restored with as satisfactory a result as could be hoped for. Entering this interesting edifice from the street, the visitor passes into an apartment, long occupied as a butcher's shop, but no doubt once Shakspeare's kitchen. Behind this is the dwelling-room of the family, from which a narrow stair leads to the very room in which, there is the most probable ground for believing, the poet was born. This chamber fronts the street, being immediately over the kitchen, and is lighted by a latticed window. The ceiling is remarkably low, only a little more than 7ft. above the floor, and ceiling and walls alike are literally covered with names and inscriptions in every language. Apropos of these names, many of them the autographs

* "A Catalogue of the Shakspeare Library and Museum, Stratford-on-Avon." London: Printed for the Shakspeare Fund. 1868.

of the most celebrated characters of their time, it is recorded that a woman in former days occupied the house as tenant at the yearly rent of £10. The proprietor, finding the visitors numerous, raised the rent to £40. In consequence the woman left, and, "to wreak her spite against the owner of the house, she, previous to quitting it, whitewashed the birth-room, thus inflicting, as she imagined, an irretrievable injury on the property. The whitewash, however, proved less adhesive than was anticipated, and was, with a little trouble, successfully removed." The museum is in the eastern portion of the building, formerly the Swan Inn. For the better preservation of the Shakspeare House no fire or candle is allowed in the building, which is, however, protected from the destructive influence of damp by hot water pipes, introduced from a tenement at a little distance. To give a detailed list of all the Shakspeare relics deposited here would be impossible, but a few of the more interesting may be mentioned. The number of entries in this catalogue amount, as we have stated, to 1,148, and the collection is made up of presentations from various gentlemen, who may be said to have devoted their lives to the study of England's greatest poet, and to everything connected with his name. Mr. J. O. Halliwell, the well-known Shakspearian scholar, has given to the museum about 450 books and papers of the greatest value, many of them edited by himself. Valuable bequests have likewise been made by Mr. F. W. Fairholt, F.R.S., Mr. J. Payne Collier, Mr. Hunt, town clerk of Stratford, Mr. J. D. Denman, B.C.L., the late Captain Saunders, and the late Mr. R. B. Wheler, of Stratford. For upwards of half a century Mr. Wheler diligently occupied himself in the completion of one of the most remarkable local and antiquarian collections ever formed by a single individual. It was generously placed in the museum after his death in 1857. Mr. Wheler was the author of several works on the history and antiquities of his native place (which it was his chiefest pride to think was also Shakspeare's); and of his "Collectanea de Stratford," a MS. work, it is remarked: "This marvellous example of the results of unrivalled industry and accuracy in 536 quarto pages, is so minutely written that a transcript in ordinary caligraphy would fill half a dozen volumes of a like size." Indeed, it is chiefly to the labours of this gentleman and Mr. Halliwell that we owe this museum, as well as much of our knowledge regarding the great dramatist and his works. The first noteworthy feature of the collection is the vast amount of Shakspearian literature that has been brought together. Besides the first, second, and third folio editions, dated 1623 (a large fragment only), 1632, and 1664, there are between forty and fifty complete editions of Shakspeare's works, numbering in all nearly three hundred volumes. This does not include copies of single plays, or portions merely of the works published separately. Nor does it include "Studies from Shakspeare," "Beauties of Shakspeare," and books of that class. These are so numerous that alone they form a large and valuable library. Mr. Halliwell has written a list of one thousand volumes of Shakspeariana, which have been published. The library also contains upwards of a score of Lives of the Poet, and the originals of various legal documents relating to Shakspeare and his family, on which much of the information that we now possess regarding him is founded. Among these is a deed executed in 1596, which proves that the father of the poet resided in the house now shown as the birthplace. The discovery of this document only a few years ago cleared up what was looked upon by some as a doubtful point. The deed has the mark attached to it of John Shakspeare. It is further interesting to note that notwithstanding Shakspeare's father married a woman of gentle blood and culture, Mary Arden, the heiress of Asbies, and that he himself was a man of undoubted business capabilities who rose to be chief magistrate of Stratford, yet neither John nor Mary Shakspeare were able to write their own names. Then we have the celebrated letter of Richard Quiney, whose son afterwards married Shakspeare's daughter Judith, asking for a loan of thirty pounds. It is dated 1598, and is the only letter addressed to the dramatist known to exist. There is a deed dated 1609, with the only autograph extant of Gilbert Shakspeare, his brother, and a conveyance of premises in Sheep-street, 1599, with the autograph of Hamnet Sadler, as a witness. Sadler was a legatee and a witness to Shakspeare's will, and was godfather to the poet's son, who died in 1596, at the age of 12. The will itself is here, or rather a copy of it, the original being preserved in Doctors Commons. It was executed on March 25, 1616, not quite a month previous to his death. It is the most important document existing relative to the poet. The three signatures attached to it, with two others appended to deeds relating to property in Blackfriars, constitute the only undoubted signatures of Shakspeare that we at present possess. These deeds are in the Guildhall library. A gold signet ring which was picked up in 1810, by a workman in a field adjoining Stratford Church, is presumed to have belonged to Shakspeare. It is inscribed with the initials "W.S.," with a true-lover's knot between the letters. This relic is exhibited together with a sword and a pair of stirrups said to have been the poet's; a piece of wood taken from his pew in the parish church; an ancient desk removed from the Grammar School; and traditionally believed to have been that in which he sat, and his jug of ancient glass, from which Garrick drank wine at the jubilee in 1769. Nor should we forget to mention an old chair, known as Shakspeare's, from the Falcon Inn, at "Drunken Bidford," with the old sign of that tavern, at which, according to the well-known story, he repaired to drink not wisely but too well. There is any number of articles in the shape of caskets, snuff boxes, tobacco stoppers, and paper knives made from the celebrated mulberry and crab trees, concerning which we have heard so much, and know so little. The portraits of the poet here form an interesting collection. We note engravings of the Chandos portrait, now the property of the nation, by Howbraken and Cousins, with a copy in oil and a lithograph of the same; also a lithograph of the Felton Shakspeare, with a likeness in crayons by Mr. Fairholt, and an engraving from the Jansen portrait, Dunkarton Sculp. 1811. An oil painting, described as being a "vile daub," finds a place on the wall, because it was in the possession of the Hart family at the birth-place in the last century. Besides these we have a photograph of the *proof* impression of Droeshout's engraving of 1623, and the Ely portrait, so called from its having belonged to the late Bishop of Ely, by whom it was highly prized. Perhaps the most interesting copy of the Chandos is one in crayons by Ozias Humphrey, R.A. (1783), which was executed expressly for Malone, who on the back has written that it is a very faithful copy, and in his opinion invaluable. The poet, he thinks, was about 43 years of age when this portrait was painted. There is no likeness of Shakspeare, as has been remarked, which has enjoyed a greater celebrity, or realises to the imagination a more pleasing image of the features of the Bard of Avon than the Chandos. Dubiety, however, attaches to this famous portrait, and although the Droeshout is not so prepossessing a likeness, it is the more genuine and valuable memorial. The Stratford portrait, as it is called, having been found in an old house there about a century ago, is also doubtful, though curious in its way. It is the only painting of old date which represents the poet in the same costume in which he appears in the monumental effigy in the church. Still it is not supposed to be older than the last century. The bust over his grave in Trinity Church is, after all, the best authenticated likeness of Shakspeare that we possess. It dates from within seven years after his death, and it is believed to have been executed under the direction of Dr. Hall, his son-in-law, the sculptor being Gerard Johnson, an artist of Dutch extraction resident in London.* The Museum possesses several other works of art, including portraits in oil of Garrick and Mrs. Garrick, one or two curious old views in oil of Stratford taken about 1750, an original portrait in oil of Sir Hugh Clapton, who resided for many years at New Place, and died there in 1751. It is painted by Thomas Murray, a distinguished portrait painter in his day. Mr. Halliwell contributes a large oil painting of Windsor and the castle, of the time of William the Third, showing the street where Falstaff is said to have been carried down in the bucket-basket. This very interesting picture, and another of the same date, apparently by the same artist, in Greenwich Hospital, are believed to be the two earliest paintings in Windsor known to exist. Space forbids our pointing out many interesting articles discovered in making recent excavations at New Place, where Shakspeare resided during his latter years, as well as a variety of other objects which lend additional value to the collection. On the whole, the Stratford Museum is a cabinet of curiosities perfectly unique, and one of the most interesting not only in the kingdom, but in the world.

THE ARCHITECTURAL ALLIANCE.

THIS association, which has not hitherto been signalised by very marked success, will hold its seventh annual meeting on Thursday, July 2, at No. 8, Montague-street, Russell-square, at ten o'clock. The following delegates are appointed to attend:—

LONDON ARCHITECTURAL ASSOCIATION. — T. Roger Smith, F.I.B.A., Thomas M. Rickman, F.S.A., A.I.B.A. (secretary *pro. tem.* of the Alliance), J. Douglass Mathews, A.I.B.A., R. Phèné Spiers, A.I.B.A.

ARCHITECTURAL INSTITUTE OF SCOTLAND.—J. D. Peddie.

BIRMINGHAM ARCHITECTURAL SOCIETY.—J. H. Chamberlain, F.I.B.A. (president of the Alliance), T. Plevins, W. Harris.

GLASGOW ARCHITECTURAL SOCIETY.—Alexander Thomson, John J. Stevenson.

LIVERPOOL ARCHITECTURAL SOCIETY.—G. E. Grayson, H. H. Statham, jun.

MANCHESTER ARCHITECTURAL ASSOCIATION.—Lawrence Booth, A.I.B.A., Peter B. Alley, jun., Alfred Darbyshire, A.I.B.A.

NORTHERN ARCHITECTURAL ASSOCIATION.—R. J. Johnson, F.I.B.A., Thomas Oliver, F.I.B.A., Francis Charlton, C.E.

NOTTINGHAM ARCHITECTURAL ASSOCIATION.—T. C. Hine (treasurer of the Alliance), Frederick Jackson.

The chair to be taken by the president, J. H. Chamberlain, of Birmingham, and the following important business is to be attended to:—

1.—Read minutes of meeting, 1867.

2.—Read report for last two years.

3.—Receive resolution of the Bristol Society to retire from the Alliance.

4.—Report any resolutions of the allied societies respecting Mr. Hine's paper "On the Propriety of making the Bills of Quantities a part of the Contract."

5.—Report any further proceedings with reference to Mr. Plevins' "Form of Contract and Conditions."

6.—Receive delegates from the General Builders' Association.

7.—Election of officers.

8.—Present and discharge accounts for two years ending June 30, 1868.

We think the best friends of the Alliance will admit that the destinies of architecture are not likely to be materially affected whatever may be the fate of the above programme.

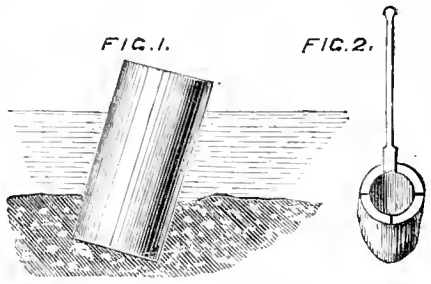
* The wretched Malone bribed the sexton of Stratford Church to let him whitewash the painted effigy of Shakspeare which stood there, in rude but lively fashion depicted, to the very colour of the cheek, the eye, the eyebrow, hair, the very dress he used to wear—the only authentic testimony we had, however imperfect, of these curious parts and parcels of him. By ——, if I had been a justice of the peace for Warwickshire, I would have capt both the commentator and sexton fast in the stocks, for a pair of meddling, sacrilegious varlets.—CHARLES LAMB.

ELEMENTS OF ENGINEERING.

Sinking Piles and Caissons.

THE different descriptions of foundations ordinarily used under water have been already treated of in our previous articles, and the various methods practised to overcome what is undoubtedly the chief difficulty attending all architectural and engineering structures fully investigated. It now remains for us to briefly describe the manner in which artificial foundations, such as piles, cylinders, and caissons, are got into position, and secured upon a firm and reliable basis. Timber piles, from their great antiquity, deserve first mention, although some of our readers might be inclined to consider them as rather obsolete. But those who have witnessed the extensive scale upon which they have been employed in the dams for the Thames embankment walls, and in numerous other large works in London, cannot fail to perceive that they will in a great measure continue to form an important part of the construction of all temporary works, even supposing that they are in future excluded from participating in permanent ones, an assumption we do not altogether concur in. The driving of ordinary timber piles, whether that operation be accomplished by the simple plan of letting a ram or monkey, as the weight is termed, of so many hundred weight fall directly upon the head of the pile, or by driving it down by steam power, is too well known to need a detailed description. Cast-iron piles may be driven in the same manner provided a block of timber is placed upon the top to deaden the force of the blow and diminish the actual impact. Otherwise, without this precaution there would be danger of the head of the pile being fractured in the driving. Cast iron piles, forming the sides of the caissons used in the foundations of Westminster Bridge, were driven in this manner with complete success. Screw piles are got in by means of a capstan and bars, which may be worked by hand or animal power. On the Bombay and Baroda Railway bullocks were used to turn the capstan that screwed home the piles into the bed of the rivers. Both piles of timber and of iron are got down with comparative facility when contrasted with cylinders and caissons. These latter enclose an area, which is of some extent in the former instance, and of very considerable amount in the latter.

There are three methods of sinking cylinders and caissons down to their proper depth. The first, which is unquestionably the simplest and the best under all circumstances, is by the method of dead weight, which consists in loading the cylinder on top with pigs of iron, castings, large masses of stone, and, in fact, any heavy material that may be at hand, until it cause it to descend to the required depth. A glance over the parapet of the temporary Blackfriars Bridge will demonstrate how the caissons employed in the construction of its successor are weighted. It will be readily understood that cylinders will not always sink uniformly. Should they happen to meet with a particularly hard bit of ground or some obstruction in the shape of a boulder upon one side, while the ground at the other is comparatively soft, they will sink more at the latter than the former side. The result of this will be that they will get out of the plumb and tilt up on one end. This is shown in fig. 1, drawn of course to an exaggerated scale, to show the thing plainly. Two courses are open to attempt to remove the obstacle. The one, and the more obvious, is to shift some of the weight from the lower side of the cylinder to the higher, and to add more, if necessary, until the high end is got down to the same level as the other, and the cylinder rights itself. In the majority of instances this plan will be found successful, but sometimes it will fail to accomplish the desired purpose. As a *dernier ressort*, divers are then sent down, who clear away the obstacle, or loosen the ground sufficiently to allow of the descent of the cylinder. The bed of the Thames presents very few impediments of this description, the cylinder and caissons, as a rule, sinking very gradually and uniformly down to their levels.



When the depth to which the cylinders have to be sunk is not considerable, the excavation of the earth inside is effected by means of scoops or spoons, similarly to that represented in fig. 2. These scoops are provided with long handles, and are furnished with a leather bag or pocket in the middle. After some time and practice the excavators are able to manage these scoops with great ease and dexterity, although upon first trial they prove very unwieldy instruments. The depth being too great for the use of these scoops after a certain portion of the sinking has been effected, the aid of divers is had recourse to. Formerly the diving bell was the usual resource in all subaqueous work, but latterly its use has been nearly altogether superseded by the employment of divers, equipped in Heinke's patent dress. The cost of men working as divers with the diving dress, and in a diving bell, is stated to be as one to three, without taking into consideration that a much greater freedom of action and liberty with respect to space and motion is afforded by the dress compared to being boxed up in a bell. Ever since the commencement of the works for the new Blackfriars Bridge, the operation of diving has been carried on almost hourly, and it has long ceased to be regarded with any greater curiosity than the rest of the working operations. The final weight with which a cylinder or caisson should be loaded depends upon two circumstances, one being the actual load it will have to carry in practice, and the other the rate at which it is sinking. Manifestly the greatest load put upon it in getting it down to its depth should not be less than the load it will have to permanently support, or there would be danger of an after settlement that might seriously jeopardise the stability of the structure. However superior the method of sinking caissons by mere dead weight may be with respect to simplicity and economy, yet there is a limit to its application, and instances continually arise where one of the other methods must be resorted to. These methods are known as the vacuum or Potts's method, and the plenum or that of Hughes's. Both are eminently useful, and we shall, therefore, briefly describe them. The principle of the vacuum method consists, as the name implies, in creating a vacuum in the interior of the cylinder, and by thus removing the pressure upon one side the cylinder descends in obedience to the atmospheric pressure it receives upon its upper surface. Any semi-fluid kind of substratum will be driven up into the cylinder by the surrounding pressure exerted by the air upon it, which is not balanced by any other inside the cylinder. When this plan was first introduced it was restricted almost to sinking hollow piles scarcely exceeding in diameter the ordinary size of timber piles, but shortly afterwards it was found that it was applicable to getting down cylinders of a large size. In fact, the larger the surface exposed to the atmospheric action the better for the practical application of the principle. There is one point to be kept in view with respect to this system which is of some importance. The greatest pressure upon the upper surface of the cylinder or caisson resulting from the exhaustion of the air does not exceed one ton per square foot, so that after it has been sunk to the proper depth, or thereabouts, it must be weighted with a load equal to the greatest it will have to sustain in practice.

This method is admirably adapted for getting caissons down through a soft stratum into one of greater consistency. The most improved plan of employing this method is to connect the cylinder at its upper end with a reservoir, and the vacuum being made by means of pumping, the sand or earth rushes up the cylinder into the reservoir. It is removed, the valve closed, and so the operation continues. Where the substratum is of a clayey character the vacuum process is sure to be successful, but it is useless for rocky bottoms, as the water would be sure to find its way in, and the vacuum could not be maintained. The occurrence of any large irregular masses, such as boulders, in the stratum to be sunk through, would also prevent the vacuum being maintained, and be fatal to the application of the principle.

Of a character the very reverse of the vacuum is the plenum method, which consists in forcing or compressing the air in the cylinder, and thus preventing the water from entering. In order not to lose a whole cylinder full of air every time any earth is removed from the inside in the process of excavation, what are termed air locks are provided, which possess the merit of being applicable to the upper part of any cylinder. This system is well suited for rocky bottoms. Forcing pumps are employed to condense the air sufficiently to drive the water out of the lower part of the cylinder, and the excavation can then be carried on without any unusual difficulty. One peculiar feature of this principle is, that the effect of the condensed air upon the workmen is to increase their energies and physical capacity for labour. At a pressure of about 2½ atmospheres, the men can do nearly twice as much work without fatigue as they could get through in the open air. Both of these atmospheric systems can be, and generally are, aided by the application of weights; as it is by loading that the real test is brought upon the cylinders sunk. We have now given ample information respecting the different principles of sinking foundations, and it will be at once seen that the nature of the locality and the character of the substratum must finally determine that particular method which should be adopted and which would be most likely to prove successful.

WOOD AND IRON.

THE first of a second course of lectures in connection with the Workmen's Technical Education Committee, illustrating the value of science to industry, was given on Tuesday evening, 9th inst., in the theatre of the London Mechanics' Institute, Southampton-buildings, Holborn, by Professor F. Crace Calvert, Ph.D., F.R.S., &c. The subject announced was "Iron and Wood," but the learned lecturer had only time to just incidentally touch upon the latter section of his subject. The attendance was very thin, and the gentleman who occupied the chair spoke with deserved severity of the change that had taken place in the management of mechanics' institutes, the educational element now being almost utterly sacrificed to the recreative one. It was not creditable to the working men that these lectures were so thinly attended. Professor Calvert had voluntarily given his services, coming from Manchester for the purpose, and bringing with him his apparatus and an assistant. Such men as the lecturer could not be expected to be at such a sacrifice of time and money when they witnessed such apathy on the part of the working men.

The lecturer, in his opening remarks, referred to his foreign accent, which was due to the fact that, when a little boy, he was sent to France to acquire the French language. While in that country he got to love science, and especially chemistry, but when he returned to this country he found that there was not a laboratory, not an

institution in the country where a knowledge of technical chemistry could be imparted. This being the case, he returned to the Continent to pursue his studies, which extended over many years, and in course of time he acquired his peculiar foreign accent. Although an Englishman, he had occupied, as a young man, some of the best assistant appointments in Paris, where every man was equal, and it was only a matter of work, talent, and perseverance to attain to the highest position. Referring to the subject of his lecture, he said that iron, owing to certain peculiar properties, was often called "cold-short" or "red-short." "Cold shortness" in iron rendered that metal incapable of being bent at natural temperature without breaking. This was due to the existence in the metal of a few thousandth parts of phosphorus. Science has not yet discovered any process by which phosphorus can be wholly removed from iron. The closest approach to it was published about three weeks since. This was the plan of a French chemist, and consisted in using a substance called fluor spar or fluoride of calcium, which dissolved the phosphates existing in iron ore. But there was a better method than this, if not to remove phosphorus from iron, at least to counteract its evil effects. This consisted in the application of manganese ores, and a notable instance of the value of this process was the improvement and consequent rise in the price of the Cleveland iron. Another substance available for overcoming the evils of phosphorus in iron was spiegeleisen, which was a cast iron very rich in manganese and carbon. Spiegeleisen had enabled Mr. Bessemer to carry on his manufacture of steel with great success. Science had not only discovered the value of spiegeleisen as an adjunct to the iron manufacture, but had produced this spiegeleisen artificially. The artificial product was produced by Messrs. Edington and Son, Phœnix Ironworks, near Glasgow. It was richer in manganese than the genuine article, but did not contain so much carbon. Turning now to "red-shortness," the lecturer said that it was due to the existence of two impurities, sulphur and silicium—the first in the proportion of a few thousandth parts, and the second in the proportion of a few hundredths. The affinity of iron for sulphur was so great that much difficulty was experienced in removing it from iron once it was combined therewith. Therefore it was necessary to remove the sulphur from the materials used in the manufacture of iron before this combination could be effected. There were two processes for removing sulphur, one of which, viz., the employment of quicklime, could be applied in the blast furnace. A second process was discovered by the lecturer some sixteen years ago, which, in its best phase, consisted in adding from 1 to 4 per cent. of common salt to coal, and converting this coal into a coke which could be used with advantage in the blast furnace. The result of melting cast iron in a cupola with such coke was that the iron was purified 20 per cent., and "honeycomb" was completely avoided. One main cause of the presence of silicium in iron was the use of cinders in the blast furnace. This was not economy, as a bad quality of iron was the result. If quicklime and not limestone were used a great portion of the silica would be removed, and the evils attending the presence of silicium in iron would be avoided. After referring to the processes of Messrs. Brown and Bessemer, of Sheffield, for producing puddled steel and improving the quality of the same, the lecturer went on to say that if great progress had not been made of late years in the manufacture of the best class of steel, we were now progressing towards improvement, and in a short period of time we should be enabled to manufacture the best class of steel with the greatest facility. Mr. Biggs and Mr. Mushet have contributed much to improvement in this branch of manufacture. With scarcely an exception, an invention was never perfected or made to pay commercially by the inventor. Successive minds must be brought to bear upon all the little points which, combined, made a complete whole. Referring to the liability of iron to oxidation, the lecturer said that the only commercially successful process for its prevention that we were yet acquainted with was "galvanising," which, however, was a wrong expression, as galvanic action had nothing to do with the process. It was carried out as follows:—The iron was first heated in a furnace until it attained a red heat, in order to remove any greasy matter which might be adhering to the surface. It was then passed into a trough of muriatic acid, which removed the oxide of iron. The iron was next passed through a bath of molten zinc, containing a certain proportion of tin, without which latter ingredient the zinc would not adhere to the iron. The iron was next passed through sand, which rubbed off any excess of zinc which might adhere, and was then left to cool. As the iron passed through the bath there was an alloy of iron and zinc formed, which fell to the bottom of the trough, and from time to time this deposit had to be removed. A few years ago this dross was deemed of little value, and was almost given away. Science has since demonstrated that this dross was of more value than zinc. By the use of this refuse alloy (instead of zinc) in combination with copper a brass could be obtained which had the tenacity of steel and the malleability of iron at a red heat. The galvanising process is a most important and valuable one, on account of the great extent to which iron is being employed in all branches of construction, especially in shipping. The galvanising process would have been of great value had it been applied to the iron used in the construction of the large number of gunboats for the Russian war, which, after being laid up for two or three years at Portsmouth, were found to be falling to decay, owing to the injurious action and reaction of the iron and the tannic and gallic acids existing in the oak upon each other. As a test of the preservative effects of the galvanising of iron, the lecturer had deposited a plate of ordinary iron and a plate of galvanised iron in the sea, allowing them to remain there many months, and weighing them from time to time, and he found that while the former lost 29 30, the latter only lost 1 f 42. Some years ago he examined the various woods employed by the Admiralty, and he had occasion to notice that both "summer-felled" and "winter-felled" oak were supplied to the authorities. If the "summer-felled" wood was used for a paling, or for any other purpose, it would go rotten in a very short time, while the "winter-felled" would last for ten, fifteen, or twenty years. To distinguish one from the other it was only necessary to put them in contact with a proto salt of iron, when the "winter felled" turned black, and the "summer-felled" became of a beautiful dark blue colour.

Iron, under certain circumstances, becomes so soft that it can be cut like plumbago with a knife. Some years since some cannon were recovered from the wreck of the "Royal George," and were found to be in this soft state. The salts in the sea water had acted upon the iron, and had left behind only a framework, principally composed of carbon. From this and similar facts described by the lecturer, he predicted that many of the handsome public piers which have been of late years erected all round the coast in cast iron would probably, in thirty or forty years' time, come tumbling down into the sea. Another curious property of iron was discovered two or three years ago by a French chemist. It is that iron at a red heat is permeable to hydrogen gas, which passes through the metal freely. Large quantities of coal gas doubtless escape in this way from the retorts in the works. Mr. Graham, the Master of the Mint, has made a most extraordinary discovery—a discovery which might lead, bye-and-bye, to some important discoveries in the manufacture of steel. This discovery is that every metal has the power of condensing within its pores an enormous quantity of gas. Platinum, which was so very dense in itself, would condense fifteen times its own bulk of hydrogen, and would retain that gas for two—or, for all we know, two thousand—years, for Mr. Graham had observed that, although a piece of metal had been exposed to every atmospheric influence for two years, still the same volume of gas was given off when the metal was re-heated as if it had not been exposed to such conditions. Palladium would condense 680 times its bulk of hydrogen, gold 40 times, and iron 46 times. If the same piece of iron was brought into contact with oxide of carbon, it would condense 415 times its bulk of hydrogen. This fact showed the peculiar affinity of iron for oxide of carbon. Silver would condense forty times its bulk of oxygen, and only twenty-one times its bulk of hydrogen. Why a metal possesses the property of condensing a larger volume of one gas than of another was not known, but it could not be a mere matter of the relative space between the pores of the metals, as these results plainly showed, for if this was the case the same volumes of different gases would be occluded. In concluding his lecture, Professor Crace Calvert expressed a hope that he had succeeded in impressing all present with the fact that scientific knowledge could be brought to bear with advantage upon all practical matters. He could continue lecturing upon many other subjects in the same way as he had then been lecturing, showing the immense progress which had been made by the union of science and practice. If scientific knowledge were acquired by the men who were constantly engaged in various manufactures and who knew the improvements that would from time to time be necessitated, we knew not what would be the result in the way of developing the resources and securing the prosperity of this country. It therefore behoved everyone engaged in manufacturing processes to acquire knowledge which would be useful to himself and his fellows and beneficial to his country.

INSTITUTION OF SURVEYORS.

THE first preliminary meeting of this institution was held on Monday last, at the Westminster Palace Hotel, Mr. John Clutton in the chair. Among the London surveyors were present, Messrs. T. Horsey, T. Chatfield Clarke, F. and R. Vigers, E. Ryde, R. A. Withall, D. Watney, F. Chinnock, H. Clutton, J. R. Bonny, J. Bailey Denton. Of the country surveyors were C. M. Bidwell, Ely; T. Huskinson, Epperstone, Notts; T. S. Woolley, Newark; T. Statter, Knowsley.

The Chairman, after recapitulating the proceedings already taken in the formation of a provisional association, shortly stated the objects of the institution, which were—1st, to secure the advancement and facilitate the acquisition of that knowledge which constitutes the profession of a surveyor; 2nd, to promote the general interests of the profession and extend its usefulness for the public advantage. He said the proposal to establish this institution had met with very considerable support, and that if all devoted their best energies to the work, they could not fail to raise the status of the profession and ensure its advance in the public estimation. It was then resolved "that the institution be forthwith organised and placed in a position to commence operations."

The following gentlemen were chosen by ballot to be members of the council for the first year:—Messrs. W. J. Beadel, F. J. Clark, E. N. Clifton, J. Clutton, H. Crawter, J. B. Denton, R. C. Driver, R. Hall, H. A. Hunt, T. Huskinson, J. Matthews, J. Oakley, E. Ryde, E. J. Smith, W. Sturge, G. Trist, F. Vigers.

The Honorary Secretary (Mr. J. W. Penfold) read the heads of the bye-laws, which provided that the institution should consist of three classes—viz., members, associates, and honorary members, with a class of students attached. Members to be more than twenty-five years of age, and in practice on their own account for more than five years, or members of a firm established upwards of ten years. Associates to be more than twenty-one years of age, not necessarily surveyors by profession, but their pursuits to be such as to qualify them to concur with surveyors in the advancement of professional knowledge. Honorary members to be persons who by reason either of their position or eminence in science and experience may be enabled to render assistance in promoting the objects of the institution. The various regulations for election of members and officers, the constitution and government of the institution, the conduct of meetings, &c., were fully set out. These bye-laws were adopted, and after a vote of thanks to the chairman and honorary secretary the meeting separated.

An act has just passed the Legislature, and will receive the Royal Assent in the course of a few days, for the purpose of enabling a company, now forming, under very favourable auspices, to erect a large retail market for South London, at Kennington, for the sale of every description of goods, as well as food, on the co-operative system. The site is at the junction of the Brixton and Clapham-roads at St. Mark's Church, Kennington, with frontage to the Brixton-road, Clapham-road, and Church-road; a very central position as regards South London, and one well supplied with omnibus accommodation. It is contemplated to erect the proposed market in the form of an arcade, and so that it shall be a new thoroughfare from the Clapham to the Brixton-road, and contain some 75 shops, to be occupied by the proper proportion of each trade.

THE INSTITUTION OF SURVEYORS.

WE beg to welcome the establishment of another institution in London. This, in fact, is an age of institutions. We have institutions for the promotion of most things, but strange, up to the present time we have not had an Institution of Surveyors. Surveyors are a numerous, and should be, and in most cases are, a respectable body of men. The new institution is founded to secure the advancement of that kind of knowledge which constitutes the profession of a surveyor, to promote its general interests, and to extend its usefulness and general advantage. The medical officers of health of the metropolis have a society which has been the means of communicating knowledge, interchanging the results of experience, and encouraging zeal amongst its members. The metropolis, in fact, is under a deep debt of gratitude to this society. No one, we think, will deny that the surveyor has duties to perform equally onerous, equally responsible, and, if wisely performed, equally beneficial to the public as the medical officer. And if the latter have experienced so much advantage from combination and mutual assistance and encouragement, we see no reason why the surveyors by similar action may not realize similar benefits. The new institution will no doubt do good by drawing a line of demarcation between those who have acquired a practical knowledge of the profession and any broken-down coal-agent or unsuccessful cow-shed keeper who puts "surveyor" on his window-board. We hope and believe that this institution has before it a useful and prosperous future.

CARVED OAK CREDENCE.

THE buffet or locker here given is of Flemish workmanship, date about 1470, and is in the furniture collection of the South Kensington Museum. It furnishes at once an example of beauty and subtle simplicity, an excellent antidote for the wayward fritterings of modern furniture confectionery. The trifling sum of £3 6s. 8d. appears to have been paid for it. The sides are plain linen pattern panels. It is 3ft. 10in. in length, 3ft. in height, and 1ft. 8in. in depth, outside measure. The design is evidently the workman's own. The plucky manner in which the whole thing is done is admirable, art concealing art most effectually, the work having the wholesome appearance of having been done right off, and it does not make any ostentatious exhibition of its constructive detail, a "conceit" those designers knowing less on the subject are fain to display. It is most suggestive in all its parts, yet here are no chamfers, notches, chops, or stops. The framing is plain and square, the scratch moulding simply butting on the rails. The carving is vigorous even to a fault, yet careful withal. Some pains have been taken to express the bone pin in the drapery of the profile head. The *motif* of the carved rail is very good—namely, a wavy, succulent foliage, meandering through a guilloche, characteristic portions of which are given on the plate. The liberty taken with the marginal line over the tree is a license which only a mind above the rule could take. The locks and hinges are little more than can be expressed by their outlines. The credence was doubtless constructed for serviceable ends, and has had a fair amount of wear and tear.

O. W. D.

ARCHITECTS' VISIT TO THE TOWER OF LONDON.

THE "Towers of Julius, London's lasting shame," were visited on Saturday last by a goodly number of the members of the Architectural Association, under the able guardianship of Mr. Thomas Blashill and Mr. Planché. We were invited to accompany them, and accordingly at three o'clock found ourselves at the old gate-house, in the midst of a number of the sturdy "beef-eaters," whose dress, while strangely contrasting with the many modern military uniforms scattered about the place, aided in no small degree to recal the memories of the days when they were the real guardians of the old fortress. We suppose the gallant deputy-lieutenant himself does not often appear to welcome ordinary visitors, or we should be inclined to request his lordship to assume for the occasion the ordinary attire of the days of Henry VIII., and so appear in harmony with his stout retainers. The acting governor of the Tower, although in days gone by a personage little less important than the Lord Mayor of London himself, fails to impress us with the proper amount of reverence when attired in modern coat and trowsers and a white hat. It is but fair to say that the association was treated with the utmost courtesy by all the officials. Lord de Ros himself offered to conduct the members over the building, and only withdrew his offer when informed by Mr Mathews, the secretary, that Mr. Planché, the able archæologist, and Mr. Blashill, a talented member of their own body, had arranged, with his lordship's permission, to show them all worth seeing. These gentlemen, with the president, Mr. R. Phené Spiers, soon arrived, and Mr. Blashill, taking his stand at the south-western angle of the building, in a few well-chosen sentences explained to the members the general plan of the Tower and its surroundings. Proceeding eastward, special attention was first directed to an old gate or postern, one of the oldest portions of the building, and then the famous "Traitors' Gate," underneath St. Thomas's Tower, was visited, and its former and present construction duly explained. The special features of the "Cradle" and Irongate towers were pointed out, and then the members, or as many of them as were able, dived into the basement of the Wakefield Tower, supposed to be of the period of Stephen, and next in age to the White Tower itself. Passing to the interior side of Traitors' Gate, the bridge connecting St. Thomas's Tower with the main building, an entirely modern work, was pointed out. This Mr. Blashill thought was modern in idea as well as construction, it being hardly probable that in early times a permanent bridge would have been built there by which invaders from the river could have so easily obtained access from the outer tower to the King's apartments. Probably all that formerly existed there was a light drawbridge, easily removed in time of danger. Waiting outside the armoury while an ordinary party of visitors, under the guidance of the warders, passed through, Mr. Blashill directed the attention of the company to the exterior features of the White Tower. The whole of this tower was cased over by Sir Christopher Wren, with the exception of the two easternmost windows, which admit light into the chapel, and which have lately been restored to their original condition. Of the four towers surmounting this tower, that at the north-east corner is circular, the other three are square. The portions of the wall in flintwork which have not been cased over are probably of the time of Henry VIII. Mr. Planché then conducted the members through the Armoury, previously addressing them generally on its history and chief points of interest. He observed that the critical knowledge of the science of armoury was in a more imperfect condition than that of any other branch of archæology. Until fifty years ago the most confused and erroneous ideas existed respecting the military habits and accoutrements of the warriors of the mediæval ages. Sir Samuel Meyrick, in his work in 1825, did a great deal to elucidate the subject, and he was employed by the Government to re-arrange what were then known as the Horse and Spanish armouries. He was, however, compelled to compromise with the existing pernicious arrangements, and was ordered to appropriate each suit of armour to some historical personage of the date of its manufacture, and this childish arrangement still exists. He was permitted to affix a star to the inscription banners above the effigies, to distinguish suits which were really known to have belonged to the persons to whom their ownership was ascribed, from the more apocryphal ones; but, of course, this slight distinction, if ever noticed, was not understood by the ordinary visitor. Not only the re-arrangement when completed, but the purchase and disposal of suits and pieces of armour, was committed to the chief storekeeper. Of course the bad results of this were soon manifest. Many worthless forgeries were purchased, pieces of armour were lost or abstracted from the Tower, and many valuable specimens that should only have found a place in the national collection were allowed to pass out of the country or into the hands of more enlightened private collectors. In 1858, he (Mr. Planché) was requested by Lord Herbert of Lea to examine into and report upon the condition of the collection. In that report he pointed out that no educated antiquarian was at the head of the armoury, and that this was the more inexcusable as the exhibition was entirely self-supporting, a revenue of some thousands of pounds being derived annually from the fees paid by visitors for admission. But for the death of that amiable and accomplished nobleman, some steps would doubtless have been taken to remedy the existing state of affairs. Lord de Ros, who had been listening to Mr. Planché with marked attention, here interposed, and said that, although the existing state of things was not one to be proud of, it was not quite so bad as Mr. Planché had inferred. The armoury had not been entirely entrusted to the chief storekeeper. The Government had derived great assistance from Mr. Hewett, and Mr. Planché himself had done a very great deal for the armoury. Mr. Planché said he did not wish to detract from the merits of Mr. Hewett, he acknowledged that he had done a great deal, but much more remained to be effected before the collection could be said to be complete. The most interesting of the specimens were pointed out in detail, and the members then proceeded to the chapel in the White Tower. Passing from thence through the banqueting room, now filled with Snider rifles, they reached the Council Chamber, in which room, as Mr. Blashill reminded the members, on the 13th of June, 1468—exactly 400 years ago—Richard III. ordered the execution of Lord Hastings. The "Little Ease" dungeon, below, having been explored, the Jewel apartments were visited, the description of the "Queen's crown, the sceptres, the orb," &c, being duly intoned by the lady in waiting. The members were then told off into small parties to visit the remaining places of interest under the guidance of the warders, and so a most pleasant afternoon's excursion was brought to a close.

MANCHESTER NEW TOWNHALL.

WE give this week Mr. E. Salomon's design for the new Manchester Townhall. Having on a preceding occasion given our opinion on the merits of this design, it is unnecessary for us to repeat it now.

PARIS EXHIBITION, 1867.

THE Lords of the Committee of Council on Education, considering it desirable to hold out encouragement to masters and mistresses teaching in Schools of Art, to visit the International Exhibition in Paris last year, with the view of studying those objects which might be made instrumental in benefiting the instruction given in art schools, offered to every such teacher visiting the Paris Exhibition the sum of £5 in aid of his or her expenses, and an additional sum of £2 for any one report which any such teacher might make, or any useful suggestions in respect to his or her duties or teaching derived from the study of the Exhibition, such report having first been published in any journal, local or otherwise, and approved of by their lordships. For each of the three best reports the following prizes also were offered:—For the best report, £20; for the second best report, £15; and for the third best report, £10. The International Exhibition was visited by 101 art teachers, of whom 28 made reports approved by their lordships. The first prize has been awarded to Mr. W. J. Muckley, head master of the Manchester School of Art, the second to Mr. Walter Smith, head master of the Leeds School of Art, and the third to Mr. Dewar Campbell, master of the Bridport and Dorchester Schools of Art.

A public meeting was held at Brixton on Tuesday evening last, to protest against the erection of a smallpox hospital in that thickly populated neighbourhood. Such hospitals must be built somewhere, and the least thing the sapient speakers at the meeting could have done was to have suggested another site.

Design for Manchester New Town Hall.—E. SALOMONS, ARCHT.

CONSTRUCTIVE AND ÆSTHETIC DESIGN.—XVI.

THE details of a structure no less than the general treatment of its masses should be designed, not merely drawn. It is not too much to assert that the process is reversed in the majority of our architectural works. Drawing precedes design instead of simply becoming the means of its expression, and the expert draughtsman often finds himself, perhaps unknowingly, only embodying the idle and floating fancies of his imagination rather than thoughtfully working out the substantial realities of a building, each by itself being more or less a problem. As members of an organic whole and depending upon plan and elevation for their scope and general tenour, the fitness of every detail should be apparent instead of subserving some idle dream or whim. It is difficult, I admit, sometimes to trace any basis, principle, or type for our bit of moulding, tracery, or carving that shall become, in spite of ourselves, the foundation of it, and the architectural designer is thus drifted into a realm of imagina-

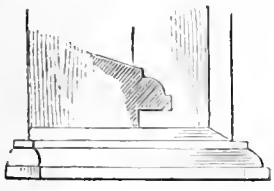

FIG. 1.

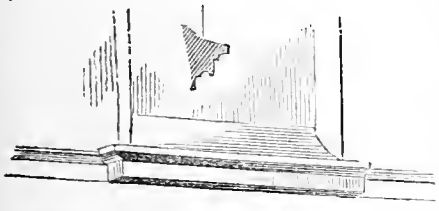

tion in which he can quickly transform a fact into a fiction, making that which should have been worked out of certain conditions a creature of fancy. In one word, the detail is drawn in, and it is only after the work is carried out that its fitness becomes evident or otherwise. Ascending from the strictly utile to the sculpturesque or æsthetic, this difficulty is increased proportionately as the connection between the useful and ornamental is lessened or becomes less apparent. In architecture alone the conflict of what it should be? and how it should appear? is carried to an excess that frequently defies the nicest discrimination. A chimneystack emerges where we least desire it, a window opening or a blank appears just in the place its opposite would have looked best, and it requires no little adjustment of *pros* and *cons* for that equitable balance of effect needed to produce harmony. But the great obstructive to progress in these matters is the copyism that prevails, the spirit that, in spite of progress, lingers behind. A precedent is all that is required, and judgment is set aside for it. No matter how devoid of common

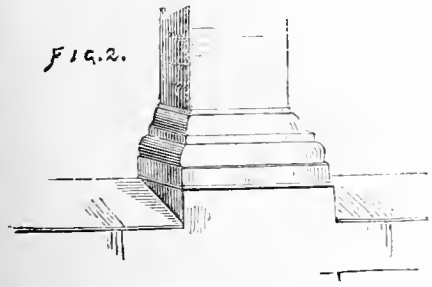

FIG. 2.

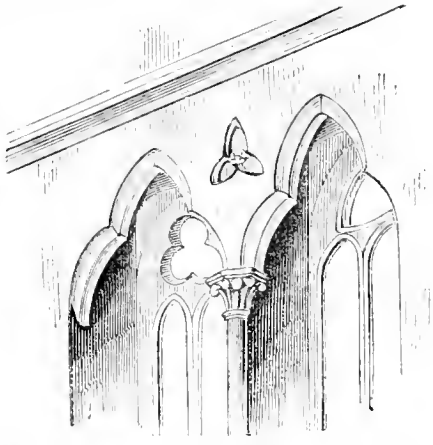
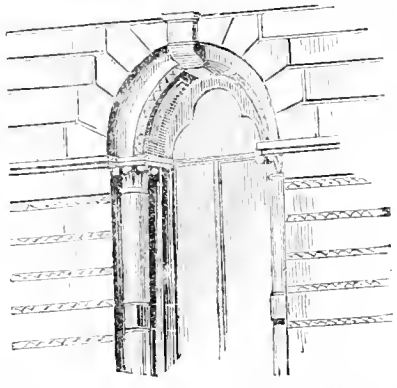
sense, useless, or extravagant, a thing is perpetrated that arose out of very different conditions, or that grew out of necessity. And the danger of this mode of study is obvious: the great principles, the very basis of our work, are forgotten or made subordinate to the decorative and minor details. Hence we see many standing high in the profession copying inferior examples for the sake of detail only; others sacrifice coherency for freshness or piquancy of effect. The first class give us modern churches with all the worn-out paraphernalia of the Mediæval cathedral, or be-

FIG. 3.

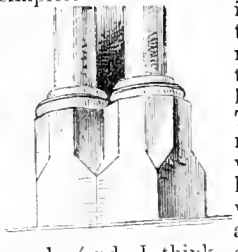
decked in all the Gothic finery of a mock Gothic era; the latter, the crude fancies of their own or the imperfect examples of an imperfect age. It is no less absurd than regretful to see the feudal fortress, with all its barbaric accessories, reproduced for national courts of justice, and the rude conceptions and chiselings of a benighted age copied in a nineteenth century church. We may conventionalise or "architecturalise" without



caricaturing, and it is nothing else but doing this when we copy contorted features and the bad drawing of Mediæval glass. Till we find architects discarding the superfluous accessories of Mediævalism and all the profuse

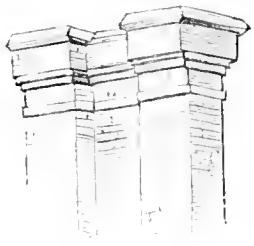


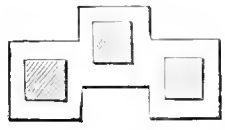
ornamentation that come parasitically of a stagnant art and thoughtless design, there remains much to be taught and done. The simplest feature or detail is often the best, as



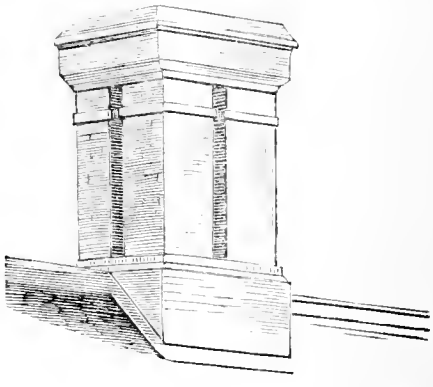
it is the cheapest—a truth our costliest and most elaborate structures have repeatedly forced upon us. The Palace of Westminster itself—about which there has been lately such a waste of words as to its art-authorship—is an example (and, I think, an unfortunate one) of a lavish display of architectural millinery—a mere network of panelled tracery, about which there can be little to take credit for, save the mechanical skill and patience that covered *ad nauseam* a well-massed exterior with it. The value of a building architecturally is in proportion to the amount of original thought and skill expended upon it, and not according to its display of surface or running ornament. Let, then, the stamp of thought or design be upon every detail, however insignificant in itself.

Our sketches show a few details taken at random. Fig. 1 shows an improvement on ordinary window sills. It is singular that the old square form should so persistently hold its place, even in good-class buildings. I think we rarely show sufficient weathering;





a good hollowed curve is a relief. Probably the idea of holding flowers has hindered improvement, but for this object why not boldly project a moulded and bracketed slab? The manner now frequently seen of finishing



pilaster projections, letting them die away flush into the plinth, is an excellent one and deserves attention (fig. 2). We often notice plinth mouldings mitred back at a doorway. I think a preferable plan is to return it downwards to the ground, as in fig. 3. The other sketches explain themselves. The chimney heads shown are suggestive of a simple and better treatment of these important appendages than generally seen, and in our next paper we will say a few words upon them.

G. H. G.

POST MORTEM HOUSES.

IN the last monthly report on the Health of the Parish of Marylebone, Doctor Whitmore, the indefatigable medical officer, says that "sanitary work during the month has progressed satisfactorily. An additional duty which I have recently imposed upon the inspectors of nuisances, and from which I am led to hope for beneficial results, is the disinfecting of houses in which sickness from smallpox, measles, fever, and scarlatina is known to exist. Hitherto the disinfecting—so called—has been done by the inmates of the house by orders from the Board, but I need hardly say that in such hands the process was utterly inoperative and useless; by appropriate chemical agents, not only are the drains, closets, dustbins, &c., disinfected, but the atmosphere of the house also, and I look forward to the time when, by the bounty of the vestry, I may be provided with the proper apparatus for thoroughly disinfecting clothes and bedding. I am also awaiting anxiously the completion of the good works which were determined upon by the vestry last year—viz., the erection of the Mortuary House and the Post Mortem House; the former is greatly needed. It is misery enough for a poor

man with a wife and five or six young children that he can only afford to rent one wretched apartment, in which all the family are compelled to live and sleep, and where the cooking, washing, and the whole daily routine of domestic duties are performed; but what must be the additional wretchedness and sorrow when one of the family dies, and when, for the period of a week at least, no other place can be found in which the lifeless and rapidly decaying body can be deposited; and yet this is a matter of daily occurrence; every feeling of humanity and reverence for the dead revolts at it, and everyone who has an interest in the health, safety, and well-being of the living will be anxious to provide a remedy."

DWELLINGS OF THE INDUSTRIOUS CLASSES.

THE directors of the Metropolitan Association for Improving the Dwellings of the Industrious Classes have issued a satisfactory report in anticipation of the annual meeting to be held on the 19th inst. It appears that since the last report ten pairs of cottages have been built at Perge, and are now occupied, and 20 more are on the point of completion. The profit during the year has been sufficient to pay a dividend of nearly 5 per cent. on the paid-up capital; but as certain contingencies have to be provided for, the directors recommend the payment of a dividend of only 4 per cent., which will leave a balance of £829 1s. 6d to be carried over to the guarantee fund. One of the most satisfactory features in the report, however, is the account given of the sanitary condition of these dwellings. The average rate of mortality in the buildings of the association has not been 14 per 1,000, while that of the metropolis generally has been 23 per 1,000. The mortality has decreased during the present year 3 per 1,000 upon the very low rate of 17, which was the average of the seven previous years.

HOFFMAN'S PATENT BRICKKILN.

A SHORT time since the local board of health of Swansea appointed Mr. R. Rawlinson, C.E., and Mr. Edward Cousins, the borough engineer, to inquire into the subject of brick smoke, which caused considerable inconvenience in the neighbourhood. The following is the substance of the report made by these gentlemen:—It refers principally to Hoffman's patent kiln, which is built in the form of a large arched passage of a circular form on plan, within which the burning of the bricks is carried on round its circumference. There are twenty-four entrance doorways, admitting of being closed with temporarily-built bricks and clay, so as to retain heat and exclude all entrance of air by the doorways so built up; the circular chamber consisting of twenty-four compartments, or spaces, with one of these doorways to each. In the centre of the ring a chimney is erected about 150ft. in height, measuring at the base about 16ft. square, and from each of the twenty-four compartments of the annular chamber an underground flue leads into the chimney; each flue has a valve by which its communication with the chimney can be cut off; arrangements are made by which a damper, or portcullis, can be inserted, so as to cut off all communication between any of the twenty-four compartments of the ring kiln and the next ones.

After the kiln has been lighted the fire is never extinguished, but the burning of new bricks and the removal of the finished produce are carried on by a continuous and regular process from day to day. Two of the compartments on each side of the kiln have their entrance-doors open, all the rest being closed. By an arrangement of valves (or dampers) in the branch flues, and the larger damper or portcullis in the main flues, air is admitted by the open doors, and has to go round the whole circuit of the kiln in order to reach the chimney. From one of the two open compartments on each side of the kiln men are taking out finished bricks, and in the other they are building unburnt bricks which are not yet quite dry.

Air entering by these compartments passes first among bricks almost cold, and then goes forward to warmer bricks, and so on to hotter and hotter, carrying the heat of the cooling bricks forward with it until it reaches half-way round one-half of the kiln, at which place there is a final accession of heat from the burning of a very small quantity of coal-dust, which is from time to time dropped in through properly-arranged flues from the top of the kiln among the bricks by numerous small openings, furnished with movable heads. The hot air, including the products of combustion, then passes forward to the bricks, which, by its continuous current, are being dried and heated, passing on among them from hot bricks to those that are less and less so, heating them as it goes on to those which are still damp, drying them, and then passing to the chimney with moisture in the form of steam or vapour taken from the damp bricks. Each day a portcullis is shifted forward one compartment, and a corresponding change is made as to the flue which is to communicate with the chimney and the air at the end of its circuit in the annular chamber. The places where coal-dust is thrown in are also advanced one compartment, and so the whole process goes on.

In the burning of this kiln there is an absence of all smoke containing sooty particles, arising from the perfect combustion of the fuel. That which is discharged from the chimney is steam or vapour from the drying bricks, mixed with gases from burning the clay. These gases are discharged into the air at about 150ft. Since the erection of these kilns no complaints have been made by the inhabitants of the neighbourhood.

Conclusions:—An examination of Messrs. Hoffman's patent brick-kilns has convinced us that bricks may be moulded, dried, and burned all the year round, and with great economy, as also without sending into the atmosphere black smoke. The patented process economises heat to a very great extent, and thereby saves fuel. The mode of feeding the kilns ensures a combustion of the carbon of the coal; and as very much less coal is required than in the rude method of open kiln firing, local nuisance is in a corresponding degree lessened, and the gases and vapours produced are delivered into the surrounding atmosphere at the elevation of any chimney provided for such purpose. At West Brompton, where Messrs. Hoffman's kilns are situated, this elevation is about 150ft.

EXPLORATIONS IN PALESTINE.

THIS is an age of restoration. Destructive as it seems to be, its purpose is to dig down to the old foundations, and discover what actually was or is beneath what seems to be. From the old Norman or Saxon churches, where the whitewash is scraped from the rudely pictured walls and the plaster is picked from the sculptured doorway, to the mounds of Babylon and Nineveh, where a heap of shapeless rubbish is made to tell us stories of forgotten history, everywhere there is an effort after better acquaintance with the past. Everywhere the ancient world lies under a heap of rubbish. Eighteenth century churchwardens whitewashed oak ceilings and plastered groined roofs, and shut up sculptured windows and doorways in the interests of economy, so that many of the ecclesiastical restorations of the age are merely the uncoverings of the past. Time has done the same with sites and places. In our towns and cities the Middle Ages are under our feet. We come on traces of old London in digging for sewers and excavating foundations. In Leicester a Roman pavement is shown in a cellar, which was once on the doorstep of the ancient house in the same old street, but the level of the street has risen above it, as all our levels seem to do. It is not the natural soil, but the rubbish of ages, on which we of the nineteenth century walk. Still worse is the rubbish of legend and story which encumbers historic sites. The ancient world lies buried under a mass of conjecture and assumption deeper than Thebes or Babylon beneath the dust of the desert. We may say, without reference to the ancient figure of speech, that historic truth lies in a well, and we must dig deep to get it. But of all ancient places to which this applies, it applies to Palestine the most. Over the sites and scenes of Sacred History so many changes have passed, so many wars have been waged, so many revolutions have swept, that they lie buried under the rubbish of ruin and legend of actual displacements and misleading guesses deeper than ordinary observation can trace them. The destructions of Pagan Rome were followed in after ages by the reconstructions of Christian Rome. Paganism obliterated the traces of Christian scenes, but Christianity sought them and found them anew. The devout feeling of earlier times sought the spots where interesting events had happened, and ready imposture or greedy faith discovered them all. Palestine is the land of falsehoods. Every scene of the Bible History has had its setting found for it, not by investigation and inquiry, but by crude guessing, by unscrupulous assertion, or by omnivorous faith. We have more to unlearn than even to learn in Palestine. Monkish lore has overlaid the land, and buried its historic sites deeper than the rubbish of its ruins. We have to cart away the one and dig through the other. We have to apply the patient habits and scientific methods of modern study and observation to the investigation of these ancient cities and landscapes and this historic soil, with the hope that some substantial addition will thereby be made to our knowledge of the past and to the literary criticism of ancient history.

This is the object of the Palestine Exploration Fund, and of the excavations which have been carried on under its direction. It was an American divine, Dr. Edward Robinson, who, in our own day, gave the first distinct impulse to Palestinian discovery. He found traces of ancient sites embedded in the speech of the common people, and was able to identify many of the scenes of Jewish history by the names by which they are still called by the Arab wanderers. In 1840, Majors Robe, Scott, and Wilbraham, with a corps of engineers, made a partial survey of the country, and Lieutenant Symonds executed a trigonometrical survey of great part of Judæa and the plain of Esdraelon, and ascertained the remarkable difference of level between the Dead Sea and the Lake of Tiberias on one hand and the Mediterranean on the other. Since then many travellers have continued their researches with various incomplete results, from the Rev. Henry Tristram's investigations into the flora and fauna of the Lebanon to M. de Saulcy's crude guesses and hasty inferences about the Dead Sea, and his more satisfactory journey during the present decade. But it is still true, as the Archbishop of York said at the meeting on Thursday, that it is a shame and a reproach to Christendom, that the land of the Bible should be so little known as to its geography, its natural history, its archæology, and all that science and literature can most desire to know as to the cradle of our civilization and our faith.

The work already done by the society is only enough to show what promise there is of rich results in the future. The actual explorations have been confined to the capital, and a few data have been procured for determining several of the sites of ancient buildings. The streets of the ancient city have been reached, drains, passages, and reservoirs laid bare, and some of the features of the original Temple-hill have been discovered. In the Valley of Kedron the well of Job was sounded to the depth of a hundred feet, and a broad causeway was found between Zion and Moriah, built arch on arch like some ancient Roman viaducts still existing in the Campagna. But the chief discovery was one single work of ancient art—the seal of "Haggai, the son of Shebaniah," supposed to be as early as the time of Ezra, and with an inscription in the ancient Samaritan character. This, with a few coins and fragments of pottery, is all that the excavations have yielded as yet. In the valleys of Kedron and the Tyropœan a succession of shafts had shown how far beneath the present surface lay the ancient level, and how the description of Josephus might have been literally true, and the view from the battlements of the ancient city before its ruins had choked the valley may have been the giddy height the historian so proudly tells of. But the little which has been done is only the promise of more, and if the excavations proceed it may come to be with Jerusalem as with Rome and Pompeii, that travellers will go, as Dr. Stanley says they are already beginning to do, to vivify their interest in history, and increase their intelligent understanding of it by looking at the scenes amid which it was enacted, and tracing out the spots which great events have rendered memorable. This is the practical use of such explorations. To vivify an ancient narrative, to light it up with something of the brilliancy of contemporary chronicles, we must reconstruct the scenes amid which it lies. It is this which gives such sharp reality to some events of our own remoter history, and helps us to feel as we do the continuity of our national life. It is this, too, which in addition to a clear and brilliant style is the charm of Renan's Life of Jesus. Written among the scenes in which the life was lived, there is something in it of the natural setting in which it was placed, something of the background before which its august subject moved, however unnatural and monstrous may be the figure Renan has put in His place. The popular interest in

Palestine arises from the fact that pictorial teaching is more vivid and lifelike than any description can be. The critical interest in it arises from the better understanding of any narrative which is given us by knowing something of the scenes among which the persons it speaks of moved, and the events it tells of happened. Some disappointment will therefore be felt at the small results which Palestinian exploration has as yet produced. But those results are at least the promises of greater. They have laid the foundations for the archæology of Jerusalem, and they already promise to correct the false impressions of tradition, and to restore the true position of places which association has consecrated. Already monkish geography, which is nearly all we still have of Palestine, has got additional discredit thrown upon it, and, as Dean Stanley said on Thursday, "the reputation of our old friend Josephus has been considerably rehabilitated." Perhaps the completion of the survey may completely vindicate the old historian's credit and restore his fame.

The interest which has been already awakened in these explorations ought to guarantee their continuance. This is a work which peculiarly needs time and patience. In such investigations success is often the sudden reward of long continued labour. In Lieutenant Warren the society has an able and enthusiastic agent, emulous of the fame of earlier explorers, and entirely equal to his task. We are glad to hear that he starts for Palestine to-day to continue his researches. There can be but little doubt that the £300 a month needful to carry on the work will be supplied by English liberality. Literature and science are both interested in Lieutenant Warren's proceedings, and even religion may be benefited in the more vivid interest which greater knowledge of its historic scenes may throw over its narratives, and the more life-like reality which may be given to poem, and prophecy, and parable. To give a local habitation and a name to places known to all our children from the Bible narrative, is, as Sir Henry Rawlinson said, one of the purposes of Palestinian Exploration, in which it comes, most closely home to the interest of every English man, woman, and child. —*Daily News*.

MR. LAYARD AND ASSYRIAN DISCOVERIES.

AS we before announced Mr. Layard was presented with the gold medal of the Institute of British Architects for the present year. Mr. Tite, the president, was in the chair, and concluded a complimentary speech in these words: "I have, sir, the greatest possible pleasure, by the gracious permission and command of Her Majesty, in presenting to you the highest distinction we can possibly confer—the gold medal of the Royal Institute of British Architects."

After some introductory remarks Mr. Layard said: The only claim I could have to this honour —and that claim is indeed but a small one—is that I have succeeded in the partial recovery of an ancient and important branch of architecture, from which many of our most beautiful forms have been derived, and to which some of the noblest conceptions of classic, mediæval, and modern times may trace their origin. I did my best conscientiously as an amateur without professional training (I may almost say without that elementary knowledge which was absolutely necessary to such an undertaking), in describing and illustrating, to the utmost of my ability, the discoveries which I had been fortunate enough to make. If I may venture to trace the considerations which have induced the Institute of British Architects to confer this honour upon me, I might attribute them to a certain extent to that desire, which is especially characteristic of our age, to go to the origin of things, and to submit every branch of art, as well as of science, to the minutest analytical investigation. If I be correct in this view, the discoveries during the excavations at Nineveh of the remains of Assyrian architecture, may be of some importance in affording data for such investigations, because in them we find the original types—or, if not the original, the most ancient types with which we are acquainted—of some of the most beautiful details and ornaments of the most elegant and refined order produced by the Greeks, namely, the Ionic. It is highly interesting to trace this human progress. Every day's experience and all modern discoveries tend to show that no art nor science came to man at once as a new creation or revelation, but that all things have been brought to the state of perfection which they may have attained by a gradual process of development and by patient and intelligent labour. These discoveries probably owe their interest chiefly to the fact that they show us one of the phases of this process of the human mind, and afford us valuable and instructive insight into the history of man, of his civilization, and of the development of his intellectual faculties. But, sir, in considering the nature of these discoveries, I would not wish to attribute to them too much importance. I am afraid that you may have done so, but this I may venture to say (and I do say it with an earnest belief that it is true), that whatever may be the result of my labours I devoted myself to them conscientiously and assiduously. From my earliest youth I felt a deep interest in and a love for art, and it was my wish to be as useful as possible in promoting its knowledge and influence. As regards my connection with the profession (of which I may consider myself almost a member, as I have long been an honorary member of the Institute, and am now one of your medallists), I look upon that connection with very great pride, for I believe that in no other part of the world does that profession contain a larger number of highly-educated, able, conscientious, and honourable men than in this country. I do not think that architecture is sufficiently appreciated or understood in England; I do not think that the English public have yet realised the fact that it is the noblest of the arts, and bears upon it most vividly and eminently the impress of the civilisation, greatness, and culture of a country. In the very best times of the ancient world (and, indeed, of the modern world) in ancient Greece and Rome and in Italy, architecture did hold its proper position. It was then recognised that all the other arts were subordinate to it, and that it was in completing and perfecting the work of the architect that the genius of the sculptor and painter was brought into play, and received its greatest impulse. I believe that until that fundamental principle is recognised in this country, architecture will not assume its proper position. If I can do anything in the direction of endeavouring, to the best of my humble ability, to inculcate this truth, and in making these principles better known, I shall feel that I may have some more valid claim than I now have to the high honour you have conferred upon me. Allow me, sir, to thank you personally for the kind and flattering manner in which you have alluded to me, and have expressed the feelings of the Institute with regard to my services to art. I may perhaps venture to correct one statement which you have made, not, I hope, from any feeling of vanity on my part, but for the sake of truth. You let fall an expression which is not strictly accurate: you said that I was aided and assisted in my labours by a distinguished Frenchman. That was not the case. I received no assistance or aid from M. Botta, the gentleman to whom you no doubt allude. So far from such being the case he and I were not at Nineveh together engaged in excavations. I preceded him in visiting the ruins, and his discoveries were independent of my own. In 1842 I was for the second time at Mosul, when M. Botta was sent there as French consul, and it was partly owing to the information and encouragement which he received from me that he was induced to open the mound of Kouyunjik, and afterwards that of Khorsabad, which led to those important discoveries which he has so well described and illustrated in his magnificent work. I do not say this to detract from the merits of M. Botta; on the contrary, I have always said that to him is to be attributed the merit of the first Assyrian discovery; and no man is more worthy of the distinction and of the honour which he may derive from it, both on account of the readiness which he showed in giving every information to me, his fellow labourer, and the modesty with which he described his own discoveries. I have been accused of Philo-Turkish proclivities, but you will perhaps not think the worse of me if I venture to bear my testimony, on an occasion like this, to the kindness and generosity displayed by the late Sultan, the Turkish Government, and the natives, with regard to my researches in Assyria. Considering the anti-Turkish feelings which prevail among a large number of persons in this country, and which are sometimes carried, I fear, to a great length, it is right that this tribute to a much abused people should be borne by me. In no other part of the world could I have received such disinterested assistance, and have been allowed to pursue such labours and researches without interruption or molestation.

ARCHÆOLOGY.

FRIDAY last there was discovered on the farm of Arniebog, in the parish of Cumbernauld, on the line of the old Roman Wall of Antoninus, which runs across that farm, a large stone, on which was sculptured in *alto relievo*, within a square moulding, a naked figure bending on one knee in a suppliant attitude, with the hands tied behind the back. The figure is about 10in. in height from the lower moulding, upon which the knee rests, and from the foot to the other knee of the figure about 3½in. The stone is a hard, coarse-grained freestone, and is evidently a portion of an altar erected to commemorate some conflict or skirmish between the Roman soldiers employed on the wall and some of the Caledonian tribes.

During some recent excavations on the sites of Heliopolis and Memphis, a curious pavement was discovered at the depth of 7ft. But on digging 7½ft. lower still a much more ancient piece of paving was discovered, composed of the fragments of some old building, inscribed with the names and honorific titles of the Disc-worshippers. The features of the Disc-worshippers are characteristic, but very little seems to be known about them. It was apparently the policy of a later dynasty to destroy all traces of them.

An interesting archæological discovery has been made in a railway cutting at Pont de Pierre, not far from Châlons sur-Saône. At 3ft. below the surface of the ground a group of thirteen skeletons was found in a narrow space, and wonderfully preserved. They seem to be the bones of full-grown men who had died in battle. The skeleton of a woman has been discovered among the others. Between the jaws of one of the dead was found an obolus, which the friend of the defunct had no doubt slipped in to enable the departed to pay his fare to Charon. A coin, very much defaced, but still seen to bear the effigy of the Emperor Gordian, was also picked up among these remains, which leads to the conclusion that 1,700 years have elapsed since they were there interred.

PARLIAMENTARY NOTES.

ON Monday night Mr. Waldegrave-Leslie asked the First Commissioner of the Board of Works whether the statement that Mr. E. M. Barry, A.R.A., had protested against the appointment of Mr. Street, as architect of the new Law Courts, on the ground that such appointment was at variance with the letter and spirit of the conditions of the competition entered into by the architects, was correct. Mr. Sclater-Booth (in the absence of Lord J. Manners) said that such a protest was received from Mr. Barry after the appointment of Mr. Street. The designs having already been exhibited during six months in Lincoln's Inn, and it not being probable that any one of them would be carried out, he did not see what advantage could arise from compliance with the suggestion that they should be again exhibited in the library of the House.

On Thursday week Mr. Goldsmid asked the First Commissioner of Works whether it was true that Mr. Street had been appointed architect of the Law Courts, and Mr. Edward Barry of the National Gallery; and if so, whether those gentlemen had been informed of their appointment; and whether it was proposed by her Majesty's Government to ask the House for votes on account towards the erection of those buildings. Mr. Sclater-Booth (answering for Lord J. Manners) said it was true that Mr. Street had been appointed, and had received official notice of his appointment. Mr. Barry had received a printed notice of his appointment, but the official notification had not yet reached him. A vote had been taken this session to acquire the site of the National Gallery, and no further vote would be taken this year. A vote had also been taken on account of the site of the Courts of Justice, but it was possible that a further small sum might be required to clear the latter site. The correspondence moved for by the hon. member for Whitehaven would be laid upon the table of the House when ready.

WATER SUPPLY AND SANITARY MATTERS.

DR. ROBINSON, the medical officer of Leeds, has just issued a report on the sanitary condition of that town. The death rate last year in Leeds

was 26·9 per 1,000, compared with 30·9 during 1865, and 32·3 during 1866. In Leeds, as in Liverpool, the health committee have taken the scavenging work into their own hands, and from April 13, 1867, to the end of last year 14,991 ashpits were emptied, containing 45,307 tons of manure and rubbish, at a cost of £7485. The sales of manure, however, amounted to £4,183. Dr. Robinson is in favour of the water-closet principle. He says—"With water as a carrier, and sewers as a *via*, available means for cleanly and expeditious removal are always at hand, **and, therefore,** with such palpable advantages to be derived by selecting water carriage as a conveying medium, it is worthy of consideration whether the chief objection to its use in a sanitary point of view—viz, increased pollution of sewers, and consequent generation of deleterious gases in large quantities—cannot be obviated by proper gradients, efficient trapping, flushing, and ventilation, supplemented by the copious use of deodorisers and antiseptics. It is impossible to form rightly an opinion on the merits of the water carriage system apart from such considerations, for the efficient working of any method materially depends for its success on the completion of the mechanism employed, which has not only to be so contrived as to fulfil the original design, but also so arranged as to meet the varied conditions and difficulties which bad habits and ignorance create."

The Pollution of Rivers Commission paid their first visit to Manchester yesterday, and proceeded to the townhall, where they were introduced to the corporate authorities, and the newly appointed officer of health. The present object of the commission is a preliminary inspection of the basins of the Mersey and the Ribble. All the rivers in this neighbourhood, including the Irk, Irwell, Medlock, Etherow, and others, are tributaries of the Mersey, and carrying an immense amount of filth into that river will furnish ample material for inquiry.

Mr. Orton, the medical officer for Limehouse, in his last report, said he had received several complaints of the state of the River Lea, which he attributed to the condition of the weather, as no real improvement could be looked for while the river received the sewage of Westham.

Building Intelligence.

CHURCHES AND CHAPELS.

Bampton Church, Oxfordshire, is in course of restoration under the direction of Mr. E. Christian, of Whitehall. The chancel is nearly finished, and the transepts are now in the hands of the builders.

A new Wesleyan Chapel is about to be erected at Fenton, in the Pottery district. It will be built of red bricks, with blue bands and plinth. Sittings will be provided for 450 persons. Mr. E. Penn, of Stoke-on-Trent, is the architect, and Mr. A. Barlow, of the same place, the contractor.

The foundation stone of a new Congregational Chapel was laid on Wednesday week at Hexham. The style is Early English, and the building will seat 375 persons, at a cost, including the site, of £3,500. Mr. Johnstone, of Newcastle, is the architect.

The Ridgway Memorial Chapel was opened at Hanley last week. Messrs. Scrivener and Son, of Hanley, are the architects, and Mr. C. Woveridge the contractor.

The foundation stone of a new Wesleyan Chapel was laid at Alsager, Staffordshire, on Tuesday week. The style is Gothic. The materials to be used are red pressed bricks, relieved by bands and voussoirs of black and white bricks and stone dressings. The contract for the erection of the buildings has been taken by Mr. John Stringer, of Sandbach, and the entire cost, including land and all other charges, is expected to amount to upwards of £2,200. Mr. G. B. Ford, of Burslem, is the architect.

On Whitsun-Tuesday the rite of consecrating the new chancel recently added to the parish church of Herne Bay, was performed by the Bishop of Gloucester and Bristol. The style of the new east end added is the Gothic of Northern Italy. Messrs. George and Vaughan were the architects.

The foundation stone of a new church for the Capuchin Friars was laid at Dublin on Friday last by Cardinal Cullen. The style is fourteenth century Gothic, and the plan comprises a nave 130ft. long by 45ft. wide. Mr. J. J. M'Carthy is the architect.

On the 2nd inst. the new district church of Limbury-cum-Biscot, near Luton, Beds, was consecrated by the Lord Bishop of Ely. The church, which has been built at the sole cost of John S. Crawley, Esq., consists of a nave 58ft. by 26ft., a chancel, 35ft. by 20ft., a north chancel aisle, 16ft. by 10ft., divided from the chancel by a double arch, supported on a polished marble pillar, an organ chamber, a sacristy, a north porch, a double bellcote, and a warming crypt. The style is Decorated. The walls, which are 3ft. and 4ft. thick, are faced inside and out with light coloured bricks, relieved with others of a deeper tone, and cored with chalk. All the dressed work is out of freestone. The roofs are open framed, of pitch pine, covered with heavy green slates, and are felted and boarded. The benches are also of pitch pine. The aisles are laid with encaustic tiles, and the chancel wall below the window is faced with similar tiles, supplied by Mr. Godwin, of Hereford. The pulpit and font are carved, the former diapered. An oak screen separates the chancel from the nave, and the chancel is fitted with stone sedilia, piscina, and credence. The church was built by Mr. Gough, builder, of Bishop's Castle, from the designs and under the superintendence of T. Nicholson, F.I.B.A., of Hereford, the diocesan architect.

On Saturday last the foundation stone of a new Presbyterian Chapel was laid at Rochdale. The style is Early Decorated, and the building will seat over 800 persons, at a cost of about £6,000.

On Friday last St. Mary's Church, Notts, was reopened after restoration. The whole of the stonework and tracery of the exterior of the building has been repaired; the gallery at the west end has been cleared away. New benches have been placed in the nave and aisles, new floors laid, the windows glazed, new roofs constructed, &c. The work has been carried out under the joint direction of Mr. H. Currey, of London, and Mr. S. D. Walker, of Nottingham.

A wealthy Jew is about to build a new synagogue at Chatham, as a memorial to his late son. The building, the contract for which has been taken by Mr. J. G. Naylor, of Chatham, is to cost nearly £5,000, and will, it is said, be a very imposing structure.

On Thursday week the foundation stone of a new Wesleyan Chapel was laid at Whitstable. The building, which is of a very plain description, will accommodate 800 persons, at a cost of about £1,600. Mr. Foad, of Whitstable, is the contractor.

St. Andrew's Church, Stockwell-green, was consecrated on Thursday morning, with the usual ceremonies, followed by a sermon, a collection, and a dejeuner.

On Wednesday week the church of the Holy Trinity at Hawley, Hants, was reconsecrated, a new chancel having been added in place of the former small apse. The cost of the works was £2,500. Mr. C. Buckeridge, of Oxford, was the architect.

Middleton parish church is at present undergoing restoration. The removal of the organ and the western gallery has laid open the tower arch, which has been blocked up some three-quarters of a century. It now exhibits many points of interest, showing that the present church, probably erected not long before the Reformation, replaced one built within a hundred years of the Norman Conquest. The materials of this earlier church had been used in building the new one, and of this circumstance the tower arch affords a remarkable example. The jambs probably remain as they were originally, but the semicircular arch has been taken down and rebuilt as a pointed arch, with the stones as wrought for its predecessor. The principal feature of the decorations is a very bold zig-zag, not carried all round, but interspersed with other plainer moulds from the same or some other arch. The caps and abaci are enriched with ornaments such as are usually found in the finest and most elaborate examples of Norman work.

The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels held its last meeting but one for the present session this week at the society's house, 7, Whitehall, S.W., His Grace the Archbishop of Canterbury (President) in the chair. Grants of money amounting to £1,090 were made in aid of the following objects:—Building new churches at Bethnal-green, St. Mark, London; two churches in the extensive parish of Holbeach, Lincolnshire, Jarrow (Christ Church), Durham; Millwall (St. Luke), parish of Poplar, London; and North Ormesby, near Middlesborough; rebuilding the churches of Kenarth, near Carmarthen; Taf Vechan, near Talybont, Brecon, and West Lulworth, near Wareham, Dorset. Enlarging or otherwise increasing the accommodation in the churches at Bampton, near Farringdon; Beaconsfield, Bucks; Hannington, near Northampton; Linsdale, near Leighton Buzzard; Maidstone, St. Philip; Middleton Stoney, near Bicester, Oxon; Minster, near Boscastle, Cornwall; Munslow, near Church Stretton, Salop; and Wimbledon, Holy Trinity. The grants formerly made towards building the church of St. Columba, Haggerstone, and restoring the church at Broadwood Kelly, North Devon, were each increased. The society likewise accepted the trust of sums of money as repair funds for the new churches at Southsea, St. Simon, Hants, and Chapmanslade, SS. Philip and James, near Westbury-on-Trym, Wilts.

BUILDINGS.

On Thursday week the foundation stone of a new Townhall was laid at Gateshead. The style of architecture will be Italian, treated with some freedom in the details. The design is not elaborate, but the massive and substantial character of the structure, combined with its good proportions, and the studied boldness of its main features, are likely to render it a striking object, expressive of the purpose for which it is being erected. The architect is Mr. John Johnstone, of Newcastle; the contractor, Mr. Bulman, of Exeter; and the clerk of the works, Mr. William Burnip, of Gateshead. A very distressing accident took place during the ceremony. One of the platforms gave way, and about 400 persons were precipitated to the ground. Over fifty were seriously injured, but fortunately no lives were lost.

On Tuesday the new building of the Leeds Church Institute was opened with due ceremony. The style is English Gothic of the fourteenth century, and the building is constructed of brick, with stone dressings and coloured bands. The entire cost of the building was about £4,000. Messrs. Adams and Kelby, of Leeds, were the architects.

A new wholesale and retail market will be opened in a few weeks at King's Cross, immediately adjoining the Great Northern Railway terminus. The market covers an area of more than an acre, and contains separate and ample accommodation for the wholesale fish, meat, poultry, provision, and fruit and vegetable trades. In addition there is a spacious covered retail market containing about ninety stalls.

The foundation stone of the Royal Albert Asylum was laid at Lancaster, with full Masonic ceremony, on Wednesday. The design is Gothic, adapted to modern requirements. The whole of the exterior is built of durable light-coloured freestone, and the walls are lined with brickwork. The plan of the building is something in the form of the capital letter E. The building will accommodate 500 inmates, at a cost of £60,000. Mr. E. G. Paley, of Lancaster, is the architect, and Mr. Baynes and Mr. Blades, both of Lancaster, the contractors respectively for the masonry and woodwork.

The seventeenth exhibition of fine arts at Bordeaux, now open, is said to be superior to any that have preceded it. The number of works exhibited is 635, and they include specimens of some of the best living French painters, and of some lately deceased artists; amongst the latter is the "Source," by Ingres, the property of the Countess Duchâtel. The purchases amount to £3,200, besides two works bought for the museum of Bordeaux, of which the price is not given. The works which have found purchasers are of all classes—paintings by Duverger, Landelle, Ribot, Antigna, Bonheur, Bourgeois, Chaplin, Paul Flandrin, Phileppoteaux, and many other well-known artists, and sculpture and bronzes by such artists as Carpeaux, Carrier Bellouse, and Paul Dubois.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—G. T. R.—L. J. D.—T. G.—G. H.—M. G.—I. F.—R. T.—I. W. F.—I. D. W.—I. P. S.—W. R. D.—I. H. C.—T. N.—W. H. R.—I. R.—I. F.—T. and A.—E. P., Stoke, with photo's.—R. L. B.—G. and C.—I. H.—E. F.—I. W. P.—H. B.—W. Y.

W. C. F. HARBORNE.—We should like to know more of the *modus operandi*.

CARPENTER.—We cannot understand how it is you have not received any reply or notice from so respectable a firm, Messrs. Virtue, of Ivy-lane, now publish most, if not all the treatises of the "Weales Series," and it might be as well for you to address them on the subject.

Correspondence.

MR. MOORE'S DECORATIONS.

To the Editor of the BUILDING NEWS.

SIR,—The letter which I addressed you last week upon this subject arrived, it seems, too late for publication. In it I gave my unequivocal denial to the assertions of Mr. Moore and your other correspondents, which I again repeat, that the drawings had been altered since they came into my possession, excepting only the colour of the seating of the three tiers of galleries, which has been darkened. But it is the veriest nonsense to speak of this, as it forms no portion of the decorations at all. On Saturday last, however, I received a letter from the young man, *a friend of Mr. Moore's, and a painter in water colours*, who prepared the drawings for me partly at mine and partly at Mr. Moore's chambers, under his direction, saying that in the sketch of the ceiling I made certain suggestions while the drawing was in progress, which he carried out, as he now asserts, without Mr. Moore's knowledge. I confess this is the first time I have heard of this, which appears to me the weakest of special pleading, the sketches forming the subject of almost daily discussion during their preparation, and I should never have dreamed of appropriating a single line of that sketch to myself; nor can I, after a careful examination of the drawing, detect the alterations Mr. Moore complains of. However, it is a very simple matter, if Mr. Moore wishes it, to erase his name from the drawing altogether, a course which I doubt not the committee of the exhibition will permit. When your anonymous correspondents speak of "that impertinent interference with artists which is too possible," they, perhaps, do not consider that if artists wish to be engaged on more lasting and higher work than simply easel pictures, they must, in a measure, work *with* the architect who employs them, who, it must be presumed, has as much interest in any scheme *as a whole* being successful as the artist who aids is anxious for his own particular portion, be it a figure subject, or otherwise. Had more of this spirit been shown at the Queen's Theatre, I should not now have to deplore the utter want of harmony between the general decoration and the frieze which Mr. Moore painted.—I am, &c.,

CHARLES J. PHIPPS, F.S.A.

26, Mecklenburgh-square, June 15.

THE LATE NATIONAL COMPETITIONS.

SIR,—Your readers are aware that, after very much discussion and delay, it has been determined that Mr. Edward M. Barry shall be the architect of the new National Gallery, Mr. George Edmund Street the architect of the new Law Courts, and that the completion of the new Government Offices shall be confided to Professor Scott. You have ventured to assent to this decision, and to express a hope that these gentlemen will now hestir themselves to give the nation grand works deserving of the high patronage it has accorded to them. But, in saying this, I suppose you do no more than express what you perhaps hold in common with all Englishmen conversant with the subject, a tacit acquiescence in an award to which we have become resigned as the best under all the circumstances that have arisen and all the false steps that have been irretrievably taken in connection with these three famous but very unsatisfactory competitions. In the case of the National Gallery, we have had a limited competition, resulting, as everyone says, in the production of a group of most unsatisfactory designs, useful only as a means of showing Mr. John Bull "how not to do it." As an architectural work, Wilkins's edifice in Trafalgar-square has been severely condemned, but whether well or ill, no one can surely say that Mr. Edward Barry's design is an improvement upon it. His was one of the best, perhaps *the* best, of the commonplace designs exhibited at Westminster, but in architectonic power and invention we hold it to be immeasurably inferior to the present building, with its bald podium and pediment, "pepper boxes," and all. Mr. Barry has produced an excellent plan, but an exterior design, or, to use his own term, "elevation," altogether unworthy of his, or at least of his father's reputation. Now the National Gallery is just that very building for whose successful construction a good plan is not the "be-all and end-all." Looking at such smaller works as the Royal Institution at Manchester, or even at the old townhall in that city, or, again, at the Fitzwilliam Museum at Cambridge, one cannot but hope that the architect of the new National Gallery, if he be not overburthened with other professional work, will give the nation an edifice of more pretension to grandeur, and, above all, of individuality, than is offered in his beautifully executed competition drawings: and I express the hope (not the mere wish) sincerely, remembering, as we all should do, that Mr. Edward Barry, while competing for the National Gallery, was also engaged on another elaborate design for the new Law Courts. I trust he has been "selected," as he tells us in the morning papers Mr. Street has been in the case of the Law Courts, "not for what he has done, but for what he may yet do," and, so saying, bow to the decision of the authorities, desiderating in all future cases of the kind a national—nay, a cosmopolitan—competition in place of these abortive "limited" competitions, of which I devoutly trust the competition for the Law Courts will be the last.

Let anyone ask himself whether on the whole the open competition for the new Townhall at Manchester has not been a great success, and the two recent limited competitions been on the whole a failure. Who knows now what unheard-of talent, possessed by some tyro, hereafter destined to employ it in assessing dilapidations and altering old tenements, might not have been elicited by an open instead of a limited competition for the National Gallery and for the Law Courts? Of one thing I feel certain—the country may well feel proud of such architects as the authors of the three designs for the Manchester Townhall, which will be found engraved in your journal. We owe our knowledge of them to the principle of open competition. Next to the evil of no competition at all is a limited competition, in which all the competitors, good, bad, and indifferent, are to get a fixed sum for their drawings. We see the wretched result in these two great national competitions now decided. It merely intensifies one of the worst abuses of the unreformed open system, warrants Mr. Digby Wyatt in getting up a big view of his design for the National Gallery, and Mr. Seddon in producing a bigger one—perhaps *the biggest* ever made—for the Law Courts, and leaves the gaping public to wonder whether the two were tinted from a ladder, or from a movable scaffold. Competitors should certainly be placed on a fairer equality with respect to the sizes and the number of their pictorial drawings, as anyone might see at Lincoln's Inn, where the contrast between Mr. Burges's one little view and Mr. Scott's several big ones was a manifest hindrance to fair discrimination between the two designs, as such. It is an old, old tale; as none knows better than the talented proprietor of the biggest of these *magnum bonums*.

It will be seen from these remarks that I do not take part in "the solicitude of some friends to the right management of competitions," who, with the *Builder*, wish to deprive Mr. Street of his commission to build the new Law Courts. There are very few architects who did not entertain a preference for the design of Mr. Burges; but fewer still who did not appreciate the high merit of Mr. Street's design. I am sorry to see your contemporary is one of these very few, and that his advocacy of Mr. Edward Barry's claims has led him quite away from his usual delicacy and reticence where criticism of any sort is looked for. Will it not be best to let well alone? We have, it seems, got out of these two precious competitions a National Gallery *plan* whose "elevation" will not do at all, and a Law Courts *design*, whose plan (so says the *Builder*) "is out of the question." It is a very unpleasant reality, and to deal with it we would suggest that the two architects had best make ends meet as well as they respectively can, the one by cobbling up his plan, the other his elevation.

SOLOMON SET-SQUARE.

ART UNION OF LONDON.

SIR,—I think it is high time to call attention to the behaviour of the committee of this society. They advertised some time ago for a series of designs, which were sent in on March 2 (three months and a half ago), and from that time they have not, so far as I am able to learn, moved in the matter. Competitions are at all times ticklish things, and the more open and aboveboard the proceedings are, the more satisfactory it is for all concerned, and, were it not for the honourable names on the committee, all sorts of suspicions might be current relative to the motives which have brought about this most unreasonable waste of time. It is, I think, due by the committee not only to proceed to the conclusion of this matter at once, but also to give the competitors some account of the reason of this unseemly delay.—I am, &c.,

W. B.

Intercommunication.

QUESTIONS.

[883.]—A GOOD AND SUFFICIENT FENCE.—In the deed of a plot of ground a clause stands thus: "To erect and for ever maintain a good and sufficient fence." Could you, or any of your readers, give me the legal definition of the same; in fact, what I can be compelled to put up?—S. T. R.

[884.]—ARCHITECTS' BENEVOLENT SOCIETY.—If anyone would supply me with a word or two of information on the constitution of this society, and what means should be adopted in order to obtain relief from its funds, he would confer a favour on—AN OLD PROVINCIAL ARCHITECT.

[The object of this society is limited strictly to benefit those engaged professionally in all branches connected with architecture, their widows and children, excluding only such as have in any way been engaged in, or are deriving emolument from, the executive department. Annual subscribers of one guinea, or donors of ten guineas in one donation, are members, whether professional or otherwise, and will be entitled to vote and take part in the proceedings at all general meetings, and in the election of officers and council. Applicants for relief must strictly conform to the following rules:—1. The candidate for relief must be of good moral character, and known to be honourable in his practice; he must have been duly educated in an architect's or surveyor's office, or he must give such evidence as may be satisfactory to the council of his having produced a valuable invention or work of art useful to the profession, or must be the widow or orphan child of a person so qualified. 2. No one who has embarked in speculations in trade or bills of exchange, or transactions inconsistent with his profession, can be admitted as an applicant. 3. Applications for relief must be transmitted to the secretary or his assistant on or before June 1 or December 1, certified by two subscribers, one of whom shall state his knowledge of the truth of the statement made. The distribution of the funds takes place in the months of January and July. 4. Relief can be afforded only once within twelve months to the same applicant, unless in an urgent case of sudden distress occurring after relief has been granted. 5. Urgent cases, entitled to immediate assistance, are limited to such as arise from the death of a near relative, sudden illness, distraint of household goods, imprisonment, fire, or other unavoidable calamities. 6. Applications for relief or urgent cases may be made at any time, but they must be certified by four subscribers, one of them testifying, by letter, his knowledge of the truth and merits of the case. 7. Every widow must transmit the certificate of her marriage and of the burial of her husband. 8. Orphans must produce certificates of the marriage of their parents, and of their own baptisms, or other satisfactory evidence of their identity. 9. The names of persons relieved by this society are not made public.]

[885.]—CONSTRUCTION OF FLUES.—Will you, or some of your correspondents, inform me the method of constructing flues from the boiler of a manufactory so as to consume its own smoke?—MASON.

[886.]—MAKING A POND.—Can one of your correspondents kindly inform me the best method of making a pond? Will bricks or tiles laid in cement stand all weathers in an exposed situation?—J. W.

[887.]—INSTITUTION OF SURVEYORS.—I see that an institution of surveyors has been established in London. Will you please inform me what are the qualifications of membership, the fees to be paid, and whether any country surveyor may become a member?—COUNTRY SURVEYOR.

[888.]—RESISTANCE OF STONE TO FROST.—Is there any reliable means of testing the tendency of different kinds of building stones to exfoliate by the action of frost? If so, will some of your correspondents kindly point them out?—J. T., Keynsham.

[889.]—KAUREE PINE.—Can any of your readers give us the benefit of their experience in the behaviour of this wood, apparently so desirable for joinery? It is proposed to us for use in dowelled flooring.—WILLSON AND NICHOLL, 126, Marylebone-road, N.W.

REPLIES.

[830.]—PARTY WALLS.—Your correspondent "J. P." in his future operations with respect to his houses, will do wisely to bear in mind the legal maxim "*sic utere tuo, ut alienum non ladas*." While there is no question that he may build another storey, as he wishes, yet if he occasions any pecuniary damage to his neighbour he is sure to suffer for it, even if in nothing else than legal costs. SOLICITOR.

[833.]—CEMENT FOR BROKEN LEATHER MACHINE BELTS AND STRAPS.—Gutta percha dissolved to the consistency of treacle in bisulphide of carbon is an excellent cement for leather belts and straps. The parts to be joined must be well thinned down, and a small quantity of the cement spread on each end; then warm the parts over a fire for half a minute, apply them quickly, and hammer well on a level surface. This cement will wear for two years or more.—BONA FIDE.

[833.]—Allow me to inform "General Joiner" the plan I adopt when a belt or strap breaks. I get a good piece of leather and make a graft, fixing it firmly with copper rivets. This plan I always find answer well. I do not think cement of any kind will stand the strain required.—ONE OF THE SAME TRADE.

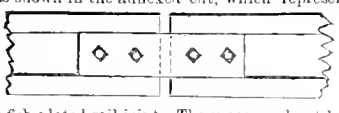
[834.]—COTTAGE WALLS.—Build your foundations 18in. wide of rubble work, 12in. above ground line; insert a damp course, and the superstructure of brickwork 14in. thick.—F. H. L.

[835.]—STEEL TOOLS.—There is a great deal of useful information on steel in the "Management of Steel," by George Ede. Use is the only way whereby to test the quality of fine steel tools. If aqua fortis be applied to the surface of steel previously brightened, it immediately produces a bright spot; but if applied to iron the metal remains clean.—W. W.

[836.]—PLASTERING WALLS.—If the walls are built hollow of brickwork in cement, on a strong and well laid damp course, and if they have not been exposed to rain and other moisture, I should say that they would be fit for painting at the end of two years, and sooner if dried by artificial means. It is considered that bricks absorb one-fifteenth of their weight in water: lime, or Portland cement and sand, required to mix into mortar, one third of their bulk of water. It is on this that I base my calculations that all moisture, by the time above stated, should be evaporated, and the walls perfectly dry for the painter.—C. W.

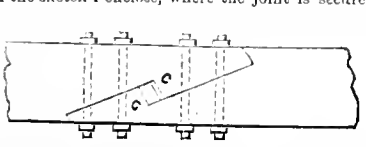
[837.]—WORKING LINES OF A NICHE.—Purchase "Nicholson's Work on Masonry."—F. H. L.

[874.]—EXPANSION OF RAILS.—The expansion of rails is provided for by leaving a small space between each length, as shown in the annexed cut, which represents an



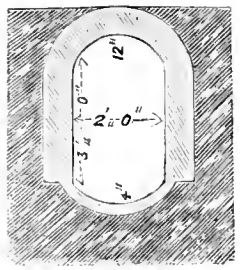
ordinary fish-plated rail joint. The space need not be more than about the eighth part of an inch. The amount that a rail or any other bar of rolled iron would expand between certain temperatures may be easily calculated. Let L equal the length of the rail at a temperature t, and L^1 the length required at a higher temperature t^1. Putting C for the coefficient of the expansion of wrought iron, we have $L^1 = L(1 + C t^1)$. Substituting for C its value 0.000035, $\frac{}{1 + C t}$ and for t and t^1 the least and greatest temperatures to which the rail is exposed, its expansion can easily be determined. At the same time, the average length of rails does not exceed 21ft. About 15ft. was the limit, but they are now rolled up to 27ft., and even longer.—A. E.

[880.]—SCARFING TIMBER.—"Carpenter" will find that timber may be scarfed in a sound, workmanlike manner, in the sketch I enclose, where the joint is secured by



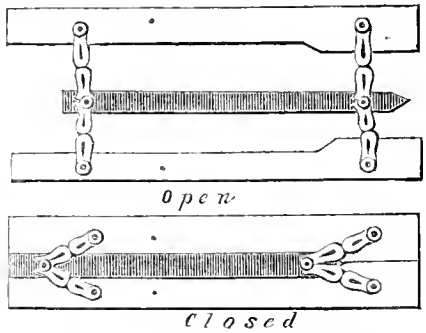
driving the small wedges c c well home. With respect to his second question, a strap is preferable to a bolt, as it avoids making a hole in the balk, and thus diminishing its strength. Straps may be used in the scarfing joint I have given, and will make a better though rather more expensive job than bolts. In all the details of carpentry work, the rule to bear in mind is to make as few holes and cuts as possible in the timber.—APPRENTICE.

[881.]—FLOW OF WATER.—Allow me to inform "C. P." that, theoretically speaking, the egg shaped sewer is the best, but it is rather a troublesome one to construct. For the case he alludes to, a plain culvert would answer perfectly well, having the following dimensions shown. The invert should certainly be turned in Portland, not



Roman cement: and it is sometimes necessary to build the whole sewer in cement also.—BUILDER'S CLERK.

[882.]—PARALLEL RULER.—This description of parallel ruler is obviously preferable to the common one, and is



respectfully recommended to the gentleman who discovered a difficulty in drawing parallel lines.—F.

[882.]—Parallel lines can be drawn easily and rapidly by a T-square. It should be made like an ordinary T-square, the crosspiece of square to be made in two pieces, the blade fixed in one of the pieces, the other piece to move on a thumb-screw connecting the two together. I think "Parallel Ruler" will find this answer his purpose, being both a square and a level.—J. B.

WAGES MOVEMENT.

THE workmen of at least two of the principal master masons in St. Andrew's, N.B., went out on strike on Monday, in consequence of the masters having signified their intention to reduce the wages ½d. per hour.

The wages of operative joiners in Crieff have for some time past been 20s. a week of fifty-seven hours, but the men, considering that they were working at lower rates than those paid at other places, applied for a rise of 2s. 6d. per week. This the employers refused to give, and the result was that none of the journeymen returned to work on Monday.

The bricklayers of Taunton, county town of Somerset, have struck for an advance in their wages. Their demand is an addition of eightpence per day upon the present rate.

STATUES, MEMORIALS, ETC.

THE House of Commons has received a promise on behalf of Mr. A. Stevens, that the Wellington monument for St. Paul's, which has been so many years in the hands of the sculptor, should be "approaching completion in the course of the year 1869."

On Friday last the statue to the memory of the late Mr. Cobden was lifted to its pedestal on the site granted by the vestry of St. Pancras, at the entrance to Camden Town. It stands nearly 9ft. in height, upon a pedestal of some 15ft. or 16ft., and has been cut out of a solid block of fine Sicilian marble of 7 tons. The figure itself weighs nearly 3 tons. Messrs. Wills, of the Euston-road, are the sculptors.

The monument to Richard Oastler, the "Factory King," is to be placed in front of the Midland station, at Bradford, during the ensuing autumn. About £300 is required by the committee to cover all expenses.

A marble bust of the late Prince Consort has just been placed in the plant house of the Royal Botanic Gardens, Regent's Park. It is the gift of Sir Walter Stirling, Bart., and was executed by W. Theed, Esq., under the immediate superintendence of her Majesty.

STAINED GLASS.

THE chancel window of St. Michael's Church, Worcester, has been filled with stained glass by Messrs. Done and Davies, of Shrewsbury. The window is of three lights, the subject being the Crucifixion. The same artists have also just finished another window for the parish church of Bishop's Castle. It consists of two openings, with tracery. The subjects are the four Evangelists, with their emblems.

BUILDING AND LAND SOCIETIES.

THE annual meeting of the Earl Shilton Building Society was held at Earl Shilton, last week. The report which was adopted, was very satisfactory. The society have had out of borrowers to the extent of £5,150 only two or three defaulters and their debts are amply covered by the value of the property mortgaged the society has now existed eleven years, and it was suggested that as the fourth and last will be declared next year to depositors who commenced with the society, and that as they will receive their shares, which may be worth £60, when only £10 12s. 6d. shall have been paid, the event should be celebrated by some public festivity.]

LEGAL INTELLIGENCE.

THE ATLAS BRICKWORKS.—STEVENS *v.* PAINE.—Mr. W. M. James, Q.C., and Mr. C. Hall moved before the Vice-Chancellor to continue an interim injunction restraining the defendants from issuing circulars calculated to mislead the public and induce the belief that the business carried on by the plaintiff's testator at the Atlas Works, Woodfield-road, Harrow-road, under the firm of Henry Clayton and Co., is no longer carried on, and also restraining the use of any patterns, or castings of patterns, of the firm of Henry Clayton and Co., obtained by the defendants while in the employ of that firm. It appeared that previously to December, 1865, the late T. B. Dixcee had for some years been engaged in the business of consulting engineer and machinist at the Atlas Works, in partnership with Mr. H. Clayton, under the style or firm of Henry Clayton and Co. In December, 1865, the partnership was dissolved, and the goodwill of the business and the patent rights and patterns were appropriated to Dixcee, and by subsequent arrangements a lease of the Atlas Works was granted to him, where he continued to carry on business as "Henry Clayton and Co." until his death in April, 1867. The plaintiff Stevens was acting executor of Dixcee, and in accordance with the directions of his will had carried on business at the Atlas Works as "Henry Clayton and Co.," since Dixcee's death, until the 1st of April last, since when the business had, in accordance with a decree in a suit for the administration of Dixcee's estate, been carried on by H. F. Ransford, the receiver in the cause. The defendants, Paine, Slaughter, and Amor, had been employed at the Atlas Works as foremen and clerk until recently, and were now carrying on business in partnership as constructive engineers and machinists at the Globe Works, also in the Woodfield road. They had recently issued the following circular:—"We beg most respectfully to inform you that we have opened the above works for the manufacture and sale of precisely the same class of brick, tile, and pipe-making and pressing machinery (as lately made by the firm of Henry Clayton and Co., of the Atlas Works, Harrow-road, where we have been employed for a number of years, and, in consequence of the decease of the late principal, have commenced business on our own account), and having made vast improvements in the same, beg to say that we can supply any machinery at a much reduced price, consequent upon the patents on them being out, and ourselves being satisfied with smaller profits. Any repairs or new portions of Clayton's or any other machines you may require we can supply you with on the the shortest possible notice. We are compiling a catalogue, and as soon as same is ready we shall have the pleasure of forwarding you a copy, but meanwhile beg to call your polite attention to the prices on the other side of a few of the machines which we manufacture, and which will bear comparing with H. Clayton and Co.'s published prices." The case made by the bill and affidavits in support of the motion was that the effect of this circular was to induce customers of Henry Clayton and Co. to believe that the business had ceased to be carried on, and thereby the goodwill would be very much lessened in value. The Vice-Chancellor after hearing counsel decided that the only inference that could be drawn from the circular was that the machines were no looger made by Clayton and Co., and that therefore the injunction must be continued.

ACTION FOR TRESPASS.—TULK *v.* THE METROPOLITAN BOARD OF WORKS.—This was an action of trespass, and the great question was whether Leicester-square was within the jurisdiction of the Metropolitan Board of Works. It appeared that formerly the land of which Leicester square formed a part belonged to the Earl of Leicester, and by different conveyances the part called the square became the property of Tulk, and there was always a condition that the square should be kept open, and in a proper state for the use and enjoyment of the inhabitants, who, if they chose to use it as a promenade, should pay a rental for the same. It was submitted that the square surrounded by iron railings had been set apart for the use and enjoyment of the inhabitants, and it was so set apart otherwise than by the revocable permission of the owner. At one time the houses and shops surrounding the square had been held under leases, but the last of those expired in 1847. Mr. Tulk had covenanted to keep the square without any building upon it, but in an ornamental state, and not to suffer the statue to be taken down or defaced. The Board had entered upon the square, on the ground that the square was in a neglected state, and they acted under the statute. There was an action of trespass. The Court below decided for Tulk. After hearing counsel on both sides the Lord Chief Baron delivered judgment. The Court were of opinion that the judgment of the Queen's Bench must be affirmed. The question was whether, under the Act, the Metropolitan Board was entitled to enter upon this garden and commit the act they had proceeded to do. The words of the first section raised the question. It was said to be for the protection of the garden or ornamental ground set apart for the public or the inhabitants; and it then enacted that when any enclosed garden or ornamental ground had been set apart for the public or the inhabitants, and the owners neglected to keep it up in a proper state, then power was conferred upon the Board to enter, &c.; and the question and the sole question was whether this square, called Leicester-square, had been set apart for the use or enjoyment of the inhabitants thereof. He was of opinion that in order to comply with these words some right, some legal right must by some means have been conferred upon the inhabitants of the place in question; and the question was whether that had been done. He was of opinion that no such right had been conferred, and that no inhabitant had a right to enter upon the square without the express permission of the owner. Mr. Baron Bramwell would add one word,—that he did not think it was open to the owners to build upon it.—Judgment affirmed.

THE WORKSHOPS' REGULATION ACT.—12 HOURS OR 13½?—At the St. James's Vestry, Mr. Buzzard, the vestry clerk, stated that, in accordance with instructions given him by the vestry, he had taken counsel's opinion as to whether the 12 hours mentioned in the Act did or did not include the 1½ hour required for refreshment and rest. At first, Mr. Keane, the counsel applied to, was inclined to think with him that the 12 hours included the 1½ hour, but, on further consideration, he came to the conclusion that it did not do so; consequently, a person might be employed 13½ hours, including the 1½ hour for rest and refreshment.

DEATH THROUGH NEGLIGENCE.—MOORE *v.* DENTON AND ANOTHER.—This was an action brought by the widow of a bricklayer against the two defendants to recover damages

for the death of her husband, which was caused by their alleged negligence. The defendants pleaded "not guilty." It appeared that in February last the defendant Shipney, a publican at Finchley, employed a carpenter to design a building, and employed the defendant Denton, a builder, to carry out the design. In the course of the execution of the work a wall fell and killed the deceased, a working bricklayer. The defence was that neither of the defendants was liable, inasmuch as Shipney had only employed Denton, who had employed the deceased, and Denton was merely engaged in carrying out the design of an architect. The jury, after having retired, found a verdict against both defendants, on the ground that Shipney had employed an unskilful person to design the building, and that Denton was guilty of negligence in endeavouring to carry out a design which he must have known to be faulty. They assessed the damages at £650, to be apportioned thus:—£200 to the widow, and £450 to be divided among her six children.

MEETINGS FOR THE ENSUING WEEK.

MON.—Royal Institute of British Architects.—To proceed to ballot for members. The following papers will be read:—"On the Terra-cotta Work adopted in the New Alleyne College, Dulwich," by C. Barry, and "A Short Description of the Plans of Hospitals at Paris, Munich, and St. Petersburg," by Dr. Oppert.

TUES.—London Mechanics' Institution.—Lectures to working men on science and industry. "On Mechanical Drawing," illustrated, by E. A. Davidson, Esq., S.

WED.—Society of Arts.—The one hundred and fourteenth annual general meeting, for receiving the councils report and treasurer's statement.

Our Office Table.

There is some talk of repairing the Eagle Tower of Carnarvon Castle, so as to make it available as a museum for the counties of Carnarvon, Anglesey, and Merioneth.

The directors of the Manchester Royal Exchange, at their meeting last week, received eight tenders, from as many eminent building firms, for the erection of the new Royal Exchange. The tender accepted was that of Messrs. Parker and Son, of Liverpool, who are at present engaged in the erection of the Liverpool Exchange, and who have just completed the new Corporation Buildings in Dale-street.

The Leeds Property Owners' Protection Society have been in communication, through Mr. Baines, with Earl de Grey, asking for an amendment of the Artisans' and Labourers' Dwellings Bill, in respect of adequate compensation to owners of property, when such is closed, demolished, or destroyed by the authorities. Earl de Grey replies "that the point raised will be fully considered by the select committee; and if the just claims of the owners of property are not met by compensation, some means will be taken for that purpose."

The St. Luke's guardians have appointed Mr. Hill as surveyor to the gift estates of the parish, *vice* Mr. Christie resigned. The remuneration is derived from fees only.

The Hon. Society of Gray's Inn have appointed Mr. Isaacs as their surveyor, who is also surveyor to the Holborn Board of Works.

The Bethnal-green Guardians have sealed the contract for the alterations at Leytonstone House, and Mr. Munday, the surveyor, has submitted plans for a lodge and receiving ward at the same establishment, which have been accepted.

The plans of the new infirmary, about to be erected by the Paddington Board of Guardians, at an outlay of £11,300, have been approved of by the local board.

Members and others having occasion to refer to the Institution of Civil Engineers during the next few months will find that the offices have been temporarily moved to No. 1, Great George-street, as the alterations now in progress in the old building are so extensive that it was impossible to continue in occupation there.

A picture, by an old Dutch artist, representing the exhumation of the body of St. Hubert, has just been added to the National Gallery.

A correspondent in the Birmingham district, writing on the state of the hardware trade, remarks that the damaging effect of foreign competition is likely to give a great impetus to the educational movement in that town and district. It is getting to be known, he says, that in some branches, machines, invented and made in England, produce better goods in the hands of educated workmen on the continent than can be obtained in workshops in this country.

The crown and state dress of King Theodore have been temporarily deposited in the India Museum.

The gold medal attached to section I of the Halton Industrial Exhibition, under which competition was invited, for the best block of model cottages, was awarded to Mr. A Mayne, of Aylesbury, who exhibited models of cottages, which he proposed to erect at £225 a pair. By the terms of the competition, the successful competitor has to erect one pair of cottages at the price named.

The annual conversazione of the Royal Institute of British Architects will be held on July 19 next. Members who have any works of art which they may be willing to lend for exhibition on the occasion are requested to communicate with the assistant secretary, stating the size and nature of the objects to be lent, and the hours between which they may be fetched. They should be ready for delivery at least two clear days before the date of the conversazione. It being deemed advisable to arrange and lessen the mass of papers, which have accumulated since the foundation of the Institute of Architects, members are informed that there are in stock several of the annual reports, and some detached copies of the papers read in former years at the evening meetings, which can be had, without charge, to complete defective sets, on prompt application to the librarian.

The works of the important improvement in Whitechapel, by extending the Commercial-road in a direct line to the corner of Leman-street (Red Lion-street), High-street, Whitechapel, are in a very forward state of progress. The demolition of houses and other buildings has been very extensive, and is still continued. A very great clearance has been effected in High-street, Plough-court, Leman-street, Colchester street, Back Church-lane, Church-street, and the west end of the Commercial-road. The remaining houses required for the formation of the new street by the Metropolitan Board of Works have been vacated by the occupiers, and preparations are being made to raze them to the ground.

The subject of the "Stanhope" essay, read by Mr. T. R. Buchanan at the Commemoration Festival, on Wednesday, at Oxford, was "The Effects of the Renaissance on England."

We mentioned last week that the shaft of the "King's Cross" at Arran had been carried away and used in the construction of a dyke. Somebody has moved in the matter, and the stone being fortunately uninjured, it is to be restored to its original position. The explanation given by the person who removed it is that he did not think any especial value was attached to the stone.

The Corporation of London have paid for rent of Southwark Bridge, during three and a half years, £18,868; and now pay for purchase of the bridge £200,000, making a total of £218,868. The Chamberlain has handed cheques to the Comptroller for the completion of this purchase, and the legal documents being completed, the bridge is now handed over to the Corporation, and becomes free for ever for the public use.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

3294 G. F. REDFERN. IMPROVEMENTS IN PAVING (A communication.) Dated November 21, 1867.

According to this invention the patentee makes blocks or slabs of small stones, bound or cemented together in moulds of the required sizes, with asphalte or other bituminous cement. These blocks or slabs are laid on a concrete foundation, and can be laid down and taken up from the streets and roads as easily as the flagstones of foot pavements.—Patent abandoned.

3364 W. R. LAKE. AN IMPROVED SPRING HINGE. (A communication.) Dated November 27, 1867.

This invention relates to a simple device which is well adapted to take the place of ordinary door and other hinges, or may be used in connection with the same simply as a spring. The invention consists, chiefly, in constructing and arranging the two parts or leaves of the hinge in such a manner that one part, or a portion of the same, forms the spring to act upon the other part.—Patent completed.

Trade News.

TENDERS.

TO THE EDITOR OF THE "BUILDING NEWS."

SIR,—I beg to hand you for insertion in your next issue a list of tenders I received on the 6th inst., and I do so because they were unfairly stated by some one in last week's *Builder*.—I have no doubt by one of the three firms whose tenders I was bound in honour to reject. I annex them as quoted in the number of the *Builder* to which I refer, and also as they should be inserted.—I am, &c.,

14, St. Helen's place, E.C., EBENEZER GREGG.
London, June 16.

(Copy) From *Builder*, June 13, 1868.

For building No. 50, Old Broad-street:—

*Holland and Harmer	£10,327
Trollope	9860
*Mansfield	9860
Cubitt	9850
Jackson and Shaw	9743
Ashby and Horner	9700
Ashby and Sons	9647
*Lawrence and Sons	9430

* The tenders of Messrs. Holland and Harmer, Messrs. Mansfield, Price, and Co., and Messrs. Lawrence and Son were not received, because they would not deliver them on the required form.

LONDON.—For additions to No. 50, Old Broad-street, for Mr. Sands. Mr. E. Gregg, architect. Quantities by Mr. R. Roberts:—

G. Trollope and Sons	£9860
W. Cubitt and Co.	9850
Jackson and Shaw	9743
Ashby and Horner	9700
Ashby and Sons (accepted)	9647

ASHTON-UNDER-LYNE.—For erecting St. Peter's parsonage, Ashton under Lyne. Medland and Henry Taylor architects:—

John Thompson	£1868
W. Storrs	1860
J. and G. Longson	1790
Joseph Thompson	1787
Thomas Clay	1695
James Grundy	1635

BOLTON-LE-MOORS.—For reseating nave and forming "chorus cantorum," &c., for Holy Trinity church, Bolton-le-Moors. Medland and Henry Taylor, architects:—

James Grundy	£978
John Thompson	819
W. Clark	750

BURTON-ON-TRENT.—For the new Infirmary and Dispensary. Mr. Edward Holmes, architect:—

Jefferey and Pritchard	£3250 0 0
Webb	3211 0 0
Horsley Brothers	3044 0 0
Lovatt	2990 0 0
Matthews	2891 0 0
Gregory	2884 15 0
Maddocks	2860 0 0
Trow and Sons	2829 0 0
Wielman and Wigley	2813 0 0
Hadfield	2797 0 0
Smith and Chamberlain	2774 0 0
Bowler and Beck	2740 0 0
Clarke	2621 19 0
Mason	2620 0 0
Lilly and Son	2616 1 0
Nelson	2613 0 0
Neale and Sons	2592 0 0
Hardwick and Son	2591 0 0
Lowe and Sons	2488 0 0
Lilly	2360 0 0
Hunter and Bennett (accepted)	2312 16 10

CHESHIRE.—For erecting Wltinstow parish schools. Medland and Henry Taylor, architects. Quantities by Mr. H. Breary:—

John Thompson	£2146
J. Robinson and Son	2000
Thomas Hawe	1995
Arthur Warham	1968
John Lane	1960

EASTBOURNE.—For the construction of brick and pipe sewers, and other works for the Local Board:—

	Contract 1.	Contract 2.	Contract 3.
Rodger	£1235 11 3	£1582 17 0	£580 9 0

* Accepted.

ESSEX.—For cottage residence, Romford, Essex. Mr Charles Pertwee, architect:—

A. Davey	£509 0
W. Roper	507 0
J. Hammond	498 10
G. W. Death	490 0
A. Bacon	405 0

ESSEX.—For reseating and improving Bocking Chapel, Essex:—

Mr. James Browne (Braintree)	£1068

FINSBURY.—For rebuilding the Whitfield Tabernacle, Moorfields. Charles G. Searle and Son, architects. Quantities supplied:—

Browne and Robinson	£4804
Patman and Fotheringham	4613
Hedges	4395
Ashby and Horner	4353
Perry and Co	4350
Colls and Son	4305
Brass	4255
Piper and Wheeler	4212
Higgs	4211
Newman and Mann	4154
Dove Brothers	4049

GUILDFORD.—For two small cottages, for Mr. John Smith. Mr. Henry Peak, architect, Guildford:—

Pollard and Son	£301 10 0
Mason	267 0 0
Garnett	250 0 0
Dives	245 0 0
Swayne and Sons	197 10 0

GUILDFORD.—For additions to Blackwell Farmhouse near Guildford. Mr. Henry Peak, architect:—

Loa (accepted)	£549

GUILDFORD.—For additions to the male and female Infirmaries at the Guildford Union. Mr. Henry Peak, architect:—

Strudwick	£260 15 0
Mason	258 5 0
Dives	233 17 0
Garnett	230 7 0
Loe	192 0 0
Foster	163 0 0

HAILSHAM (SUSSEX).—For enclosing cattle market. R. K. Blessley, architect:—

Crisford	£1016
Robson	917
Thompson	875
Stonestreet	806

KENT.—For building a wheel-tireing furnace, fixing two new shop fronts, and sundry repairs to house, at Hamshaw, Kent. Mr. Henry M'Calla, architect:—

Seager	£583
Foord	416

LANCASHIRE.—For fittings, glazings, &c, St. Matthews' Church, Ardwick. Medland and Henry Taylor, architects:—

Davies and Mawdsley	£1022
W. Clarke	994
M. Toggett	988
M. J. Connor	915

LANCASHIRE — For enlargement of Withington parish schools, Lancashire. Medland and Henry Taylor, architects:—

William Clark	£785 0
Benjamin Hoyland	812 10
T. Darnbrough	738 0
J. Dawes	778 0

LONDON.—For paving Latimer-street, Stepney Green:—

W. Lansbury	£181 0
Jabez Druitt	180 0
James Rollinson (accepted)	175 10

MANCHESTER.—For erecting Union Chapel, Oxford-road, Manchester. Medland and Henry Taylor, architects. Quantities by Mr. H. Pinchbeck:—

Thomas Clay	£9850
R. Neill and Sons	9600
M. Toggett	9568
Ellis and Hinchliffe	9550

RAYLEIGH.—For reseating and improving Baptist chapel, Rayleigh:—

H. Gozzett	£570
T. Thorn	555

ROCHDALE.—For rebuilding Deeplish cottage, Rochdale, for Owen March, Esq. Medland and Henry Taylor, architects:—

James Grundy	£1165
James Lord	1124

SOUTHWARK.—For the erection of five houses in King-street, Southwark, for the trustees of the Borough Market. Henry Jarvis and Son, architects:—

	Sum allowed for old materials.	
Carter and Son	£2095	£2095
Hart	2040 £30	2060
Tarrant	2046 50	1996
Rider and Son	2034 20	2014
Henshaw	1990 90	1900
Marsland and Son	1980 30	1950
Castle, jun.	1974 30	1944
Baguley (accepted)	1960 115	1845

STOCKPORT.—For erecting St. Paul's schools, Portwood, Stockport. Medland and Henry Taylor, architects:—

Gothard	£2600
T. L. Garbutt	2591
W. Forrester	2400
L. Walford	2240
W. H. Brown	2195

TORQUAY.—For villa to be erected on Vane-hill, Torquay for A. C. Stark, Esq. Mr. R. S. Wilkinson, architect. Quantities by Mr. F. S. Smith:—

R. Shinner	£1030 18 5
G. Drake	870 0 0
W. A. Goss	858 0 0
T. Gibson	850 0 0
Call and Pethick	839 0 0
J. Harvey	809 16 0
J. P. Mountstephen	797 12 0
E. P. Bovey	740 0 0

COMPETITIONS.

ABERGAVENNY, MONMOUTHSHIRE.—July 7. Designs, plans, &c., new townhall, corn exchange offices; also for reconstruction of a general market place and erection of public slaughter houses. Premiums, £50, £20, and £10. J. T. Rutherford, clerk to company.

HERTFORD COTTAGE PRIZE COMPETITION.—September 1.—Design for model cottages for agricultural labourers. Premium £10. R. Dimsdale, Esq., M.P., 9, Queen-square, Westminster.

INDIA OFFICE.—Forty appointments in Engineer establishment of India, open to competition in July next. Application to Under Secretary of State for India, India Office, S W.

LIVERPOOL.—July 1.—Plans for the conversion of property in Redcross street, Strand-street, &c. Griffith Davies, Esq, manager and secretary, Liverpool Financial Association (Limited), 32, Castle street.

LIVERPOOL.—July 21.—For plans and specifications for erection of new hospital on the site of present Everton Hospitel for Infectious Diseases. Mr. J. J. Still, 17, Water-street.

SCARBOROUGH, YORKSHIRE.—Designs, plans, and estimates for new pier. Premiums, £50 and £30 W. E. Woodall, secretary to Commissioners, Queen street, Scarborough.

ST. MARYLEBONE.—July 7.—For particulars or information of any site suitable for public baths and washhouses. Mr. Foot, clerk to the commissioners

CONTRACTS OPEN FOR BUILDING ESTIMATES.

ALDERSHOT.—June 24.—For the erection of a police station. Plans of Mr. T. Stopher, county surveyor, Winchester. T. H. Earle, County hall, Winchester.

ALDERSHOT.—July 11.—For painting, paper hanging, &c., at Cavalry Barracks. Royal Engineer Office, Aldershot.

BAMPTON, OXFORD.—June 27.—For restoration of transepts and lower part of the tower of the parish church. Architect, Mr E. Christian, 8A, Whitehall-place, S. W.

BELFAST.—June 23.—For a turret clock. J. Guthrie, town clerk, Townhall.

BROMFIELD (SHEFFIELD).—July 14.—For the erection of the new church of St. Mark. W. H. Crossland, architect, 21, Park square, Leeds.

CHERTSEY.—June 20.—For the erection of three pairs of semi detached cottages. T. Wonnacott, architect. Plans at C. Lingham's, Guildford street, Chertsey.

EASTBOURNE UNION.—June 25.—For building new vagrant wards, &c. Mr. Rumble, Eastbourne.

FULHAM.—June 24.—Contract for broken Guernsey and Jersey granite. W. Lovely, Broadway House, Hammersmith.

GATESHEAD.—June 26.—For the whole or portion of works in the erection of Christchurch, Gateshead. Adams and Kelly, architects, 18, Park row, Leeds.

HUDDERSFIELD.—June 20.—For the erection of estate offices, warehouses, &c. W. H. Crossland, architect, 25, Park square, Leeds.

LYDEARD ST. LAWRENCE, NEAR TAUNTON.—June 23.—For repairing and reseating the parish church. J. Shattock and J. William, churchwardens.

MAIDSTONE.—June 24.—Alterations to rooms adjoining the Crown Court, and Second, constructing an inner gateway, &c., at the County prison. F. Russell, clerk of the peace.

MOORBY, LINCOLN.—June 25.—For works to be done to the Parsonage house and outbuildings. C. Clitherow, architect, 17, Limneus street, Hull.

PORTSMOUTH.—June 26.—For supplying 350 to 400 cast-iron covers for manholes, &c, for drains. Mr. J. E. Greaterex, borough engineer, Landport hall, Arundel street.

SHERBORNE LOCAL BOARD WATERWORKS.—June 25.—1. For providing waterwheel, pumps, pipes, and other works. 2. For constructing about 700 yards of brick conduit, &c. Drawings, &c., Mr. Lawson, 3, Westminster chambers, Victoria street, and Mr. Noake, surveyor, Sherborne. J. Y. Melmoth, clerk to the board, Sherborne.

SOUTH-WESTERN AND BRIGHTON RAILWAY.—June 22.—For repairs at the stations on the joint line between Portsmouth and Cosham. F J. Macaulay, secretary, Waterloo Bridge station.

WAR DEPARTMENT.—Netley, Southampton.—For external painting, colouring, &c. W. C. Hadden, Colonel-Commanding, Royal Engineer Office, Portsmouth.

WEST HAM LOCAL BOARD OF HEALTH.—June 22.—For the supply of about 1,000 yards of broken granite C. Wilson, clerk, Rokeby house, Stratford.

STRATFORD-PLACE, OXFORD-STREET.—For alterations to No. 17. Mr. T. A. Klein, architect, 110, Cannon street, E.C.

CARMARTHEN.—June 30.—For building St. Peter's School Church. Rev. Latimer Jones, Vicarage.

For completing a gap in a wall about 10,000 yards. Johnson and Raper, solicitors, Chichester.

ANGLESEY UNION.—July 6.—For the erection of new workhouse, infirmaries, &c. Plans, &c., Mr. R. G. Thomas Menai Bridge.

BLACKHEATH.—For the erection of two semi-detached villas at the Manorway. Mr. Moreing, 11, Carlton street, Waterloo place.

STOGURSEY, NEAR BRIDGEWATER.—June 29.—For the erection of a vicarage house. Mr. J. Norton, architect, 24, Old Bond-street, W.

GRAVESEND.—June 25.—For certain alterations and additions to Christchurch schools. Messrs. Parr and Strong, architects, 25, College hill, E.C.

BROMLEY-BY-BOW.—July 10.—For the erection of a chapel in Devon's-road. Messrs. Hovenden and Heath, 181, Bishopsgate street Without.

June 30.—For the erection of a country residence. J. P. Spencer, architect, Wantage.

HURSTPIERPOINT, SUSSEX.—July 7.—For the erection of national schools. Messrs. Goulty and Gibbins, architects, 12, Union-street, Ship-street, Brighton, and 40, Torrington square, London.

HERBERT HOSPITAL, WOOLWICH.—June 26.—For repairing and keeping in order the waterclosets, &c. J. W. Sherman, Purveyor's office.

METROPOLITAN BOARD OF WORKS.—July 4.—For draining, forming paths, mounds, &c., in Finsbury Park. J. Pollard, clerk to the Board of Works, Spring Gardens.

BROOMFIELD.—July 14.—For the erection of the new church of St. Mark, Broomfield, Sheffield. W. H. Crossley, architect, 21, Park-square, Leeds.

ASTON UNION.—For erection of new workhouse at Erdington. Mr. G. Thomason, architect, Wellington chambers, Bennett's hill, Birmingham.

HEREFORD.—July 11.—For taking down and rebuilding St. Andrew's Church. Architect, Mr. J. Johnson, 35, Moorgate street, E.C.

DARLINGTON.—June 22.—For various works in the construction of new roads, drains, &c., for his grace the Duke of Cleveland. J. Ross, architect, Darlington.

NEWCASTLE-ON-TYNE.—June 22.—For the several branches of the works required in the erection of a wool warehouse, hide mart, &c. John Wardle, architect, 7, Higham-place, Newcastle-on Tyne.

MORPETH.—June 24.—For the whole or any part of the works required in taking down and rebuilding the Townhall. Messrs. Austin and Johnson's offices, New Bridge-street, Newcastle upon-Tyne.

NEWCASTLE-ON-TYNE.—June 29.—For erection of a new drill shed. Thomas Oliver, F R I.B.A., architect.

LICHFIELD.—June 23.—For the enlarging and altering Christ Church Parsonage. Mr. T. H. Rushworth, Carlton Chambers, Regent street, London.

LAMBETH.—June 26.—For supplying and laying dressed kerb and rubbed York paving. T. Roffey, vestry clerk, vestry hall, Kennington-green.

PROPERTY SALES.

JUNE 8.

AT THE MART.—By Mr. Gausden.—Leasehold 12 houses, Nos. 8 to 13, York buildings, and Nos. 13 to 15, Churchway, St. Pancras, term 41 years from 1841, at £4 17s. per annum, and underleased for the whole term at £78 12s. per annum—sold for £380.

By Messrs. Bromley, Son, and Kelday.—Freehold residence, known as Elm Cottage, Kirkdale road, Leytonstone—£200.

By Messrs. Beningfield and Chetwood.—Freehold 11a. 3r. 27p. of arable and pasture land, forming part of Mackhouse Farm, in the parish of Ware, Herts—£930.

Freehold the remaining portion of Mackhouse Farm, comprising the homestead, three cottages, buddings, and 4a. 1r. 15p. of meadow land, situate as above—£2,000.

Freehold pleasure farm, known as Millett's, situate 1¼ mile from Ware, Herts, comprising homestead, two cottages, buildings, and 22a 0r. 15p. of arable and pasture land—£470.

Freehold brickfield, known as Harris Field, Ware, Herts, containing 11a. 0r. 1p.—£160.

JUNE 9.

AT THE MART.—By Messrs. Debenham, Tewson, and Farmer.—Freehold residence, No. 22, Fairlawn villas, Merton road, annual value £50—£750.

Freehold two houses, Nos. 4 and 5, Star and Garter yard, St. George street, E., producing £14 6s. per annum—£105.

By Messrs. Scobell and Jenkinson.—Leasehold two houses, Nos. 1 and 2, York villas, Wingmore road, Loughborough Park, producing £66 per annum, term 99 years, from 1866, at £9 per annum—£550.

Leasehold two residences, Nos. 63 and 65, Cornwall road, Westbourne Park, producing £135 per annum, term 91 years unexpired, at £26 per annum—£1,490.

By Messrs. St. Quintin and Notley.—Leasehold house and shop, No. 72, Baker street, Portman square, let on lease at £105 per annum, term 4 years unexpired, at £6 per annum—£290.

Leasehold house, stabling, and premises, No. 50, George street, Portman square, let on lease at £128 per annum, term 4 years unexpired, at £8 8s. per annum—£400.

Leasehold house and shop, with stabling and premises in the rear, No. 51, George street, producing £120 per annum, term 4 years unexpired, at £7 7s. per annum—£470.

Leasehold house, No. 16, Manchester street, Manchester square, let on lease at £96 16s. per annum, term 20 years unexpired, at £11 per annum—£1,050.

By Mr. T. R. Meakin.—Leasehold residence, No. 8, Edith villas, North end, Fulham, annual value £65, term 72¾ years from 1850, at £4 17s. per annum—£505.

By Mr. Joseph Salter.—Leasehold house, No. 119, Leighton road, Kentish Town, let at £33 per annum, term 89 years from 1851, at £5 5s. per annum—£310.

Leasehold residence, No. 121, Leighton road, let at £32 per annum, term same as above, at £5 per annum—£310.

Leasehold residence, No. 1.3, Leighton road, let at £86 per annum, term same as above, at £5 5s. per annum—£120.

Leasehold house, No. 11, Hammond street, Islip street, Kentish Town, annual value £28, term 90 years from 1859, at £5 per annum—£875.

Leasehold two residences, Nos. 27 and 29, Prince of Wales road, annual value £46 each, term 80 years unexpired at £7 7s. each per annum—£8.5.

JUNE 10.

AT THE MART.—By Messrs. D. Smith, Son, and Oakley.—Leasehold five residences, Nos. 1 to 5, Kidbrooke Park road, Kent, term 97 years unexpired, at £13 each per annum—£4,900.

By Messrs. Edwin Fox and Bousfield.—Freehold residence No. 7, Blenheim villas, Abbey road, St. John's wood, let at £50 per annum—£810.

Freehold residence with stabling, known as Guildford Lodge, Lower Grosvenor place, Margate, Kent—£1,065.

Leasehold residence, known as Bruce House, No. 37, Highbury New Park, annual value £120, term 82 years unexpired, at £15 per annum—£1,350.

AT THE GUILDHALL COFFEE-HOUSE.—By Messrs. Furber and Price.—Freehold house, No. 5, Boyle street, Saville row, Westminster—£1,050.

The chattel interest in the leasehold stabling and premises known as Umcorn yard, Ossulston street, Somers Town, annual value £200, term 29¾ years unexpired, at £27 per annum—£420.

The chattel interest in the premises behind Nos. 34 and 35, Ossulston street, Somers Town, annual value £90, term 12 years unexpired, at £24 per annum—£100.

Leasehold house, No. 9, Raddington road, Westbourne Park, let at £36 per annum, term 95 years unexpired, at £7 per annum—£320.

Leasehold two houses, Nos. 3 and 4, Raddington road, let at £36 per annum each, term 95 years unexpired, at £14 per annum, subject to a mortgage of £320—£130.

Leasehold three houses, Nos. 5, 7, and 9, Raddington road, producing £38 each per annum, term similar to above, at £7 each per annum—£1,020.

Leasehold two houses, Nos. 1 and 2, Blagrove road, Raddington road, let at £36 each per annum, term similar to above, at £7 each per annum—£640.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

David Dunham, Toddington, near Dunstable, builder, July 1, at 2.—Edward Etheridge, Horsham, builder, June 24, at 1.—William Fenn, Woolwich, carpenter, June 29, at 12.—Simeon Jones, St. James's-street, house-decorator, June 27, at 11.—Robert Marrable, Forest-hill, builder, June 25, at 12.—William Price, Clarence road, Bow, timber merchant, June 24, at 2.

TO SURRENDER IN THE COUNTRY.

John Henry Docton, Padstow, builder, June 9, at 10.—Edward Evans, Geascoed, timber carrier, June 80, at 11.—William Richard Simpson, Chester, plumber, June 80, at 12.—William Booth, Hartlepool, builder, June 29, at 11.—Henry Hickman, Sedgley, Staffordshire, timber dealer, June 18, at 12.—James Lee, Balsall Heath, builder, July 3, at 10.—Sophus Frederick Mathias Lindhard, Hartlepool, timber merchant.—John Fulshaw Lupton, Leeds, painter, June 22, at 12.—George Patrick Rooney, Birkenhead, builder, June 25, at 11.

THE BUILDING NEWS.

LONDON, FRIDAY, JUNE 26, 1868.

THE ARCHITECTURAL EXHIBITION, CONDUIT-STREET.

FOURTH AND CONCLUDING NOTICE.

THE domestic buildings, for which designs are here exhibited, are not exclusively confined to the Gothic style, like those for ecclesiastical purposes which we have already reviewed. The hanging committee have, however, so judiciously grouped those of the same classes together that we cannot do better than take the subjects much as arranged by them. In design for coachman's cottage (Nos. 62 and 70), recently erected for J. J. Tufnell, Esq., at Langleys, Great Waltham, Essex, Frederic Chancellor, architect, we have a really well-studied brick building, with upper part of timber construction, and tiled roofs. Such a work is quite refreshing. No. 71 is a perspective view of a proposed country house, by Thomas Harris, architect, which is such a jumble of queer detail, and so badly composed, that we trust it may proceed no further than a proposition. No. 65 (Eldon Lodge, Victoria-road, Kensington, with studio and recent additions made, for Edward Henry Corbould, Esq.), by Thomas Henry Watson, architect. Doubtless the designer was much cramped by the original building, and is not altogether answerable for the very modern Gothic style of the building, with its ugly, though ordinary, drop-handle labels to the windows; but why he should have taken the trouble to make a drawing of it, or, having done so, should have exhibited it, we are at a loss to conceive. No. 61 (house erecting at Ashford-Carbonnel, Shropshire, Henry Curzon, architect) is a plain Elizabethan building, the only special feature in which is a circular bay window, which would have been preferable had it stopped below the roof; the manner in which it is carried up as a dormer being objectionable in our opinion. No. 69 ("Design for baths and washhouses, which obtained Sir Francis Scott's prize, Royal Institute of Architects' Competition"), by Ernest C. Lee, is clever, and has many points of merit, but is of too exaggerated an Early French type, and has too great an abundance of great round holes and stumpy features, such as couplet windows of the prevalent all-head and no body style No 64 (design submitted in competition for proposed new club at York, by Goldie and Child, is altogether unworthy of its authors, and too much in harmony with the pseudo-Gothic bridge in the foreground. No. 72 is a drawing of the banking house for the General Credit and Discount Company, Lothbury, City, by G. Somers Clarke. It does not do justice to the building, which is one of mark, and for which we are thankful, as a relief from the usual vulgarity of the City buildings. As may be better seen by the photographs 391, 393, and 394 than by the drawing, it is a delicate—almost too delicate—version of Venetian Gothic. We like particularly its bold chimneys, but deplore the manner in which the upper square-headed windows run up into the cornice, and protest against the elongated granite bosses with which it is freely studded as carrying to excess a style of ornament with which we were already satiated in its milder forms. No 73 is a very simple block of model dwellings in course of erection at Fulham for the Bishop of London, with a single entrance in front leading to balconies in the rear; and No. 68 is designs for cottages, &c., in Oxfordshire, for Lord Dillon, of the same class, by John P. Seddon, architect. Mr. Murray also exhibits "improved industrial dwellings" at the Mall, Kensington (No. 86), the interior arrangements of which afford a greater boon to the class intended for its occupants than the exterior does to the gaze of the public, the building having rather the look of a warehouse, which is due mainly, we think, to the treatment of the open staircases. No. 77 (Humewood, County Wicklow, in the course of being rebuilt for W. W. Fitzwilliam Dick, Esq., M.P.), by William White, architect, is an important work which deserves attention. Study enough of a sort has been given to it, and the arrangements are sufficiently convenient. It is a "gentleman's house" contrived on true mediæval principles, in which every room seems to have been placed just as and where it was wanted, without consideration for the rest, or, at any rate, without proper fusion of the whole, and in defiance of symmetry and even composition and grouping. The external result is a thorough jumble, rendered worse by a redundance and affectation of Irish features, such as stepped gables and battlements, which are quaint enough when capping massive abbey towers, but are out of place when running up and down at their own sweet will alike over gables and dormers, bay-windows and porches, leaving no rest anywhere. There are many features, also, to which we are obliged to object, such as a heavy angular turret springing with too sudden corbelling out of an insignificant dwarf-pier, and light wooden oriel windows growing out of heavy stone corbelled tablings, capable of supporting ten times such trifling weights. No. 78 (North-west view of Dromore Castle, Co. Limerick, now being built for the Earl of Limerick), Messrs. Godwin and Crisp, architects, is more picturesque and far quieter than the last mentioned. It exhibits many of the same national features, but more temperately and on a grander scale, and it is more in keeping throughout in the general character and scale of its windows and other openings. It is, however, so mediæval that, when the Fenian frenzy has passed away, it will, we fear, be found rather unsuitable to modern requirements, and become looked upon as quite as great a curiosity as the more venerable castles of the county. Four other drawings are exhibited by the same firm, and, like all that emanates from the able pencil of Mr. Godwin, are worthy of note, but they leave us in curious uncertainty as to what architectural flag he intends to serve under. They are rather clever antiquarian studies than designs such as we should look for from one of the leading architects of the nineteenth century. No. 78* is a gateway about to be erected for the Marquis of Northampton, at Castle Ashby, and is a delicately treated and refined specimen of the "pestilent" Renaissance style, and we rubbed our eyes and looked again before we could believe its authorship, particularly as it presents some of the least excusable features of the style in its flanking scroll brackets. Then Nos. 80, 81, and 82 show us the three premiated designs by this firm for the first competition for the Bristol Assize Courts. While we heartily regret the untoward result by which the Town Council threw away the opportunity of having municipal buildings of which it might be proud at their hands, we can hardly wonder at their declining to erect such a stern-looking fortress as the first of these, which looks as if it had stepped out of Lombardy, and for which "Ten hundred and sixty-six" was a motto suitable enough; and, tempered by the colouring and associations of the intervening autumns, we should have hailed it with glee had we met it when on a sketching tour; but, as the worthy burghers are not anticipating a raid from the citizens of Gloucester, and have quite lost the costume and mincing gait of the figures that M. Viollet le Duc delights to draw, we incline rather to the second design, which savours more of a peaceful age, the outline of which is better, and the ornamental detail well concentrated. We should ourselves perhaps quarrel a little with it as being of too late a type of work, and too much after the character of the Rouen townhall, for Bristol.

Happy, however, we could ourselves have rested with either, had not we been further distracted by the *embarras des richesses* before us, for design No. 3 carries us back to the primæval days of Gothic architecture, and gives us three grand couplet windows finely grouped, but nothing else, if we except just enough of a sculptured frieze to whet one's appetite for art, and put us in a rage that it has been broken up into bits because some ancient precedents exist for such a practice in either some clumsily designed old buildings or others that have been tampered with. We had thought that the miserable result of the similarly treated paintings in the Union at Oxford would have been the first and the last realisation of such patchwork, since Mr. Woodward, fortunately for himself, was not allowed to perpetrate his intention of so decorating the Foreign Office. Then why, with relieving arches over these couplets fit to bear tons of masonry, have they no load at all? The whole design is weakened by the range of trivial little openings above them. Then why is this central feature recessed, while the comparatively uninteresting and irregular flanking masses are pushed forward to its detriment? and what is the use of the complicated group of shafts dividing the simple two-light openings of these wings, while lintels and jambs are perfectly unmoulded? And, as we are in a questioning mood, let us ask, lastly, why, with such a bill of fare before us to choose from, are the dishes all French, a fashion which we think would be more honoured in the breach than the observance in such a case?

Mr. Robert W. Edis exhibits No. 83, a new warehouse in Addle-street, City, the windows of the ground and second floors of which are semicircular headed, while those of the first and second floors have lintels, an arrangement for which we see no reason but caprice. Still the design shows an effort to treat architecturally an ordinary class of buildings, which we do not recognise in his new houses, Queensborough-terrace, Bayswater (No. 90), which we should not have suspected to have emanated from the office of an architect at all.

No. 84 (the Oriental Hotel, Cairo), by C. G. Wray, is a tolerably simple and successful work, with plenty of shadow. The treatment of the pediment and cornice, in the centre broken into as that last described, is open to the same objection. A fairly commendable work, by an English architect abroad, is No. 88 (design for quadrangle, Nice), by T. T. Smith, with some delicate external polychromy. So, also, on the whole, is No. 392 (Government House, near Poona), by Messrs. Trubshawe and T. R. Smith. No. 158 (the City Offices Company in Lombard-street), F. and H. Francis, architects, is one of those overdone buildings in which the main object seems to have been to spend as much money as possible. We really cannot find one word to say in its favour; usually one row of garnishing pots is considered sufficient, but here, besides that which mars the skyline, another surmounts the order to the first floor. Bad details are applied in profusion, like butter upon bacon, in the vain hope of producing a startling effect.

No. 210 (terrace, with proposed hotel at Saltburn), by George and Vaughan, architects, is a work of much originality, simplicity, and merit. We wish we could say as much for the pretentious design for Proprietary College, Birkenhead, David Walker, architect; or for the proposed Cheshunt College, Messrs. Landers and Bedells, architects, both of which are indifferent buildings. In No. 50 (Sanatorium, Harrow) we have passed over a picturesque and satisfactory building by Mr. C. F. Hayward. Drawing No. 400 shows the first design for the decoration of the Queen's Theatre, suggested by Mr. Albert Moore (Charles Phipps, architect), and has certainly the merit of being subsidiary to the beautiful

painting by that artist on the proscenium, much as that tattooed on the limbs of a red Indian would be to the natural expression of his countenance; but we cannot really wonder at or lay great blame on the manager who declined a style of decoration so very remote from the predilections of his probable audiences. We admit that architects and artists alike have to teach the public rather than try to please them, but they will teach better if they can contrive to please somewhat as well. We have carefully examined this drawing, and do not see that the scheme of colouring can have been materially altered, and it is delicate and refined enough, in pleasant contrast to the mustardy yellows and raw reds and blues of Prince Napoleon's glaring mansion, and for the purpose to the more sombre tones of Monsieur Lameire's church decorations. Painters and architects need greater experience in working together than they have had, and the sad result of their failure in this case to hit the right and acceptable thing is unfortunate, as the picture in the theatre is utterly ruined by its surroundings, and a great opportunity has been lost. It is not for us to lay the blame on anyone. We only point out as a principle that to ensure success they must work in harmony, as it does not quite do to be told, as we have been ourselves by an artist, that to bring out his picture a whole interior should be painted black.

WALWORTH COMMON ESTATE.

A FEW months ago the Guardians of St. Mary, Newington, Surrey, advertised for plans for laying out Walworth Common Estate. They have received in answer about twenty-three designs, which were privately exhibited last week in the Walworth Vestry Hall. It is seldom that a more important problem is presented to architects than the laying out of a large district in the neighbourhood of the metropolis; and we propose to offer a few remarks upon the way in which it is grappled with in this instance by the competitors. The estate in question is bounded on the west side by Walworth-road; on the north by Walworth Common, John-street, and Prince's-lane; and on the south and east it extends nearly to Albany-road and the Old Kent-road. It is at present occupied by the most wretched class of houses; in fact, there scarcely seems one on the whole estate worthy of preservation. In their instructions, the Guardians require two good roads to run through the estate, east and west, and most of the houses to range from £28 to £45 annual rental.

In laying out such an estate as this, the chief points seem to be—first, to provide good and convenient access between the main thoroughfares from each side, which would be furnished by the two roads demanded by the instructions; and secondly, to lay it out in the most suitable manner for the class of people who will probably tenant it. The numerous railroads round the metropolis are rapidly tending to divide the town into separate districts. The central parts become the great shop and office of the community—the great heart which receives and gives out its flow of population every morning and evening. The great majority of those who can afford it live in the suburbs. The districts between the more central parts and the suburbs proper appear most suitable for the lower ranks of the middle classes and for the poor, and those whose places of work being sometimes in one neighbourhood and sometimes in another are obliged to occupy as central a position as possible. Now this estate is just one of these districts. It is not likely to be tenanted by those who can afford to give £50 or £60 a year and upwards in annual rental, except in the case of shops along the main roads. The estate is close by the Metropolitan Extension Railway, which runs through the beautiful suburbs of Clapham and Brixton; and those whose circumstances will permit them will most certainly choose these places in preference to Walworth, especially as the season tickets to Victoria and Ludgate Hill stations are the same from each place. We may consider it pretty certain that the estate will be occupied by shopkeepers, the lower ranks of the middle class, and the poor. If houses at a rental of from £50 to £100 a year are built, they will, as in other parts of London, be taken by speculative lodging-house keepers, who will perhaps let them out to some nine or ten families in each house. Now it should be the duty of the competitors to consider these circumstances beforehand, and arrange for houses which are designed to be let in flats, so that each flat could have the conveniences of a small house. The estate should be separated into districts; the main roads should have shops (which would let at a good rental), houses designed to be let in flats for the middle classes, and small houses for clerks, &c., and the back streets should be appropriated to the poor; model lodging-houses should be provided; and the houses in these streets should be so designed that a poor man could obtain one or two or three rooms with conveniences specially designed for an occupant of his means, and not be stuffed with his family into a parlour or drawing-room, where all the cooking and so forth must be done in rooms designed for a totally different purpose. Another important point to be studied in a case like this is the greatest possible economy of space consistent with light, air, and sanitary arrangements; houses of the same class should have the same amount of air space around them.

Now let us turn to the plans. What do we see? With very few exceptions almost every point mentioned above is neglected. The estate is shown laid out in a manner suitable to the Isle of Wight or Brighton. Long rows of villas are provided, such as would be taken by those whose incomes vary from £500 to £1,000 a year. In almost all the plans there is very little difference shown in the sizes and character of the houses all over the estate. There is a prodigal waste of space; roads are turned and twisted about as if land in London was worth nothing; some houses are provided with plots of ground 150ft. long; others of the same size must be content with about 50ft.; while the style and size of the houses generally shown on the elevations are much too pretentious for such an estate.

The plans are so much alike in most of these particulars that we do not intend to make any lengthy remarks upon each. There seems to have been some misunderstanding about the amount of ground belonging to the workhouse. Some of the competitors have found room for forty or fifty houses where others have shown only workhouse property; one or two of them have entirely ignored the Guardians' instructions by carrying a road completely through the workhouse buildings; others do not preserve the right of way now enjoyed by the houses on the south side of Boundary-lane. One of the competitors has shown remarkable ingenuity in the "get-up" of his plans; his large plan folds up with hinges like a folding shutter, and he evidently has an idea that a remembrance of Abyssinia will take, as we have on his plans "Robert Napier-road," "Senafe-road," "Magdala-road," &c. There are not so many bird's-eye views as we should have expected to see in days when pretty pictures are the most likely things to win in architectural competitions; there are, however, two or three. One is particularly clever, as an artistic view, from the shadow which separates Walworth Common Estate from the surrounding property. We shall be rather curious to hear the decision in this competition. Will the bird's-eye perspectives or the coloured views of mimic Regent-streets win the day? Very few of the plans seem to be a really satisfactory solution of how to lay out to the best practical advantage such a valuable piece of ground as Walworth Common Estate.

THE SCULPTURAL ORNAMENTATION OF THE THAMES EMBANKMENT.

OUR attention has been drawn to this subject by a departure from all State precedent so remarkable as really to promise a success in that apparently to us most difficult of all arts—ornamental sculpture. It is not probable that the Thames Embankment will become the site of the new Law Courts; still it cannot be supposed that such a river frontage will be left in association with the mean intervals of dusky brick and mortar that occur between Waterloo and Blackfriars bridges; and hence the necessity of such a finish of the quay as shall not be put to shame by any buildings that may hereafter be erected in the course of the old water line. The public feeling with regard to what is called improvement is represented by the remarks of certain members of both Houses of Parliament, when they express a desire for utility and convenience rather than beauty in public buildings. In the expenditure of the seventy-six millions sterling which the reconstruction of Paris thus far has cost, embellishment alone has been contemplated; whereas in our own case utility has been the predominant consideration in all matters of Government enterprise. Exterior effect has been too lightly considered, although symmetrical and graceful ornament is not more costly than commonplace and inharmonious decoration. The Thames Embankment has been pronounced a signal opportunity for the display of a redeeming taste in open air embellishment, but our antecedents in this direction have so far schooled us in resignation as to leave little hope of amendment without an entire change of system. Perhaps in this the initiative will be taken on the Thames Embankment, where a short time since there appeared on one of the pedestals an erection intended to represent a lamp pillar. The sketch, for such it was, showed a central shaft, round which were clinging two boys, the higher of whom holds a torch, with which he is about to light the lamp above, while the lower of the two supports and lifts him on his shoulders. A model of the subject, worked out in the round, half, or one-third the size of the intended pillar, was submitted with others to the Board of Works, and was selected from those by which it was accompanied. The exertion and energy of the figures are admirably described, and they compose with the shaft in a manner so successful as to present in every view an effective system of lines and quantities. The projectors of such a study require the figures to be lighter than the fleshy cherubs of Rubens and Murillo, and to move with a grace superior to those of Correggio, because in their movement there is an immediate purpose, of the accomplishment of which we should despair if the boys were less agile. The modelling is accurate, so that the play of muscle corresponds with the action. The figures are not merely supplementary—the idea is extremely happy as applied to a pillar for supporting a light. Wherever the shaft is seen it shows a course of spirals so arranged as to assist the idea of ascent. Whatever interpretation the artist himself may give to his design, he furnishes, on a small panel below the figures, a key to his intention in a neat configuration of the caduceus and the trident. These may be received as merely complementary, and the upward striving of the boys may be read literally, as their intention is sufficiently obvious. Or, accepting the trident and the caduceus as symbolical of power and commerce, the energy and determination of the figures may typify those national attributes, to which our country is indebted for its eminence among the nations. As the composition has been maturely studied all round, we may suppose that the shafts will alternately show different fronts. The lion's head on the pedestal is, when closely examined, admirably designed, but there has been some mistake in its original adaptation

to the pedestal. The ring in the mouth suggests its having been placed there as a means of mooring barges and boats; but a crowd of carrying craft would be a most unseemly garniture to such a river terrace as we hope to see there. Thus, in order to prevent the rings being so employed, a circular groove has been cut, and they have been sunk and fixed in the granite. For the vacant pedestals nothing has as yet been determined. The large one is, of course, prepared to support a colossal aggroupment, and we scarcely know how the artist, whoever he may be, will escape allegory—that very trying class of subject which always leaves the sculptor in uncertainty as to whether his conceptions have in them more of the sublime or the ridiculous. Those grave and mystical personages that represent the cities of France in the space once known as the Place Louis XV. cost the French committee of taste some trouble, and the impersonations do not now all respond gratefully to the pains that have been taken with them. If, however, in the selection of our own public monuments the French system were adopted, we should have less reason to be ashamed of those that we should erect according to such rules than of those which we have already set up, it may be said, without any rule of judgment. In questions of public sculpture in Paris, the commissions for models are given directly to those sculptors who may have distinguished themselves in the particular line of which it is desired to have an example. If the design or model be not satisfactory to the judges it is paid for and destroyed, and another sculptor is applied to; and this method is followed until a work of the required standard be produced. It may be said that there is ample room for improvement in lamp-posts, but it would have been difficult to meet with anything more beautifully appropriate than the conception described and the manner in which it is carried out—the idea is worthy of Gean Bologna.

ZINC AS A CONSTRUCTIVE MATERIAL.—I.

MOST of our readers are probably familiar with zinc as a material for the covering of roofs, for cisterns, gutters, pipes, and a variety of other useful purposes which we shall briefly direct their attention to in this and the following articles. But many of our readers may not be aware that zinc has been used to replace its sister metal in the sheathing of ships, and, were certain difficulties once thoroughly surmounted, that which has hitherto been an expensive operation, would become, comparatively speaking, a cheap and economical one. To properly fulfil certain conditions, and to be adapted to particular types of construction, a material must be endowed with peculiar properties. It may not possess them to a maximum; it may demand the skill of the engineer and the architect, and the care and ability of the manufacturer and contractor, to improve and develope them, and from the raw material to finally turn out a useful and valuable article. But the greatest skill and the most unremitting perseverance will fail to render a substance suitable for certain duties if it does not possess *per se* some inherent qualities congenial to the task that will be imposed upon it. The natural characteristics of zinc as a metal are well known, and we shall therefore dismiss this portion of our subject by remarking that it is found associated with lead ores in the state of a sulphuret and a carbonate, the latter being the most productive ore, usually termed calamine. Pure zinc tarnishes in the air very slowly; its specific gravity is about 7.00, and under ordinary circumstances it is of a brittle consistency. With a rise of temperature it becomes malleable, and at a heat of 260 deg. Fah., it may be hammered or rolled with facility and safety. A peculiar property it possesses, and which renders it well adapted for the purposes under consideration, is that after once being subjected to the process of rolling or hammering, it retains its malleability ever afterwards.

Reversing the ordinary method of algebraical and mathematical reasoning, which proceeds from the known to the unknown, we shall commence with the application of zinc to the sheathing of ships, as that subject is less trite than the others we have alluded to. Previously to the employment of copper, wooden vessels were bottomed or sheathed with sawn planks steeped in pitch, and frequently covered with large-headed nails or spikes. This primitive description of sheathing was intended to preserve the keel and hull against the attack of worms, but, however well it might have answered this purpose, it altogether failed to prevent the adherence of barnacles and rapid growth of marine vegetation, which in a few weeks seriously impeded the speed of the ship. Copper sheathing was first introduced about the year 1760, and was applied to an English frigate "The Alarm." Since that period its use has been general with all wooden ships. From twenty-six to twenty-nine shillings per ton may be taken as a fair average sum that the coppering of a vessel will come to. The duration of copper sheathing is very limited. In the French navy the men-of-war only last about five years, and they are sheathed with what is known as red copper, while the bottoms of the ships in the mercantile fleets, which are of yellow copper and thinner than those of their warlike neighbours, scarcely last beyond three years. The temperature of the waters in which they generally sail has a marked effect upon their powers of endurance. Vessels despatched to the China Station, the coast of Africa, or for a lengthened cruise in the warm Indian seas, require to be fresh coppered after a stay there of a couple of years. Sea water is a solvent of copper, and it is by reason of the solubility of the material that it is not covered with vegetation. The whole process is both curious and instructive. Directly a morsel of a marine plant, or of any shell or mollusc, is deposited upon the sheathing, the pellicle to which it is attached becomes separated by the act of solution and is carried away by the current. The truth of this is fully corroborated by the fact that a copper bottom is rapidly covered by enormous incrustations, equally quickly as one of iron or wood, if its dissolution be prevented, as was the case when a trial was made of "Davy's preservers." That distinguished chemist had remarked that when two metals in contact with one another were plunged into salt water an electrical current was at once set up, and that the electro-negative metal was rapidly oxidised, while the electro-positive was preserved intact. He, therefore, justly argued that to prevent the dissolution of the copper sheathing all that was required was to attach to the keel of the ship pieces of any metal electro-negative with respect to copper. This was accordingly done, and cast-iron pigs, denominated "preservers," were attached to the keel. These were soon oxidised, while the copper remained sound and undissolved, and so far the success of the "preservers" was undoubted. But, unfortunately, although the copper had ceased to dissolve, it continued to foul, and in a short time became covered with barnacles and the products of marine vegetation to so serious an extent as to lead to the abandonment of the "preservers." Of two evils one is bound to choose the least, and the gradual dissolution of the sheathing was accepted in the English navy as an inevitable necessity and of less moment than the growth of incrustations, which seriously interfered with the actual progress of the vessel at sea, besides being attended with numerous other grave disadvantages. The armour-plated ships of war of the French navy present a remarkable proof of the electrical action noticed above. With very few exceptions these vessels are constructed of wood and are copper bottomed, but their armour plates descend about seven feet below water line, are in contact with the copper, and act precisely as one of "Davy's preservers." Consequently, although the sheathing is not dissolved, the bottom becomes covered with confervæ and molluscs with incredible rapidity, and the iron plates are corroded and placed *hors de service* in a space of time equally short. It is easy to perceive in this case that the iron is the electro-negative and the copper the electro-positive agent.

Both the commercial and inventive spirit of individuals were concerned in the important question relating to the great expense incurred in copper bottoming timber ships, and from time to time attempts have been made to substitute another and a cheaper metal for the purpose. Zinc was accordingly tried, but when this metal, attached to a timber keel, is exposed to the action of salt water, it forms insoluble compounds, which adhere to the surface and manifestly form a nucleus for future incrustations and the growth of plants, which quickly develope themselves. For this reason zinc applied to timber ships has proved a failure and been practically abandoned, and we have now to consider its application to the last triumph of naval architecture—in the case of iron vessels. So long as iron, whether dull or polished, is permanently immersed in pure salt water it undergoes no change, but if it be exposed to the action of a damp atmosphere it rusts or oxidises rapidly. The hulls of iron vessels, which undergo alternate submersion and emersion, accordingly as the ship is loading or unloading, and which, moreover, remain frequently for a considerable length of time in harbours and roadsteads, the waters of which are abundantly charged with organic matters, are subjected to a quick oxidisation. As a result, an insoluble compound is formed which adheres to the iron plates, and is highly conducive to the old evil, the growth of plants and incrustations. All the methods hitherto tried to prevent the formation of these impedimenta upon iron vessels have failed either partially or altogether. Many descriptions of paint, mineral coatings, and thin layers of various substances have been employed, and have been so far successful as in some instances to prevent the iron rusting, but they have all the disadvantage of giving rise to the production of insoluble deposits, which, in spite of their poisonous qualities, have no terrors for confervæ, barnacles, and molluscs. In our next we shall describe the method proposed for the application of zinc to the sheathing of ships, and then pass on to the consideration of the other uses that may be made of this valuable and economical material.

A NEW PROFESSIONAL DIRECTORY.*

WE have here the first classified list of the members of those professions and trades which are connected with the arts of construction, together with their institutions and charities, and the various public bodies and official personages with which they are brought into contact. It is true that it cannot possess the authority of the lists and directories of those professions which are under strict legal regulations, so that a reference to them will show the professional status of a particular member; but for most of the purposes for which a trade directory is required in daily business, this work does for Great Britain what each ordinary directory does for its own locality. Turning over the leaves of the handsome-looking volume, and noting the great variety of interests grouped round the two leading professions, it seems surprising that, as a mere matter of convenience, this task has not been undertaken before, and, in view of the difficulties which

* "The Architects', Engineers', and Building Trades' Directory." A business book of reference for the various industries connected with the arts of construction throughout England, Scotland, and Wales. London: Wyman and Sons. 1868.

must have attended it, the projectors may fairly claim the consideration which they ask for their experimental volume.

In the six divisions of the work we find, first, a list of the societies, institutions, and charities connected with art, archæology, and construction, with details of their constitution and objects. Then follow separate directories of architects, engineers, surveyors, sculptors, &c., with "a concise record of the salient facts" in the professional career of each individual. The third division contains a classified directory of the trades connected with building; the fourth consists of separate trades' directories for each town in England, Scotland, and Wales; the fifth furnishes particulars of the patents relating to construction granted during 1867. Of the sixth division, which is composed of the ordinary trades' advertisements, we would only remark that several which are absent from it are a great deal too conspicuous by their presence in those quiet spots which ought to exist between the other divisions of the work, which they not only disfigure but confuse. Some additional heads of information might with advantage have been added, such as lists of the county surveyors, the diocesan architects, and the members of the local architectural societies. There is besides a large section of the architectural profession to whom a few special particulars of the Diocesan Church Building Societies would have been welcome. Amongst errors in arrangement we note that the bye-laws of the Metropolitan Board of Works are given as if in force in the City of London only, while the standing orders of the City Sewers Commission are made to apply to the whole metropolis. The frequent repetition of names and addresses is a hindrance to the usefulness of the book, and adds very considerably to its bulk. For instance, in the London trades, the name and address of one firm are repeated some thirty times. It appears successively under boilermakers, bolt and rivet makers, brasslounders, brick and tile machine makers, brickmakers, and so on to the end of the list, the said firm being all the while, as far as we know, simply an agency for all of these various trades. The same evil is equally apparent in the general list of towns. Taking quite at random one of the first, Berkhampstead, we find that out of the seventeen addresses classified under eight trades, one man's name and address are repeated five times and another's twice. Surely some distinguishing mark might have been affixed to these names where they first occur, denoting that they also belonged to other trades. A large amount of space might thus have been saved. Very misleading, too, is the plan, or rather want of plan, adopted in the list of towns. Some large suburban districts, such as Limehouse, Millwall, &c., are incorporated with the London list, while others, such as Hackney, Tottenham, and Barking, are given separately. We find it, too, seriously stated that Hackney, with a given population of 76,687, possesses only two builders and *one* carpenter, this one carpenter being also one of the two builders. We know some of the streets of Hackney, and we can hardly trust this statement as correct. Woolwich is equally unfortunate with Hackney, only one carpenter residing there.

With regard to one feature of this arrangement, to which the projectors attach considerable importance, they hardly do themselves full justice. In undertaking to furnish a list of the professional achievements of living architects and engineers, they are surely not following any precedent to be found in other class directories, but rather striking out a new line of their own, and they might on that account have claimed credit for any advantages which the plan may possess. At any rate, so far as these professions are concerned, the scheme has sufficient novelty to justify a particular examination of it. A complete list of the work of each individual would have considerable value for purposes of reference, though most persons would find it rather tiresome reading. A careful selection of the principal or typical works of each would also have its uses, for it would give some idea of the kind of experience which each might possess. To make it perfect, however, it would need to be firmly and impartially written, for unless cognisance were taken of those achievements which are on the wrong side of mediocrity, the comparison would be rather in favour of those who are least deserving. As it could not reasonably be expected that either of these schemes would be carried into practice, it was proposed to let each person tell his own story in his own way, and a series of such accounts would undeniably be the most lively reading of all, but the necessity which existed for conciseness has evidently interfered with the simplicity of the scheme. A set phraseology has been applied to the whole of the accounts, which, however necessary in many cases, frequently conveys impressions that could not have been intended by the autobiographers. Thus, in numerous instances, where a list of works is appended to a name, it will include not only those which he designed and superintended, but such as may have fallen into his hands to complete or alter, or perhaps to carry out. Scarisbrick Hall, which was recently illustrated in this journal as a work of the late Mr. Pugin, is here said to be comprised in the works of his son. In like manner the engineer to the Metropolitan Board of Works is said to have *planned* the main drainage of London, *introduced* subways for carrying gas, water, and other pipes, and *designed* the new street from Blackfriars Bridge to the Mansion House; the first of these works having really been planned by his predecessor, the late Mr. Frank Foster, who afterwards reported upon it in conjunction with the engineer to the City Sewers commission. The competition for designs for subways, and the share of Mr. Marrable in the design of that executed in the new street to Covent Garden, should not have been quite overlooked; and, inasmuch as the late Mr. Bunning not only designed but commenced the construction of the new street through the city, the fact of the completion of the scheme having been transferred from the Corporation to the Metropolitan Board does not transfer the design likewise. Mr. Butterfield is said to have introduced the use of coloured stone and marble into the Gothic style, as if such use had not previously been heard of. In all these cases a few words would have sufficed to express the true relation of the artist to the work; and the needful explanation should have been given at whatever cost of space, for inaccurate information is worse than useless—it misleads.

We appear to be at the beginning of what may grow into a new system, for there is a magical charm in *couleur de rose*; and when such an opportunity of taking an annual portrait of themselves is offered to some minds, the temptation to dip too deeply in that tint will be irresistible. Even now, in early days, it blushes into view in a hundred quiet spots. A manages to insinuate that the works named in his account are a mere trifle to the numerous other important ones which have fallen to him; B "has had large experience" in churches, schools, or villas; C is frequently consulted, or is appointed umpire, by this or that important public department; D, whom blind fate had destined for a builder, slipped past her, "competed with four architects and was successful" (David, the keeper of sheep, only slew *one* Philistine); E, who appears to be chiefly a builder, candidly places his works done in that capacity in the architectural division of the work. There is a good deal of this kind of thing, which would have been more in place in the sixth division, which has for its motto "Advertising is to business what steam power is to commerce."

So far as this feature of the work affords to professional men means of knowing more of each other, it is of small utility; and so far as it might be used by clients with the view of forming a judgment of the professional status of a particular man, it is a false guide. Small men of pushing tendencies obtain lengthy notices, while the leading names in several departments of practice are dismissed in a single line. The professed object of this feature in the work, which is to raise the status of the profession, can hardly be obtained, but the status of individuals may be affected, and it will open a fine field for the practice of an art which has been somewhat neglected by professional men. The proprietors will do well to consider whether all desirable objects will not be fulfilled by giving only the name and address of architects and engineers, the degrees, honours, and appointments of a public nature which confer responsibility, or are of use as matters of information, together with the titles of any literary work by which they may have endeavoured to render their experience useful to their fellows. The space so gained may well be filled with useful facts, and continued care in the collection of information of this kind will no doubt ensure the success of their undertaking.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE closing meeting of the session of this Institute took place on Monday evening last, Mr. James Clarke, vice-president, in the chair, at which a paper on "The Terra-cotta Work adopted in the New Alleyne College, Dulwich," by Mr. Charles Barry, was read.

The author of the paper commenced by remarking that he need make no apology for introducing the use of terra cotta for strictly architectural purposes to the consideration of the meeting. Interest has been taken in its revival and use in many directions of late years, and the fact that in this practically imperishable material we have preserved to us more completely than in any other the thoughts and works of artists from almost fabulous antiquity, through each successive age of the world and in every country at any time civilised, down to our present time, serves to show the immense field there is for intelligent inquiries into the use and advantages of the artistic employment of such a historic material. All nations whose early history is known, Egyptians, Greeks, Romans, Gauls, have left us records of their thoughts in terra cotta, as well as in other materials which are usually deemed of a more noble character, thus showing that its importance has never been entirely lost sight of; and coming down to more recent times we have its use and facility of application exemplified in the numerous buildings of Italy, particularly North Italy, with a beauty and artistic fancy which must, he thought, satisfy the most fastidious artistic taste.

Having traced the history of the employment of burnt clay for articles of domestic use from the most remote ages of the world down to its adoption for architectural work in Italy in the twelfth century, Mr. Barry went on to speak of the development of this material under various manufacturers in this and other countries, and then proceeded to treat the subject in a practical form under the following heads:—

1. The materials used and the mode of manufacture.
2. The advantages attendant on its use in lieu of stone.
3. The difficulties which attend its use in an ordinary architectural work.
4. Its cost compared with stones in ordinary use.
5. Its resistance to transverse and crushing strains.
6. Its durability and miscellaneous special qualities.

The materials used are the clays of Cornwall, Dorset, and Northamptonshire, Lynne sand, ground glass, China stone, felspar, and flint; also broken terra cotta, or burnt ware pulverised. For very light porous articles fossil bone is used with terra cotta. The variation of colour in white, buff, and red terra cottas is due to the clays. Other colours, such as black, grey, green, blue, &c, are obtained by the admixture of mineral colours with clays and other substances forming the body of the ware. Having described the manipulations of the ingredients, the author re-

marked that clay thus prepared can be used by a sculptor for modelling a statue, or by a mason for running a moulding with a template. When the same form of design has to be repeated more than once or twice, it is desirable, for economy, to make a model, and from that a plaster mould, and impress the clay into the mould, the size of the object determining the thickness of the clay. For architectural works, the smaller the pieces, or the nearer they approach to the size of a large brick, the more economical will be the work. At the same time, there is no practical objection to using terra cotta in large pieces. These are then made hollow, for the purpose of ensuring equal hardness and contraction throughout, and it used, as at Dulwich, bonded into the walls as stone would be, they are filled at the work with fragments of terra cotta in Roman cement, although he was not at all sure it was essential, as the transverse strength, even of the hollow blocks forming projections of cornices, strings, and the like, is very great, and he believed sufficient.

On the advantages of terra cotta to architects Mr. Barry remarked that foremost among these is the facility it affords to architects to see, actually full size, any of the more ornamental portions of their designs, inasmuch as the material actually built in is the same as that modelled, and he submitted that a far better reflex of the personality of the architect will thus be found in a building than can ordinarily be the case. Again, except where there is much repetition, no moulds are used, so that bassi-relievi, enriched panels, friezes, sculpture of animals, foliage, or figures, made in terra cotta, and used in a building, cannot be copied. They are and must remain the sole originals, and thus have a greater value to the artist or architectural student than when it is possible to find the same composition in different buildings, in perhaps totally different positions and circumstances from those in respect to which it was originally designed. The other points of advantage claimed for this treatment were the opportunity it gives for brilliant effects of light and shade by the facility of what in masonry would be undercutting, but in terra cotta is the appearance of separately modelled pieces of the material superimposed over the recessed parts while all are in a plastic state. Then there is the opportunity of heightening the effect of a design by the use of terra cotta blocks of delicately varied harmonious tints. The next point is its indestructibility and freedom from decay by the action of weather and the acid gases contained in the atmosphere of the metropolis and other large towns. Next there is the practical question of weight, and consequently of cost of transport. In the case of stone brought in masses to the building and then worked up, the necessary quantity of waste makes up an alarming amount of useless weight, which has to be transported in order to produce a given result. With terra cotta, on the contrary, where the work is necessarily modelled in the workshop and studio of the manufacturer, and moreover is for thoroughness of burning made of moderate thickness and hollow, the weight to be conveyed is reduced to a minimum. The weight of terra cotta, as compared with some building stones, was given as follows :—

Portland...	158lb.	per ft. cubic
Hapton Wood	158lb.	,,
Bolsover...	140lb.	,,
Kelton	128lb.	,,
Terra cotta (solid)...	122 b.	,,
Terra cotta (hollow 2in. thick	68lb.	,,

Of the difficulties in the use of terra cotta one of the most embarrassing is the arrangement necessary to have the blocks made and ready on the ground almost before the rest of the work is begun, in order to work in when wanted as the bricklayers progress. There is also some considerable extra labour in the office put on the architect by the use of terra cotta, arising from the necessity of making all full-size detail drawings one-twelfth larger than the wall is to finish, in order to allow for its contraction, which is in that proportion. Another disadvantage is the risk in making and burning, the annoying result being sometimes that all the pieces of a large window or door are perfect except a few, when the work must stop till new blocks in lieu of the defective ones are made, or a temporary block must be put in and replaced with the proper one when ready. Next there is the maker's difficulty of burning blocks which are to constitute jambs, strings, and continuous features so as to be perfectly true and correct in the mouldings, but a marked improvement has taken place in this respect in the work sent up by Mr. Blashfield to Dulwich now as compared with that at first sent. In the rubbing down of surfaces with sharp sand and water there is no risk with properly manufactured terra cotta of getting a less lasting weather surface. The risks referred to are much reduced if the size of the blocks is not too great.

On the subject of the cost of terra-cotta work the author observed that he would mention some actual facts by way of examples, which as far as they went were highly satisfactory, yet in his opinion the cost of terra cotta would be largely reduced if it became a material more extensively employed in this country than it hitherto has been. In that case no doubt in all the items of manufacture more economical arrangements might be made than those now found in terra cotta manufactories. At the same time, with all the existing drawbacks, the economy of terra cotta as compared with stone is great. Speaking in general terms it may be said that, taking cube for cube as fixed in a building, terra cotta costs a little less than the soft stones, as Bath, Caen, &c., while as regards Portland the average differences would be about 35 to 40 per cent. The greatest economy is to be found when there is much work either in under cutting of mouldings, which costs nothing extra in terra cotta over ordinary mouldings, and in artistic modelled work. To give the meeting some useful facts he would mention that the ground floor windows at Dulwich (as shown in a drawing exhibited) have been made and fixed complete for £19 each ; their cost in Bath stone would have been £20, and in Portland £28. The principal floor windows, which are of rather elaborate design, have been fixed complete for £41 each ; they would cost in Bath stone £57 ; and in Portland £86. This cost includes the modelling the busts in high relief. These windows do not come with all their work to more than 5s. 6d. per cube foot. The second floor windows have been fixed complete for £10 each ; they would have cost in Bath stone £19 ; and in Portland, £28 10s. each. The cost per foot run of the cornice, which is 15in. projection and 4ft. high exclusive of the stone corona, fixed complete, is £1 13s. a foot run ; in Bath stone it could not be done for less than £4; and in Portland, £6 per foot run.

Attention having been directed to the specimens of terra cotta exhibited in the room, consisting of hollow blocks, &c., of an average thickness of 2in. of material, the author went on to state that if the blocks are made hollow and filled in with broken terra cotta or brick in Roman cement, the cost may be stated as 3s. 1d. a cube foot. The relative cost taken in the same way would be about 5s. 6d. for Bath stone, and 9s. for Portland.

The next point treated of was the strength of good terra cotta as compared with that of the stones in ordinary use. A table of experiments upon terra cotta manufactured by Mr. Blashfield, of Stamford, and carried out at the testing works of Mr. Kirkaldy, at Southwark, was exhibited, which showed the results of 46 experiments made with different shaped pieces of terra cotta, some of them solid, some hollow, but left empty, and some with the hollow blocks filled in, as was done at Dulwich, with brick and Roman cement. The result of these experiments showed that the filling in doubles the strength of the hollow blocks, as the one showed signs of cracking with a strain of 42 tons to the square foot, and the other required 86 tons to produce the effect. In these experiments the ware was only 1¼in. thick, while the thickness of that used at Dulwich was always 2in. A solid 12in. cube of terra cotta did not show a crack till a strain of 442 tons was put upon it, and to crush a hexagon stable floor brick 4in. diameter and 2¼in. thick, required no less than 855 tons. The red terra cotta he had used for the shafts to jambs and mullions of the principal floor windows were proved to be capable of bearing a pressure of 246 tons on the square foot. It was remarked that the clays which are technically termed "fire clays," and resist the largest amount of heat, are the weakest against a crushing or transverse strain, and those which flux or run at a less heat are the strongest.

In his general remarks on other qualities of terra cotta the author remarked that the absorption of terra cotta, as compared with Bath stone, is considerably less. In experiments to test the wearing capabilities of terra cotta tiles for foot traffic on Westminster Bridge, the friction of sharp sand and water was applied to a terra cotta tile 12in. square, and a similar piece of York stone, for five hours, at the end of which it was found that the terra cotta tile had lost 1-16in. in thickness, while the York stone had lost ⅛in. It was, the author remarked, necessary to caution his hearers that all that had been said was, of course, only applicable to terra cotta, in the proper sense of the word, composed of such materials as he had enumerated, very carefully mixed and blended and carefully burnt. Some materials were offered in the market as terra cotta, which are nothing but clay and common sand. Such compositions will not bear, without great distortion, the necessary firing heat, and are consequently soft on the surface, with little transverse strength, and not durable. He mentioned that there had been recently discovered at Watcombe, in Devonshire, some very excellent terra cotta clay nearly pure from all foreign matter. The ware made from this, without any mixture of other substances, is said more nearly to resemble the best Italian terra cotta than any other. This clay existed in an enormous mass not far from the surface. Mr. Barry proceeded to enumerate the more recent instances of the use of terra cotta in buildings in the metropolis, &c., as also a list of the best moulded brick remains in England dating from 1260 to 1507.

In conclusion, he remarked that there need be no jealousy or fear on the part of masons that if terra cotta be largely substituted for stone, their trade will be injured. It is but a new material for them, with the peculiarity that their work with it lies in the manufactory when the clay is in a rather hard dry state. Then they can work mouldings, mitres, &c., in it with ease and perfect truth. Then stone carvers may add their works of taste and fancy in a material soft and plastic enough to give them free scope, but to become as their hands leave it, by being then burnt, an imperishable work. In the building also terra cotta should always be fixed by a mason, and not an ordinary bricklayer.

At the conclusion of the paper a vote of thanks was passed to Mr. Barry, and the discussion upon it was postponed till the next session.

A short paper, descriptive of the plans of hospitals at Paris, Munich, and St. Petersburg, was read by Doctor Oppert, which brought the proceedings of the session to a close.

PARLIAMENTARY NOTES.

On Friday night in the House of Lords the Marquis of Salisbury asked if it were true that the Government had rejected the design which was recommended by the professional judges, and the judges of design, as the best for place and internal arrangement, and had adopted the design which was recommended by elevation only ; and further, if the competitors were instructed that utility and convenient arrangement were to be preferred to architectural effect. He had understood that the Government had instructed the competitors that convenience for the transaction of public business would have the preference, and when Mr. Barry's plan was selected by the judges for its utility the Government had set it aside, and adopted Mr. Street's plan, which was recommended only for its elevation? He strongly deprecated such a practice on the part of the Government. The Lord Chancellor said the Government had neither selected nor rejected any design. The matter was left in the hands of the five judges of design, and they said that all the designs were so good that they were unable to say which was the best, but they considered Mr. Barry's the best for internal arrangement and Mr. Street's for elevation. The award was sent back to them for reconsideration, but they returned it, saying they could make no other. By the terms of the competition any dispute that arose was to be referred to the Attorney-General, and that was accordingly done. He decided that the award was invalid, and there was an end of the competition. It happened that about that time there was a competition for the National Gallery, and the same thing occurred there—the judges could not say which was the best, but they did say that Mr. Barry's plan had the greatest architectural merit. Upon that the Government gave Mr. Barry the superintendence of the National Gallery, and Mr. Street that of the Law Courts. After a short discussion the subject dropped.

On Friday last the Towns' Drainage and Sewage Utilisation Bill was read a second time in the House of Lords.

About fifteen varieties of marble are quarried in Italy ; the annual value of that exported from Carrara amounts to upwards of a million francs.

THE NEW LAW COURTS.

MR. E. M. BARRY is not satisfied with the decision of the judges in this matter. He accordingly writes to the public newspapers, inserts large advertisements, and petitions the House of Commons. In this petition he states that the contract between the Government and the competitors prescribed that utility and convenient internal arrangement were to be the chief points to be considered, and were to be treated as superseding all considerations of architectural effect, so that the winner in the competition should be the architect who had produced the best plan; that the judges, whose award was to be final, had declared that his plan was the best, and that two of them—Messrs. Shaw and Pownall—had recorded their opinion in a detailed report, awarding forty-one points of excellence to Mr. Barry and only three to Mr. Street. Mr. Barry concludes his petition by a prayer asking for a select committee to inquire into the case, so as to ensure a decision consistent with "the interests of the public service." Mr. Lowe, who presented the petition, gave notice of his intention to move for a select committee on the subject of the petition of Mr. Barry. If this committee be appointed we hope that its duties will not merely be confined to an inquiry into the relative merits of the respective plans of Messrs. Street and Barry, or the relative merits of those gentlemen as architects, but that "the interests of the public service," as Mr. Barry puts it in his petition, will receive due consideration. A survey of the history of this competition will show that many and manifest mistakes have been committed. In fact, it would be next to impossible for ordinary mortals to conduct so important an undertaking without making mistakes. Mr. Barry, whether he is aware of it or not, is going the right way not only to disturb the decision of the Treasury, but to overturn the whole platform which has been erected, and there are many who wish him to succeed, not that he may become the architect of the new Law Courts, but that a clean sweep should be made of the whole matter preparatory to proceedings being commenced anew. Mr. Barry's policy leads to this point or nothing. He must see that he cannot successfully oppose the decision of the Government without giving the Government an opportunity for saying that the whole matter must be reconsidered. And if it is to be reconsidered in the case of the Law Courts, the decision on the new National Gallery will meet with a similar fate. What will Mr. Barry have got by his petition then?

HOUSE AT SEVENOAKS, KENT.

THIS house, of which we give perspective and plans, has been erected, under the superintendence of Mr. John Johnson, architect, Moorgate-street, City, by Mr. D. Grover, builder, on a plot of ground belonging to him in St. John's-road, near Sevenoaks. It is built to suit the requirements of a gentleman who receives a limited number of pupils to prepare for college. The plan was originally arranged to form two houses, but as the cost was considered too great, the staircase, &c. was omitted and the pupils' rooms placed close to party wall. It was also required that the pupils' portion of the house should be separated, yet conveniently accessible without interfering in any way with the private portion Everything has been considered in making the left hand side of the party wall thoroughly complete as to domestic arrangements, so that by adding staircase, &c. at any future period on the left hand side another house could be formed. These considerations have been kept in view in case at the expiration of the present lease there would be a difficulty in letting so large a residence.

The materials used in the exterior are light yellow bricks, with Bath stone dressings, and red bricks in bands and arches; as the builder had a quantity of rag stone on hand the basement walls were built of that material, with quoins of Bath stone. Between the plinth and ground-floor window sills a broad band of red bricks was inserted to relieve the cold effect of the rag walling. All the external walls are built hollow to prevent dampness. The roof of tower is covered with lead. Balconies are provided at the upper part of tower, as some little escape in case of fire, provision being made for fixing ropes, &c., &c. The bay windows and conservatory are of wood painted a dark brown. The bay and several other wiudows have balconies to receive flowers. The entrance hall and staircase ceilings are of boarding, fixed diagonally, and divided into bays with moulded ribs with turned and carved pendants. The soffit of stairs is of V-jointed boarding, the joists of galleries show, and are moulded and chamfered, stained and varnished. The floor of staircase, also the stairs, are stained and varnished. The entrance hall and conservatory are paved with red and buff tiles, with red and black borders The walls of entrance hall and staircase are distempered, with the exception of about 4ft. from the floor, which is painted a maroon colour, a small amount of decoration being placed at the junction with the distempering. The soffit enrichments to the coruices of principal rooms were designed and modelled by the architect, so that they should be in character with the rest of the work. The supply and service pipes pass through the waterclosets to the main cistern, and adjoin the hot-water pipes from kitchen boiler to bath, so as to avoid the possibility of freezing in winter. The accommodation in the basement consists of kitchen, scullery, servants' sitting-room, large cook-house and store closets, larder, pantry, wine, beer, coal, and wood cellars, boot cleaning room, box-room, boys' play-room, with water-closets, &c., adjoining.

TENDERS FOR THE WHITEFRIARS THAMES EMBANKMENT.

OUR readers are aware that tenders have been invited for this work on three separate occasions. The highest of the tenders is £314,700, the lowest £126,500—a difference of £218,200.

TENDERS FOR No. 3 CONTRACT OF NORTHERN THAMES EMBANKMENT.

	ARCHED. Original specification. Tenders opened on Oct. 5, 1866	ARCHED. Modified specification. Tenders opened on April 17, 1868.	SOLID. Tenders opened June 19, 1868.
Hiscock & Williams	£344,700	—	—
Joseph Thackery	320,000	—	—
Brassey & Co.	305,000	£193,000	£137,900
Hill & Keddell	302,000	232,000	179,000
William Webster	268,000	195,000	126,500
T. Pearson	265,000	225,000	144,000
A W. Ritson	239,000	224,450	—
Jennings	—	225,000	146,649
George Furness	—	236,000	—
Thomas Docwra & Son	—	217,000	142,000
Kelk, Waring Bros., & Lucas	—	187,183	127,000
Eckersley & Bayliss	—	169,800	159,000
Thomas E. Ridley	—	—	173 500

At the meeting of the Metropolitan Board, on Friday, June 19, the tender of Mr. William Webster, £126,500, was accepted.

The Archæological Institute will hold its annual meeting at Lancaster on July 28 next. There will be excursions to Furness, Cartnell, Levens Hall, Sisergh Hall, Skipton Castle, and Bolton Abbey. A temporary museum will be formed in the Mechanics' Institute.

PROPOSED COURTS OF JUSTICE—TEMPLE BAR.

MR. STREET having been selected as architect for the new Courts of Justice, our readers will not object to see an illustration of his design for Temple Bar, as submitted in the competition last year, and which evoked a considerable amount of criticism at the time. No doubt the propriety of re-erecting Temple Bar in any form will, like many other matters in connection with the said Courts, undergo reconsideration before the time for its erection; and, though it forms a portion of Mr. Street's design on paper, we doubt whether it will form a portion of the completed edifice.

SCHOOL OF ART.

THE seventh annual report of the Boston Are School has just been published, from which it appears that the number of pupils who attended the different classes during the past year was 86, 68 in the first session, and 63 in the second. The amount of fees paid by them was £101 4s. The total income from all sources for the year was £166 15s. 10d., and the expenditure was £162 1s. 3d., leaving a balance in hand of £4 14s. 7d. The committee "have again to express their regret that the advantages of such an institution as a school of art have not been as yet appreciated by the working men and artisans of this town to any satisfactory extent. At a time when so much is being said and written on the subject of 'Technical Education' for artisans, and the acknowledged deficiency of our country in this respect, when compared with the continent, the reluctance on the part of the working men to embrace all available opportunities of supplying the want is the more to be regretted. On the other hand it is a great satisfaction to the committee to know that, independently of the school, but under the direction of the art master, a large portion of the boys of the town in the various schools are receiving the groundwork of a most valuable technical education in art, and with no small success; and they hope, when the required subjects have been passed by them in the parochial schools, that the more promising of the pupils will be drafted into the art school in order to complete their education." During the past year a night class has been opened at Louth by the art master (Mr. V. Howard), and has been recognized by the Science and Art Department as a branch of the Boston school.

COMPETITIONS.

THE plans of Mr. Edward Holmes, of Birmingham, for the erection of cow lairs, pig dormitories, and other improvements to Smithfield Market, Birmingham, which were submitted in limited competition, having been selected by the Markets and Fairs Committee of the corporation of that borough, were approved by the Town Council at their last meeting. The same committee have also selected a design by the same architect for a new fish market, to be erected on a site opposite to the market hall in Bell-street; the report on those plans has been referred back to the committee with a view to consider and report upon the adaptability of a site which is considered more suitable on account of its approximity to the Central Railway station.

The plans submitted by Messrs. Francis under the motto of "In Domino Confido" in the late competition for a new church at Slough, have been selected by the committee, subject to the architects being able to satisfy them that it can be executed for the stipulated sum of £10,000. We understand that the funds at present in hand do not warrant the immediate commencement of the church, so that ample time will be afforded during which the required test may be applied to Messrs. Francis' design. It will be remembered that in our notice of this competition we placed the design with the motto "Triangles intersecting" first. One of the conditions of the competition was that "the committee purpose calling in a professional man to aid them in coming to a just decision." Mr. Christian, of London, was accordingly called in for the purpose, and we are informed on good authority that he selected the same design as we did for the first premium. The committee, however, disregarded the advice of their own referee, and selected the design submitted by Messrs. Francis.

LINCOLN DIOCESAN ARCHITECTURAL SOCIETY.

THIS society, which has now existed a quarter of a century, held its annual gathering at Lincoln last week. On Wednesday morning, immediately after Divine service, the Rev. Precentor Venables, accompanied by the members and friends, gave a lecture on some of the more interesting monuments in the cathedral, including those of Remegius, first Bishop of Lincoln, Katherine Swinford, Sir Robert Burghersh, Sir Nicholas de Cantilupe, Prior Wymtysshe of Noeton, Bishop Fleming, Bishop Russell, Bishop Longland, Little St. Hugh, &c.

The company then adjourned to the County Assembly Rooms, where E Sharpe, Esq., delivered a preliminary lecture on the "Architectural Features of the Cathedral."

At the evening meeting held in the County Assembly Rooms (the Bishop of Lincoln in the chair), a paper was read by Mr. Gambier Parry on "The Polychromy of Lincoln Cathedral," and another by the Ven. Archdeacon Trollope, F.S.A., on "The Ermine-street, or Great Roman Road of Lincolnshire." We are prevented from want of space from giving the last-named paper in its entirety, and can only show the value of it by a few extracts:—

"This great work, constituting one of the four principal Roman roads of Britain, may fairly vie with any of the other three, both as to length and grandeur of design. Its Roman name is lost, but by the Saxons it was termed Earminga-street, or Eormen-street, the terminal of which, derived from the Roman stratum, is still represented by the modern word street, or road. Perhaps the term Earminga or Eormen was derived from the name of some British tribe, as Wætlinga-street was from Wætla, or from Eormen, a Saxon deity, or the same word applied to anything vast or noble. That portion of it running from Castor near Peterborough, to the Humber, which I can now alone describe, is called by various names in, certain localities, such as the Forty-foot or Norman-gate, the High-dyke, the Old-street, and the Ramper, but the whole constituted one continuous road, still usually designated the Ermine-street. The Romans were certainly not the first road makers in Britain, whence it is quite possible that part of the great military roads they constructed followed the lines of more ancient ones; but these Roman works so far surpassed all that had before existed as to constitute a new era in British road making, which must have been regarded with wonder by the natives of this island, although they perhaps looked angrily upon them as serving to confirm their subjugation.

"The structure of the Ermine-street was not so elaborate as that enjoined by Roman authorities on this art, for from a section of it discovered in the parish of Winterton, as carefully recorded by Mr. Padley, to whom I am indebted for the information, the earth has been excavated to a depth of 17 inches, and then two layers of rough stones on edge slanting in an opposite direction were laid to constitute the foundation of the road, which had no central rise, nor was there any trace found of the summum dorsum, or surface paving. The width of this paved portion of the road was between 12ft. and 13ft., and the ordinary height of its embankment 3ft.; but some portions of it are considerably higher. Of the date of this ancient work we have no record.

"The Ermine-street, in its entirety, may be reckoned to commence at Pevensey 'Auderida,' whence it ran to Chichester 'Regnum,' and London; passing along Bishopsgate-street, it proceeded by Enfield, Cheshunt, Ware, Broughing—'Ad Fines,' Royston, where the Ikenild-street crosses it—Caxton, Godmanchester 'Durolipons,' Huntingdon, Stukely, Sawtry, Stilton, to a point between Chesterton and Atwalton, or the site of the great station of Durobrivæ, close to the village of Castor, in the county of Northampton. This at least in part existed before the Ermine-street was constructed, as demonstrated by the remains of a Roman potter's kiln found by Artis beneath the bank. When made, the road was carried through the centre of an entrenched camp of an irregular oblong form, now called 'the Castles,' or else the camp was subsequently formed to take advantage of the road.

"The road, after leaving the above-named camp, and crossing the River Nene, divides that which may be termed an eastern branch of it, coming nearly due north to West Deeping, Bourn, Sleaford, and Lincoln, which I cannot now advert to; while the main road continued to run for some way in a north-westerly direction, to which I must confine my description. Passing Sutton Wood on the east, this road bisects the hamlet of Southoree, where coins of Antoninus Pius, Marcus Aurelius, Claudius Gothicus, Magnetius, and Constantine the Great have been found, together with Roman pottery, &c., chiefly in the pits on the eastern side of the road. Next it may be traced in the parish of Barnack as a wide tank, thus described in 'Gough's edition of Camden, v. 2, p. 270.' Here it rears a high hedge, particularly in the little wood of Barnack, where it has a watch tower upon it. This so-called watch tower, however, no longer exists, but a Roman fibula and some urns were found close to the Ermine-street, at Barnack, in 1731; since which many Roman coins have also been picked up here, and more recently the torso of a small male figure cut in Bernick stone was dug up, now in the possession of the incumbent, the Rev. Canon Argles. Hence the Ermine-street runs by Walcot Hall and through Burghley Park, since its enlargement by John, Earl of Exeter, in 1665, but before that time it formed part of the public road between Stamford and Peterborough. Here it is now not traceable, because its bank having been formed of gravelly materials, was carted away to make walks about Burghley House; 'Bridge's Northamptonshire, vol. 2, p. 501.' Next it may be detected crossing a branch of the Welland, near Wothorpe Park wall, where its bank is 3ft. high and 20ft. wide, whence it descends the valley of the Welland, and crossing that river at a spot on which Bedcroft Hall formerly stood, enters Lincolnshire, according to Stukeley's words, 'with broad elated crest.' Passing by the sites of the Benedictine Nunnery of St. Michael's and the Augustine Priory, it leaves the town of Stamford on the east, in the form of a broad raised bank, called Greenbank, and then, as a turnpike road, reaches Casterton. None of the Roman Itineraries mention the existence of any town or station between Durobrivæ and Causennæ, yet there certainly was a large camp at Casterton, ten miles north of Durobrivæ, or Castor, a considerable portion of which still remains, close to the Ermine-street. Probably this camp, like the one below Castor, was made before the road that subsequently passed by it. It is situated in the bend of the River Gwash, which thus defended nearly two-thirds of its circumference. Its area was about 27 acres in extent, and it was probably wholly surrounded by a fosse and vallum. [The via is then traced throughout its course to the Humber; and the Archdeacon points out as he proceeds all the sites where Roman camps and stations are known to have been fixed during the Roman occupation of this part of England.] Between Ancaster and a spot called Bayard's Leap, where it is intercepted by the Sleaford and Newark road, the Ermine-street presents a grand appearance, its well developed bank from 3ft. to 6ft. high, and wide in proportion, remaining in nearly as perfect a condition as when it was first made by the Romans."

WATER SUPPLY AND SANITARY MATTERS.

THE first instalment of the drainage works which have for the last eighteen months been in progress at Douglas, Isle of Man, for the improvement of the sanitary condition of the town, has been completed. The portion finished consists of a main intercepting sewer running along the shore, and of an outfall sewer, which empties all the sewage into the bay. The cost of the work has been about £4,000; but in addition to this a large number of district and subsidiary sewers have been formed. The engineer of the works is Mr. G. W. Stevenson, C.E., borough engineer of Halifax, and the contractors Messrs. Quine and Kewley, of Douglas.

On Monday Colonel Sir Wm. Denison, K.C.B., Royal Engineers; Dr. Ed. Frankland, F.R.S.; and Mr. John Chalmers Morton, with their secretary, Mr. S. J. Smith, visited Bolton. The commissioners were met by the Mayor (Mr. Jas. Barlow) and the Sanitary Committee, and after explaining the object of their visit, proceeded to inspect the River Croal and the arrangements for the sewerage of the town, as also the present and prospective water supply.

The town of Harrogate is to have a combined system of sewerage and irrigation at a cost of £7,000. The plans and specifications were passed by the Improvement Commissioners on Monday, and the works ordered to be advertised.

The Sanitary Commissioners have very properly recommended the removal of the Regent's Park barracks to a more appropriate site.

Building Intelligence.

CHURCHES AND CHAPELS.

Hawley Church, Hants, has been opened after enlargement. A new chancel has been added also a south aisle and north and south transept. A handsome reredos of Caen stone inlaid with coloured cements, with shafts of green Connemara marble, has been erected by Bell, Redfern, and Allen. The style is thirteenth century Gothic. The designs are by Mr. C. Buckeridge, of Oxford, and the works have been carried out by Messrs. Goddard and Son, builders, Mr. John Pickering being the clerk of the works.

On Tuesday, the foundation stone of a new church was laid at Avon Dassett, Warwickshire, to be built on the old site, the old one being both unsound and unfit for public worship. The new church is designed by Mr. C. Buckeridge, of Oxford. The cost will be for building £2,500.

A new Baptist Chapel has been opened at York. The style is Early Decorated, and the building will seat 700 persons, at a cost of £5,000. Mr. W. Penchey, of Darlington, is the architect.

A new Methodist Chapel has been opened at Monkwearmouth. The style is Gothic, and it is built of white brick, with stone dressings. The chapel will seat 1,000 persons, at a cost of £2,300. Mr. Joseph Potts, of Sunderland, is the architect.

On Friday last, the Bishop of Chester consecrated a portion of the new cemetery at Bebington, set apart for the interment of members of the Anglican Church. There are three chapels within its precincts for the respective use of Dissenters and members of the Roman and Anglican communions. The chapels are erected in the Gothic style, from the designs of Mr. G. W. Hamilton, architect, of Liverpool, by Mr. J. Dobson, contractor, of Rock Ferry.

The ancient church of Lutterworth is now being restored under the superintendence of Mr G. G. Scott, R.A. The fund raised, notwithstanding all the exertions of the committee, that is at present available, will barely complete the work of the nave, chancel, and north aisle. An earnest appeal has been made by the minister of the parish for funds to enable the committee to complete the restoration of this old church, which remains as a monument to John Wickliffe, the champion of the Reformation.

The laying of the foundation stone of the church, crypt, mortuary chapel, &c., to be attached to St. Mary's Mission Home and Retreat, now in course of erection upon the western slope of Kinnoull Hill, and on the east bank of the River Tay, Scotland, took place on Tuesday week. The site of the Retreat is an elevated one, and, having a front to the west, commands a splendid view. The Retreat consists of four storeys, and the style of architecture is Early English. Mr. Helton is the architect.

At an adjourned meeting of the Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels held at the society's house, No. 7, Whitehall, S.W., on Monday, the Lord Bishop of Oxford in the chair, in addition to other important business, the laws and regulations of the society were amended, and the report of the sub-committee with reference to the memorial of the London Free and Open Church Association was received.

On Saturday last the corner stone of a new Methodist Chapel was laid at Longwood, near Huddersfield. The building will be of stone, and rather plain, the only ornament being in front in the shape of pilasters and moulded semicircular projections. The chapel will seat 250, at a cost of about £1,100. Mr. J. Balmforth, of Milnsbridge, is the architect.

On Saturday last the foundation stone of a new Wesleyan Methodist Chapel was laid at Whalley Range, Lancashire. The style of the building will be thirteenth century Gothic, and it will seat 750 persons, at a cost of £7,300, including schools attached to the chapel. Mr. J. Webster, of Manchester, is the architect, and Mr. Clay, of Audenshaw, the contractor.

BUILDINGS.

A new terrace, consisting of twenty-five houses, is about to be commenced at Aberystwith, on the north, facing the sea, beyond the Queen's Hotel, behind the new sea wall. J. P. Seddon is the architect.

A block of model buildings for artisans is being built at Fulham by the Bishop of London to replace a number of dilapidated small houses, on the side of the road, near the entrance to the Bishop's palace. The houses will accommodate twenty-eight families, each with sitting rooms, two bedrooms, and scullery. The contract was taken by Mr. Thomas Williams, of Canton, near Cardiff, for £4,400. J. P. Seddon is the architect. The houses are calculated to pay 7½ per cent. We intend to publish the plans.

A block of workmen's cottages is about to be built at Dytchley, Oxfordshire, for Lord Dillon. J. P. Seddon, architect.

The inauguration of the new Congregational Institute, Nottingham, took place on Wednesday last week. It is to accommodate from 80 to 100 students. Mr. R. C. Sutton, architect, prepared the designs. Messrs. Bell and Wood executed the stone work, and Messrs. Stevenson and Weston the woodwork. Mr. Sutton has adopted the Gothic style of the fourteenth century.

The new fortifications at Hurst Castle, at the entrance of the Solent, are nearly completed.

A block of new buildings for the labouring classes has just been erected in the parish of St. Thomas, Oxford, under the superintendence of Mr. E. Bruton, architect. The block consists of 30 sets of dwellings, each a complete house in itself. They are approached by four staircases, and all of them have a sitting-room, one, two, or three bedrooms, a scullery, a water-closet, a coal place, and a larder. They have a distinct water service unconnected with the closet supply, and a shaft runs from each scullery, into which dust and other refuse may be swept. The Prince of Wales, during his recent visit to Oxford, visited and carefully examined the buildings.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—J. T.—S. and W.—R and C.—B. F.—T. P.—W. H. B.—W. and B.—F. H. J.—W. T.—T. D.—R. and S.—J. B., jun., with photograph of ship—W. H. B.—Professor I. C. C.—B. J. T.—G. T. R.—I. F.—M. A.—B. and Co.—T. W. J.

E. S.—With M.S. on "Lincoln Cathedral," too late for this week. We go to press every Thursday afternoon.

Correspondence.

USE OF ASPHALTE.

To the Editor of the BUILDING NEWS.

SIR,—In reference to your article III. on the use of asphalte for roofs, your readers must be warned that the greatest care must be taken in regard to the article employed, for the original substance, if diluted with other matters, may be deteriorated to a very great degree. Acting on the faith of the name of a well-known concern, who largely advertise their article, I employed it over a study and library of the late Lord Palmerston, at Broadlands, but it proved so unsound and rotten that by his lordship's own instructions, founded upon his official experience, I applied to the Seyssel Pyrimont Company to replace it, and we had every reason to be satisfied with the manner in which they did their work, as to the quality of the material and the mode of laying it down. It lies upon a thickness of concrete supported upon wrought-iron joists similar to Fox and Barret's principle of construction, adopted in order to keep out the heat of the flat. In regard to the incombustibility of asphalte, I think that requires rigorous examination. When in Switzerland in 1866 and passing from Neufchatel to Dijon, I saw a village, which had just been burnt down, and where the flames had communicated from house to house and street to street by the foot pavement covered with asphalte. Whether any quantity of bitumen had been mixed with the asphalte in undue proportion, and thus caused the conflagration, I know now, but the fact of the communication of the fire by the foot pavement was a matter of well-known publicity.—I am, &c.,

TH. L. DONALDSON.

21, Upper Bedford-place, Russell square,
June 20.

[The material noticed in the Professor's letter was probably a gas tar composition, which is inflammable. That which gives the chief value to Pyrimont rock asphalte is the peculiarly solid quality of its bitumen, and its intimate combination with carbonate of lime. The analysis of the rock proves it to be composed of bitumen from 9 to 10 per cent, the remainder being pure carbonate of lime. When made into mastic, from 10 to 20 per cent. of grit is substituted for a similar proportion of the carbonate of lime, and only 5 per cent. more of the same bitumen is added. Thus manufactured it is uninflammable, and it is evident that it is the preponderance of the two latter materials over and above the bitumen that endows it with this distinguishing property. The experiments referred to in our article III. fully bear out this statement. For further particulars we can refer our readers to practical observations on the cement of Seyssel, by F. W. Simms, C.E., late of the Royal Observatory, Greenwich, published by Weale, of Holborn.—ED. B. N.]

MR. MOORE'S DECORATIONS.

SIR,—Being well acquainted with the Queen's theatre and its decorations, I have read the letters on the subject with much interest. I find it stated in Mr. Moore's letter that certain alterations, viz., altering the ceiling, obliterating the colour on the backs of the boxes, and changing the colour of the seats, had been made without his knowledge. Now, reading Mr. Phipps' letter carefully through, I cannot find that he denies one of these points. It is true, indeed, that he begins by talking of an "unequivocal denial;" but he immediately modifies this by admitting the alteration in the colour of the seats, which he somewhat evasively calls "three tiers of galleries." Your correspondent, "A Painter in Water colours," has more correctly described them as "dress circle and upper boxes;" in fact, the chief seats above the floor of the house. Then, as regards the charge of obliterating the delicate colour which the same correspondent assures us once covered the backs of the boxes, Mr. Phipps is totally silent. But as regards the alterations in the ceiling, he quotes a letter, which he does not produce, but states that he has received from the very person who executed the alterations. Surely it would have been more satisfactory, and certainly more in accordance with the usual custom in such cases, if Mr. Phipps had published this letter instead of giving his own account of its contents; but, according to his own reading, what is this truly important piece of evidence? Why, simply a corroboration of what Mr. Moore said in his own letter—that the alterations were made without his (Mr. Moore's) knowledge!

Mr. Phipps, having thus confirmed Mr. Moore's statements, might well have ended his letter here. The concluding portion certainly contains some ideas capable of discussion, such as whether theatre decoration really is "more lasting and higher work than simply easel pictures;" also, the problem of joint composition between the architect and painter has, for me, being an architect, much interest; but what has this to do with the question of exhibiting, as Mr. Moore's suggestions, drawings which have been, on his own admission, so much tampered with? I cannot say that the intention in introducing fresh matter of discussion was to shelve the original question, but truly it looks like it. But what I have most to complain of in Mr. Phipps' letter is, the general tone of insinuation and use of expressions calculated to mislead a casual reader. I have already noticed the false impression conveyed by the term "three tiers of galleries." Such expressions as "the young man, *a friend of Mr. Moore's*," who carried out the suggestions, "as he now asserts," are certainly not courteous, and have the effect of implying a doubt of his truthfulness. It is gratifying to hear that Mr. Phipps does, like every one else, deplore the utter want of harmony between the general decoration and Mr. Moore's picture. The expressions used in his preceding sentence (viz., that artists must work with the architect who employs them) would imply that the blame in this case rests with Mr. Moore. Now, as the existence of these drawings appears to point out that he actually did suggest a system of decoration in harmony with his picture, I cannot see the justice of such an insinuation.

I do not think that any apology is necessary from me for introducing myself into this discussion. The question is not one simply between Mr. Phipps and Mr. Moore, but one in which at least every one connected with this branch of art is interested and which was, indeed, originally raised by a third person; and, as an architect, I should be unwilling that Mr. Moore or any other artist should imagine that *all* architects consider themselves entitled to supervise and make alterations in works which they have entrusted to them to design. Whatever truth there may be in the theory that an architect should claim the supervision of such decoration, at any rate he should be a man of undoubted artistic ability. Mr. Phipps thinks that a satisfactory solution may be arrived at by the withdrawal of Mr. Moore's name; I doubt whether anyone else will see it in that light.—I am, &c.,

D.

SIR,—May I beg you kindly to insert the following answer to Mr. Phipps' communication of the 15th inst.? Mr. Phipps admits the change in the colour of the seat covers (for I suppose the expression "three tiers of galleries" is a professional mode of describing the dress circle and the upper boxes), but thinks that to complain of the introduction of this discord is "the veriest nonsense," and denies that the colour of the seats has anything to do with the decorations of the theatre. Are we to understand by this that he wishes frankly to confess that harmony of colour is to him a dead letter? Mr. Phipps' statement, that "a young man" prepared the drawings under my directions, partly at my chambers and partly at his, is incorrect in a very important particular, and calculated to mislead; for my supervision over Mr. Hart (*i.e.*, the young man referred to) and over the drawings entirely ceased when they were transferred to Mr. Phipps' office; and the changes that were afterwards effected in the designs—complete when they left me—were not even ever mentioned to me; so that the daily discussions between myself and Mr. Hart, referred to by Mr. Phipps, came to an absolute end before the alterations were thought of. The publication of Mr. Hart's letter would have been more desirable than the vague description of it that is afforded us.

What is one to understand when Mr. Phipps says that he should never have dreamed of appropriating a line of the sketch to himself, and then immediately after, that it is a simple matter to erase my name from the drawing altogether. Now, as there was certainly not a single line or shade of colour due to Mr. Phipps in the design as originally completed, I am quite unable to follow him in his suggestions.

Having got through the part of Mr. Phipps' letter which purports to be an answer to mine, I will venture (as some time has elapsed since my statement appeared in answer to "A. Z.") to recall what assertions I made in it, and to point out to what extent Mr. Phipps meets them. I said in my letter of the 3rd inst., "In the drawing of the ceiling, the squares and the outer belt of the fan-shaped part have been entirely changed. And in the other drawing, although no light and shade is used elsewhere, the backs of the boxes have been shaded so as quite to obliterate the colour originally placed there, and, not least, the seat covers have been changed to a colour that necessarily destroys the whole scheme. I have been so little consulted with respect to these alterations that I was not even aware of their existence till I saw the drawings the other day at the exhibition." Now, Mr. Phipps, though he announces an unequivocal denial, admits having recoloured the seat covers, is quite silent about the backs of the boxes, and makes a statement about the patterns in the ceilings which, confused as it is, will, I hope, be entirely disposed of by Mr. Hart.

I see no reason for following Mr. Phipps through his general remarks as to the relations of the architect to the painter, but as it rests with him at present to explain why an architect has freely altered an artist's drawings without consulting the artist, it is difficult to perceive what pertinence he conceives in his axiom that the aspiring artist "must, in a measure, work with the architect."

I must here observe that Mr. Phipps, at the time the drawings were undertaken, and while they were going on at my chambers, did not advance any scheme as to the decorations, but left the matter entirely to me. Nay, further, that he expressed his approval of my design when finished, and put it into the decorators' hands, who actually executed a small portion. It was not till afterwards, when a third party had stepped in and objected to the decorations, that he began to express any doubt about carrying them out. I may as well mention here that I did this design gratuitously for Mr. Phipps on his telling me that the matter would have to be left entirely to the decorators unless I considered it worth my while to undertake it merely for the sake of having the decorations carried out in keeping with my proscenium picture. So that an adequate idea may be formed of my recompense for making this design when I say that Mr. Phipps has never even gone through the form of thanking me, but freely allowed himself the expression of such insinuations as the one contained in his letter, that I took no interest in the general harmony of the decorations.

When Mr. Phipps talks of the want of harmony in the existing decorations of the Queen's Theatre he again appears to forget the questions at issue. However, as he has introduced the subject, I beg to say that if he wishes the history of this matter also to be made public I shall be most happy to oblige him.

Finally, in denying Mr. Phipps' italicised statement that Mr. Hart is a friend of mine, I wish it to be understood that I have the greatest respect for the latter gentleman, but that my acquaintance with him is founded entirely on professional or business relations, so that the term "friend," used in its usual acceptation, is not correctly applied.—I am, &c., A. MOORE.

17, Fitzroy-street, Fitzroy-square, W.,
June 23.

RYDE CHURCH.

SIR,—In your remarks on the drawing in the Architectural Exhibition last week, you again refer to Ryde Church competition, and state:—"We have been told that the cost of the selected design for this church at Ryde having proved beyond the estimate, it and its author have been set aside, and that the work has fallen into the hands of Mr. Gilbert Scott." In justice to the author of that design perhaps you will allow him a small space to state what are the facts. In the first place, as you may be aware, Mr. Scott was asked by the committee to give them a design for the proposed church; he did so, and obtained tenders for its erection, the lowest tender being £15,000. This the committee thought too high, and Mr. Scott made some alterations, and reduced it by £1,000. Ultimately the committee set Mr. Scott aside, and advertised for designs. Fifty-seven sets were, I believe, sent in, and I will do the committee the justice to state that they took a great deal of trouble to arrive impartially at what they considered the best design, and mine was selected, having doubtless many imperfections—at least you think so. However that may be, it was selected, and I was asked by the committee to get tenders for the erection, with the position of the tower altered and the chancel lengthened. Tenders were advertised for and a great number received; therefore, to show you that the design and its author have not been set aside solely because the tenders were too high, I quote the following separate tenders, mostly different men, but men who would undertake to do the work:—£8,204 12s. 7d.; £8,269 5s.; £8,424 5s.; £8,513; £8,805 10s. 7d.; £8,857 6s. 6d; £9,271 11s. 10d.; £9,426 11s. 10d.; £9,807 17s. 5d. The competition drawings were faithfully worked out in detail to obtain the tenders, quantities, with numerous lithographed sheets of illustration, were supplied, so that no contractor could be deceived. The committee agreed to accept the one £8,857 6s. 6d., provided sureties were forthcoming for the fulfilment of the contract. These were provided, the contract and bond prepared, and submitted to the committee for approval. Further, the clerk of works was engaged, the times at which I should visit the works, and the amount to be charged for journey for travelling expenses. You will see, then, that the reason you have stated is not the reason why I am set aside. What is it, then? You shall judge. When I was in Ryde the committee told me that Mr. Scott had been employed, and had been set aside for the same reason you state in my case; and that as soon as the advertisement appeared he sent them in his account, £700. They inquired if this was the usual charge, and if Mr. Scott could compel them to pay. I answered in the affirmative, unless, under the circumstances narrated, they could compromise the matter with him. Now I infer that the committee have not been successful in their negociations with Mr. Scott, and have come to the conclusion that it is easier to set me aside than a man in Mr. Scott's position. I do not so much find fault that they have gone back to Mr. Scott. He is undoubtedly entitled to the work; but the committee ought not to have put fifty-seven competitors to the needless trouble and expense of preparing elaborate drawings, and then pass them by.—I am, &c., W. PEACHEY.

LEGAL TENDERS.

SIR,—There was a building advertised to be let by tender, worded thus: "Tenders to be delivered on the 4th. Any tender after this date will not be accepted." My tender was the only one that was sent up to the date. There was, however, another sent on the 9th and accepted. I want to know if I cannot claim compensation for my tender.—I am, &c.,

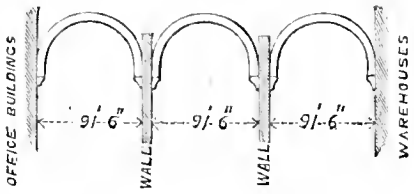
A CONSTANT READER.

Harrogate, June 23.

Intercommunication.

QUESTIONS.

[890.]—SEMICIRCULAR IRON ROOF.—I am designing a semicircular iron roof in three spans, and am at a loss for a formula to work it out. The transverse section will be thus:—



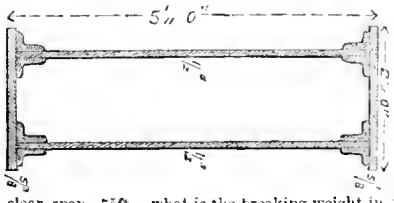
Will you kindly help me by stating my want in your "Intercommunication"? Also, will you say what, if any, advantage I may derive by having it in wood ribs, laminated, like the riding-school at Moscow?—A YOUNG ENGINEER.

[891.]—WIDENING AND DEEPENING A STREAM.—Can any of your readers assist me in the present case? I want to widen and deepen a stream for about a furlong in length. I want the extreme depth in the middle to be 5ft. 6in., and the breadth at bottom about 11ft. What kind of cross section ought I to give to it; and how shall I make the sides watertight?—MILLER.

[892.]—GEOLOGICAL SURVEY OF ENGLAND.—I should be obliged if you will let me know whether the geological survey of England is completed, and where I could obtain the maps. Also what towns are surveyed to the 1-500 scale?—INQUIRER.

[893.]—SPIRIT LEVEL.—Will you allow me to ask, through the medium of your "Intercommunication" column, what description of spirit level I had better buy? Some of my friends recommend the Y, some Gravalt's dumpy level, and others that of Troughton. I am quite puzzled by the different recommendations, and do not know which to go by.—A BEGINNER.

[894.]—BREAKING WEIGHT OF BOX GIRDERS.—Given a box girder, as in the cut—breadth, 2ft.; depth, 5ft.; thickness of plates, ⅝in.; angle irons, 3in. by 2½in. by ⅜in.;



and clear span, 75ft.—what is the breaking weight in the centre under a uniformly distributed load?—J. J

[895.]—A TAPERING ROOF. Will you, or any of your correspondents, be good enough to inform me of the best mode of roofing a building which in a length of 81ft. tapers from 25ft. 3in. to 21ft. 6in., so as to halve the ridge level? An architect has directed me to put the back wall off the level. I do not wish to do this, as both front and back are equally exposed, and each have a range of windows.—A BUILDER.

[896.]—WATERING THE STREETS.—A few months ago it was announced in the BUILDING NEWS that several of the Vestry Boards of London were about to water the streets with a solution of water and chloride of calcium, a mixture patented by a Mr. Cooper. Any information as to how it is answering, as well as the patentee's charge for royalty, would much oblige.—H. R.

[897.]—ARCS OF DIFFERENT RADII.—Having a long piece of wood, say ¾in. square, I want to form with it arcs of different radii. Could any of your readers inform me

if there is any rule by which the piece could be bent to form a true curve, A A being the width and B the height.—HOWELL.

[898.]—WELL DIGGING.—Will any of your readers inform me the price per foot deep for digging a well 30ft. deep and 4ft. diameter, everything found?—A. B. C.

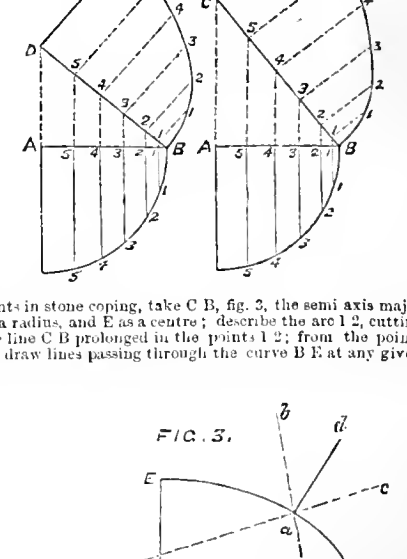
[899.]—QUERIES.—Will any of your subscribers be kind enough to tell me if it is usual to measure the portions occupied by enrichments when giving the girth of plaster cornices? and what sizes of wood are termed plank, and when does timber size commence? Also, if tar or asphalte will make the joints of glazed earthenware pipes watertight in exposed positions, which so frequently leak now when bedded in clay?—T. L. P.

REPLIES.

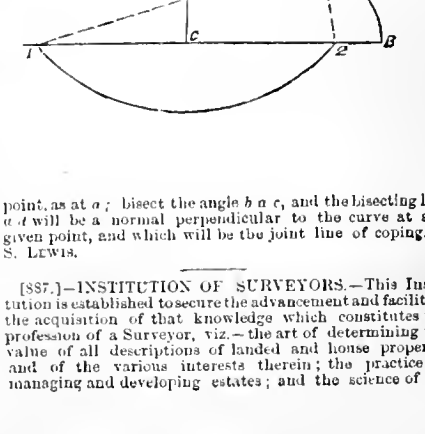
[831.]—WHITWORTH SCHOLARSHIPS.—The conditions attached to the competition for the Whitworth Scholarships are as follows:—All candidates must be English subjects, not above twenty-six years of age, and of sound bodily constitution. The examination will comprise elementary and the higher mathematics, practical plane and descriptive geometry, elementary mechanics, and mechanical and freehand drawing, physics, chemistry, including metallurgy. The candidate must also have a practical acquaintance with the ordinary tools of the workshops, and have worked at smith's work, turning, filing, and fitting, pattern making and moulding. It is proposed to make the greatest number of marks obtainable in the theoretical portion of the examination to equal the greatest number that can also be obtained in the practical part.—AN INTENDED CANDIDATE.

[831.] The conditions depend entirely upon the various local bodies to whom the nominations for the £25 exhibitions have been given. Some of these, we believe, intend to hold special examinations, others not. The Society of Arts will probably give the three scholarships entrusted to them to the students who have best distinguished themselves in the society's own examinations. For more accurate information "W. L." should apply to the institution or corporation holding the scholarship for which he intends to compete.—K.

[838.]—RAMPING TWIST AND JOINTS IN STONE COPING.—In reply to "Amateur Foreman," I have shown in the accompanying diagram, figs. 1 and 2, how they are worked out in two different heights, which I think he will see clearly without any further description. The figs. 1 1, 2 2, &c., apply as in the former diagram. To find the



joints in stone coping, take C B, fig. 2, the semi axis major as a radius, and E as a centre; describe the arc 1 2, cutting the line C B prolonged in the points 1 2; from the points 1 2 draw lines passing through the curve B E at any given



point, as at *a*; bisect the angle *b a c*, and the bisecting line *a d* will be a normal perpendicular to the curve at any given point, and which will be the joint line of coping.—S. LEWIS.

[887.]—INSTITUTION OF SURVEYORS.—This Institution is established to secure the advancement and facilitate the acquisition of that knowledge which constitutes the profession of a Surveyor, viz.—the art of determining the value of all descriptions of landed and house property, and of the various interests therein; the practice of managing and developing estates; and the science of ad-

measuring and delineating the physical features of the earth. Also to promote the general interests of the profession, and to maintain and extend its usefulness for the public advantage. The Institution consists of three classes, viz.—Members, Associates, and Honorary Members, with a class of Students attached. The following are the rates of contribution to the funds:—

	Annual Subscription.	Admission Fee
Student	£1 1 0	—
Associate	2 2 0 ...	£3 3 0
Member	3 3 0 ...	5 5 0

An Associate may compound for his annual subscription for twenty guineas, and a Member for thirty guineas. Country surveyors may become members.—A Member.

[888.]—Resistance of Stone to Frost.—A method was practised by Mr. Brad, and it is stated with success, to prove the above. It has, however, been spoken slightingly of by some; but it is the only method with which I am acquainted. The pieces of stone to be tested should be sawn into cubes of about three inches. A large quantity of Glauber's salt should be dissolved in hot water and then left to cool. This solution should be heated to boiling point in a saucepan, and in it the pieces of stone must be suspended for exactly half an hour. They are then to be removed and hung up over a vessel containing some of the above cold solution. In the course of twenty-four hours, if the air is not very damp or cold a white efflorescence will appear on the stones. Each piece must then be immersed in the liquor in the vessel beneath it till the crystals disappear, and again suspended. The dipping must be repeated whenever the dry efflorescence forms. According to their tendency to exfoliate by frost, the different stones will show in about five days alterations on the edges and angles of the cubes. The results may then be estimated by the weight of the disintegrated fragments compared with the known weight of the cube in its original state, both being taken equally dry.—Lapis.

WAGES MOVEMENT.

The operatives of Liverpool are henceforth to be doubly armed for their own protection against the combination of the masters, by turning capitalists themselves. An association, suggested by the circumstances of the strike, has just been formed, under the name of the "Co-operative Building Association, Limited." The capital is provided by 50,000 shares, of £1 each, of which 2s. 6d. is paid on application and 2s. 6d on allotment, and it is said that the project has been well taken up by the operatives in the building trade generally. Messrs. Duncan, Squarey, and Co. are the solicitors to the association, and among the promoters are Mr. James Samuelson and Mr Joseph Boult. The association has already undertaken several good contracts in Liverpool and the neighbourhood, and the enterprise is stated to give promise of very good success, many of the shares having been readily taken up.

BUILDING AND LAND SOCIETIES.

On Monday week, the fourth annual meeting of the Hanley Mechanics' Permanent Benefit Building Society was held at the Potteries Mechanics' Institution, Mr. William Stubbs presiding. From the report of the committee we learn that the society is capable of paying, in addition to the ordinary interest, a clear bonus of not less than 7 per cent. per annum on all investment shares. The current amount of applications for advances was stated to be greatly in excess of any previous year, and the position and prospects of the society were considered highly satisfactory.

LEGAL INTELLIGENCE.

Is Westminster Abbey a Royal Palace.—Mr. Poole, a mason, and Mr. Tyler, a builder, appeared before Mr. Arnold by their counsel to receive the judgment of the court in a summons taken out against them by Mr. James Tolley, district surveyor of St. Margaret, St. John, and St. Peter, Westminster, for neglecting and refusing to give him certain notices required under the act. Mr. Philbrick prosecuted; Mr. Vaughan Richards appeared for the defendants nominally, but in reality for the Dean and Chapter of Westminster. Mr. Arnold said—These were two summonses taken out by the district surveyor of the district of St. Margaret, St. John, and the close of the Collegiate Church of St. Peter, Westminster, complaining that the defendants, respectively the builders engaged in doing certain work in a building within the close of the Collegiate Church of St. Peter's, Westminster, did neglect to give to the complainant, as such district surveyor, two days before such work was commenced, due notice in writing, stating the situation, &c., of the building, &c., and the particulars of such proposed work, &c. These summonses were taken out under the 38th and 41st sections of the Metropolitan Building Act, which make it imperative on a builder to give such a notice and impose a penalty not exceeding £20 for neglecting to do so. The building under consideration is Westminster Abbey, and the question is whether that building comes within the operation of the Metropolitan Building Act. The defendants, or rather the Dean and Chapter of the Abbey, who, in fact, resist the application, contend that the abbey is, by the 6th section of the act, exempt from its operation, as being either "one of her Majesty's Royal Palaces," or a "building employed for her Majesty's use or service." The worthy magistrate then gave a lengthened and very interesting review of the facts, and said he felt bound to come to the conclusion that Westminster Abbey was not exempt from the operations of the Metropolitan Building Act, either as a Royal palace, or as a building employed for her Majesty's use or service, and consequently that the defendants were bound to give the notice required by section 38, and having failed to do so had incurred the penalty under section 41; but as the case had been brought into the court solely for the purpose of raising an important and curious question of law, he considered that a nominal penalty of 1s. in each case would be sufficient, and for the same reason he did not make an order as to costs. He was glad to see that under section 106 a power was given to the defendants to appeal to any of the superior courts of Westminster, and they would, of course, exercise it in the manner pointed out by section 107. Mr. Vaughan Richards thanked Mr. Arnold for the attention he had given the matter, and on behalf of the Dean and Chapter said he should avail himself of the 106th section to appeal.

Our Office Table.

The arrangements for the meeting of the British Association at Norwich are in a forward state. Among other papers will be read, by Mr. C. S. Read, M.P., and Mr. F. S. Corrance, M.P., on the "Progress of Agriculture and the Condition of the Labouring Classes;" and by Sir W. Jones and Mr. Harding, on the "Drainage of the Fens and the state of the Rivers of Norfolk."

The town surveyor of Northampton desires to make known the fact that the fourth crop of Italian rye grass grown this season will be cut in a day or two. Each crop has produced about twelve tons to the acre. The plot is generally flooded on Wednesday, and Mr. Pidcock, the surveyor, will give any information to anyone who may visit the works on that day.

A catastrophe to art has occurred at the Palace of the Luxembourg in Paris. The plaster-work of the fine dome of the library, painted by Eugene Delacroix, has fallen down, and broken to pieces. The fragments have been carefully taken up and conveyed to one of the studios of the Louvre, where Count de Nieuwerkerke is having them placed together again.

A meeting was held at Kennington, last week, at which Mr. Thomas Hughes, M.P., presided, for the purpose of obtaining an expression of the opinion of the people of Lambeth, on the proposed erection of a South London market in that locality, the private bill for which has passed both Houses of Parliament. A resolution approving of the scheme was proposed by Mr. Haddon, the architect of the market, seconded by Mr. Thomas Connolly, and carried with only one dissentient.

A novel sale took place at the auction rooms of Messrs. Debenham and Storr, in Garrick-street, on Monday. The rooms were hung round with ecclesiastical vestments of every description, and of the most costly character. There were copes, stoles, dalmatics, albs, tunicles, maniples, chasubles, cassocks, berettas, banners, and everything else required for carrying out in the most complete style the various offices of the Church. The novelty of the sale attracted a considerable number of clergy and laity, and good prices were realised for some of the articles more generally used.

The extensive premises occupied by the London (City) Baths, Laundries, and Dwellings Company (Limited), situated in Golden Lane, St. Luke's, are announced for sale by auction. This extensive establishment is said to have cost nearly £40,000, and was opened about three years ago. Should it be diverted from its present philanthropic purpose the deprivation will be severely felt in the neighbourhood.

We have received the following:—"I think it is now about four or five years ago that I first drew attention to Queen Anne architecture and furniture, with the result of bringing down the curses of Gothic indignations upon my head. To those who like myself believe that a square arched window is the want of the age, it will be a great pleasure to know that in the new houses now erecting in London, by Mr. P. Webb, he has developed a distinctly constructive square arched method of building.—Warrington Taylor."

The annual excursion of the Liverpool Architectural and Archæological Society will take place to-morrow. The excursionists will proceed to Wrexham, and then visit some of the most interesting parts of the neighbouring country.

Some doubts have arisen as to the effects of spreading large volumes of sewage over areas in the immediate vicinity of populous places. Norwood, with its irrigation area close to the inhabited district, during the three years that the system has been applied to the land has had a mortality of 18.17 per 1,000 in 1865; 15 13 in 1866; and 14 21 in 1867; while the same area, inclusive of more distant localities, has had during the same period the respective mortalities of 21.26, 20.04, and 16 60, so that it appears that in the rapid growth of the plant under cultivation the assimilation of nitrogenous and carbonaceous matter, and the elimination of large volumes of oxygen by the plan, we have the antidote for what might have been thought to prove baneful in its effects.

We see from the audited accounts of the Liverpool Architectural and Archæological Society that during the past year £4 4s. were spent in students' prizes, and £32 17s. 10d., in coffee, &c. We do not know what the "&c." means, but we suppose such things as biscuits and bread and butter. If the society, which in other respects is one of the most useful provincial societies in existence, would in future spend a little more in "students' prizes," and a little less in "coffee, &c.," their balance sheet would present a more creditable appearance.

We are requested to say that the circumstances alluded to in our last number, in reference to the new church at Ryde, are as follows:—Mr. Scott, on the first undertaking of the church more than two years ago, had been appointed the architect, though some members of the committee had desired to go to competition. He had made a design and working drawings, and building tenders had been received, which being higher in amount than the committee thought they could venture upon, the idea of competition was revived and carried. Against this the architect strongly protested, and has never been settled with as to his claims. The committee having subsequently disagreed with the architect whom they chose by competition, came to the unanimous resolution to ask Mr. Scott to resume his original position, which he only consented to do on being assured that the architect in question had been formally closed with before the idea of returning to him had come under consideration.

The first portion of the Bolingbroke Park property, Clapham Junction, having been entirely disposed of, the second took place on the 24th inst., at the offices of the Conservative Land Society, and a large sale thereof was effected. The competition for special plots was so great that as high as £50 was paid for a right of choice to secure priority of selection. Some notion of the high prices which suburban freehold land will fetch near a railway station is afforded, when it is stated that the 113 plots sold at the first allotment ranged in price from £58 up to £1,000 per plot, and plots on the second portion were sold from £58 up to £410 each.

The vestry of St. George's, Hanover-square, has at length determined to have a re-valuation of the whole of the property in the parish made for the purposes of the Poor Rate, in accordance with the act 6 and 7 William IV., cap. 96, and Mr. Charles Lee, of 3, Whitehall-place, has been appointed to make the same in time for the next rate. This is the largest and most wealthy of London parishes, and it has not been valued throughout for many years.

Baron Haussman, Prefect of Paris, has issued his report on the financial situation of the city. The report admits that since 1853, when Haussman became King of Paris, the enormous sum of 1,865,770,086f. (£74,603,803) has been spent in demolishing houses and building new streets on their sites, and that only 1,399,994,890f. have been paid, so that there remain due 465,775,196f. (£18,635,200).

On Wednesday the excavations at the Emporium Romanum on the banks of the Tiber brought to light a noble archæological and historic relic, in the shape of an enormous block of Carrara marble, measuring 585 cubic metres, and bearing a long inscription. The block was uncovered in the presence of the Senator of Rome and a number of distinguished persons.

The excavations which are being carried on at Pompeii have brought to light two fresco portraits situated under a portico of the Via Stabina. It is believed they represented the master and mistress of the house. The man wears a magistrate's toga; the woman is in the attitude of a person reflecting about what she is to write; for she has a stile in her right hand, and is about to carry it to her lips, while in her left she holds writing tablets. Both these portraits are well executed.

The Marquis of Townshend has presented a bill before the House of Lords to amend the Metropolis Local Management Acts. The bill, which is confined to one clause, simply proposes that every vestry or district board shall provide and maintain sufficient and proper steam or horse rollers for the purpose of levelling every street in which broken granite or flint has been laid for the making or repairing of the carriage way.

Yesterday, to-day, and to-morrow a *fête* is held at the Royal Botanical Gardens, Regent's Park, in aid of the building fund of the Female School of Art, which, under the management of Miss Louisa Gann, has long maintained a very good position among the art schools of London. We trust that the patronage of the Queen, and the combined attractions of the gardens and the bazaar will secure a large attendance, and a handsome result in a pecuniary point of view.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

3246 R. HEATHFIELD. IMPROVEMENTS IN MACHINERY FOR THE MANUFACTURE OF CUT NAILS. (A communication.) Dated November 15, 1867.

This improved mechanism consists, essentially, of a hollow cylinder having guides through which the nail plate or strip passes, the said hollow cylinder being carried by a table, or rest, or slide, and having a reciprocating rotary motion communicated to it (which motion is communicated to the nail plate or strip) substantially in the ways described and illustrated. Second, the invention consists in the combination with, or the adaptation to, the said turning over mechanism, of mechanism for feeding or advancing the nail plate or strip to the cutter, substantially in the manner described.—Patent completed.

3300 W. BLUNDELL. IMPROVEMENTS IN COWLS OR GUARDS FOR CHIMNEY, AND OTHER LIKE PURPOSES. Dated November 21, 1867.

The primary object of this invention is so to construct cowls or guards as to prevent all draught down the chimneys or shafts to which they are applied. The invention mainly consists in the employment of a conical cap, which, no matter how frequently the wind changes, always protects the chimney or shaft on the windward side, but allows free passage for the smoke on the leeward side. The conical cap is fitted or balanced on a spherical bearing or point ball and socket or other suitable joint on the top of a vertical rod carried up from the centre of a crossbar or frame at the upper part of the chimney or shaft, and the length of this rod, and the size of the cap, are so proportioned that the lower part of the cap comes on the windward side below the level of the top of the chimney when acted on by the wind. The cap being balanced on the top of the rod, the side of the cap acted upon by the wind is forced against the side of the chimney, thereby preventing the wind getting down the chimney, or by the pressure of its velocity hindering rapid discharge from the orifice of the chimney, while the opposite side of the cap at the same time rises, leaving an ample opening at the top of the chimney for the egress of smoke.—Patent completed.

3305 H. JAMES and E. DREWETT. IMPROVEMENTS IN WATERCLOSETS. Dated November 21, 1867.

In waterclosets as at present constructed, the pan is necessarily open at the top when the valve at the bottom of the pan is open, and, consequently, an escape of foul air results from the opening of the valve. Now, according to this invention the patentees arrange the handle, by which the valve of the pan is opened, at one side of the closet, so that it can be acted on when the flap or lid which closes the pan is shut down air-tight, and so as to prevent the escape of any foul gases. In order that the flaps or lids may close perfectly air-tight, an india-rubber seating is provided. Also, according to the invention, immediately under the seat of the closet, and fitting closely to it, and around the pan, they arrange a trough for containing disinfecting material, which at once deodorises any gases which may issue from the pan on the opening of the valve. Also they ventilate this trough, which, when the flap or lid is shut, forms an enclosed chamber by means of inlet and outlet air pipes, one or both of which may be fitted with valves in connection with the flap or lid, so that when the flap or lid is open, and the closet in use, the air-pipe or pipes may be closed, but, when the flap or lid is shut down, the air-valve or valves are open to ensure the thorough ventilation of the enclosed chamber around the pan.—Patent completed.

3311 A. MUNRO. IMPROVEMENTS IN BORING OR CUTTING ROCKS, STONES, &c. Dated November 22, 1867.

This invention relates to an improved tool to be used for cutting rocks or other similar substances in mining and engineering operations, and in hewing or cutting stone for building and other structural purposes, and it consists in the application of chilled cast iron, or iron compounded with other substances as the material of which the tool themselves are made. The tool consist of flat discs, with the edge bevelled, or of a bell-mouth shape, so that a sharp or cutting side is left all round them; the tools are retained in holders fixed to the boring head of a boring or cutting machine, and they are manufactured by running cast iron into properly shaped drills in the ordinary manner. In place of forming the tools of a disc shape, they may be made oblong with round or semicircular ends. They may also be made of an elliptical, angular, or other form, a dovetail or other shaped projection being formed on the back for retaining them in the holder.—Patent completed.

3319 W. BOULTON. AN IMPROVED METHOD OF TRANSMITTING MOTIVE POWER TO POTTERS' WHEELS, LATHES, AND OTHER SIMILAR MACHINERY FOR THE MANUFACTURE OF POTTERY. Dated November 23, 1867.

This invention consists, principally, in an endless band (made of cotton, hemp, india rubber, or any other suitable material), to be driven from a grooved or other pulley in either a horizontal, vertical, or oblique position, as may be best suited for the machine to be driven, and to be direct-acting without the aid of discs or long shafting, and to have a number of potters' wheels, lathes, jiggers, or other machines in connection with the making of pottery at one and the same time, and so that the speed of any or all of them can be varied at pleasure, or reversed, and, in order to accomplish this, the patentee takes the belt from the first driving pulley in the most convenient manner, and passes it near to a grooved pulley in connection with the machine to be driven. He then fixes a small friction pulley attached to a lever or treadle, or any other convenient appliance, and, when the machine is required to move or revolve, the friction pulley is caused to bring the belt in contact with the driving pulley, and when the speed is required to be reduced, the belt is partially removed from the driving pulley in order to allow a little slipping, or a hand wheel or brake may be attached, in order to vary the speed, or the belt may be removed to another pulley of a larger size by a lever, treadle, or other convenient arrangement. If the motion is required to be reversed he moves the belt to the contrary side of the pulley, or brings the return belt in contact with another pulley on the same shaft or spindle. By this means the reversed motion can be varied in speed according to the size of the second pulley. In order to keep the belt at an uniform tension he introduces a balance or tightening weight that will move with the variation of the belt.—Patent completed.

Trade News.

TENDERS.

BRACKLEY.—For building a new Parsonage House, for the Rev. L. H. Thicknesse. Mr. C. Buckeridge, architect. Quantities supplied by Mr. Tanner:—

Dover	£3240	0	0
Baker	3227	0	0
Franklin	3165	0	9
Kimberley	3000	0	0
Davis	2995	0	0
Hedges	2991	10	0
Selby	2976	0	0
Orchard	2897	0	0
Claridge	2896	0	0

BRIGHTON.—For alterations and new front at No. 41, Western-road. Mr. Tuppen, architect:—

Anscombe and Newnham	£485
Lockyer	435
Bruton	375
Kemp (accepted)	354

ESSEX.—For building St. Mary's Church, Mistley, Essex. Messrs. Wadmore and Baker, architects. Quantities by Messrs. Goodman and Vmall:—

	Cost of Church.		Additional for Spire.
Runnacles, Halstead, Essex	£5899	...	£1238
Mansfield and Price, London	5620	...	850
Patman and Fotheringham, London	5550	...	850
Dove Brothers, London	5500	...	820
E. Gibbons, Ipswich	5300	...	1040
G. Myers and Sons, London	5250	...	785
Grimes, Colchester	5260	...	1056
Saunders and Son, Dedham, Essex	4950	...	970
Luff, Ipswich	4361	...	1028
Hawkins, Monk's Eleigh, Essex	4307	...	789
Holland, Sudbury, Suffolk	4322	..	789

HAYWARD'S HEATH.—For erecting house, offices, and stable at Hayward's Heath, for Mr. Thos. Bannister. Quantities supplied by Mr. Henry W. Broadbridge:—

	House.		Stables.		Total	
Rowland and Aldridge	£1190	...	£415	0 ...	£1605	0
Hall	1170	...	415	0 ...	1585	0

Myers and Sons	5970 ...	395

LONDON.—For rebuilding No. 1, Wood street, Cheapside, E.C., with portland stone front. Herbert Ford, architect. Quantities supplied by Messrs. Hovenden and Heath:—

Webb and Sons	£3743
Lawrence and Sons	3732
Ashby and Sons	3732
Myers and Sons	3712
Browne and Robinson	3687
Henshaw	3576
Conder	3509
Piper and Wheeler	3365
Pritchard	3313
Brass (accepted)	3274

PENGE.—For new hotel and four houses adjoining, at Penge, Surrey. Mr. Henry M'Calla, architect. Quantities furnished by Messrs. Leaning and Nicoll, 1, Guildhall Chambers, E.C.:—

Fish	£5526
Lidbetter	5045
Elhingham	4681
Little	4658
Browne and Robinson	4573
Killby	4493
King and Sons	4350

WILMSLOW (Cheshire.)—For Parish Schools. Medland and Taylor, architects. Quantities by Mr. H. Breary:—

Thompson	£2446
Robinson and Son	2000
Hawe	1995
Warham	1968
Lane	1960

WITHINGTON (Lancashire).—For enlargement of Withington Parish Schools. Medland and Taylor, architects:—

Hoyland	£812	10	
Clark	785	0	
Dawes	778	0	
Darnborough	738	0	

WOOLWICH.—For alterations, additional offices, &c., to Townhall, Woolwich:—

Vickery	£197	0	
Lorrigan	175	0	
Williams	152	19	
Bloom	150	0	
Woodford	138	0	

COMPETITIONS.

ABERGAVENNY, MONMOUTHSHIRE.—July 7. Designs, plans, &c., new townhall, corn exchange offices; also for reconstruction of a general market place and erection of public slaughter houses. Premiums, £50, £20, and £10. J. T. Rutherford, clerk to company.

HERTFORD COTTAGE PRIZE COMPETITION.—September 1.—Design for model cottages for agricultural labourers. Premium £50. R. Dimsdale, Esq., M.P., 9, Queen-square, Westminster.

INDIA OFFICE.—Forty appointments in Engineer establishment of India, open to competition in July next. Application to Under Secretary of State for India, India Office, S.W.

LIVERPOOL.—July 1.—Plans for the conversion of property in Redcross street, Strand-street, &c. Griffith Davies, Esq., manager and secretary, Liverpool Financial Association (Limited), 32, Castle street.

LIVERPOOL.—July 21.—For plans and specifications for erection of new hospital on the site of present Everton Hospital for Infectious Diseases. Mr. J. J. Still, 17, Water-street.

SCARBOROUGH, YORKSHIRE.—Designs, plans, and estimates for new pier. Premiums, £50 and £30. W. E. Woodall, secretary to Commissioners, Queen street, Scarborough.

ST. MARYLEBONE.—July 7.—For particulars or information of any site suitable for public baths and washhouses. Mr. Foot, clerk to the commissioners.

CONTRACTS OPEN FOR BUILDING ESTIMATES.

ALDERSHOT.—July 11.—For painting, paper hanging, &c., at Cavalry Barracks. Royal Engineer Office, Aldershot.

BELFAST.—June 28.—For a turret clock. J. Guthrie, town clerk, Townhall.

BROMFIELD (SHEFFIELD).—July 14.—For the erection of the new church of St. Mark. W. H. Crossland, architect, 21, Park square, Leeds.

WAR DEPARTMENT.—Netley, Southampton.—For external painting, colouring, &c. W. C. Hadden, Colonel-Commanding, Royal Engineer Office, Portsmouth.

CARMARTHEN.—June 30.—For building St. Peter's School Church. Rev. Latimer Jones, Vicarage.

For completing a gap in a wall about 10,000 yards. Johnson and Raper, solicitors, Chichester.

ANGLESEY UNION.—July 6.—For the erection of new workhouse, infirmaries, &c. Plans, &c., Mr. R. G. Thomas Menai Bridge.

BLACKHEATH.—For the erection of two semi-detached villas at the Manorway. Mr. Moreing, 11, Carlton street, Waterloo-place.

STOGURSEY, NEAR BRIDGEWATER.—June 29.—For the erection of a vicarage house. Mr. J. Norton, architect, 24, Old Bond-street, W.

BROMLEY-BY-BOW.—July 10.—For the erection of a chapel in Devon's-road. Messrs. Hovenden and Heath, 181, Bishopsgate-street Without.

June 30.—For the erection of a country residence. J. P. Spencer, architect, Wantage.

HURSTPIERPOINT, SUSSEX.—July 7.—For the erection of national schools. Messrs. Goulty and Gibbins, architects, 12, Union-street, Ship-street, Brighton, and 40, Torrington square, London.

METROPOLITAN BOARD OF WORKS.—July 4.—For draining, forming paths, mounds, &c., in Finsbury Park. J. Pollard, clerk to the Board of Works, Spring Gardens.

ASTON UNION.—For erection of new workhouse at Erdington. Mr. G. Thomason, architect, Wellington chambers, Bennett's hill, Birmingham.

HEREFORD.—July 11.—For taking down and rebuilding St. Andrew's Church. Architect, Mr. J. Johnson, 35, Moorgate street, E.C.

NEWCASTLE-ON-TYNE.—June 29.—For erection of a new drill shed. Thomas Oliver, F.R.I.B.A., architect.

ROYAL ARSENAL, WOOLWICH.—August 1.—For supplying and depositing dry rubbish or dredger stuff on the foreshore. Inspector of Works, Royal Arsenal.

BRIGHTON.—For the erection of married soldiers' quarters and boundary wall. J. S. Robertson, Royal Engineers' office.

ST. LUKE, MIDDLESEX.—June 30.—For the jobbing work of the parish. Messrs. Parsons and Hayne, Vestry Hall, City-road.

June 30.—For the construction of new brick and pipe sewers. J. Douglas, 10, New-end, Hampstead.

For the erection of four iron and brick, and two brick bridges. J. B. Badock, 7, Staple-inn.

LEEDS.—July 11.—For the construction of offices at London and North-Western Central Station. H. Morgan, Esq., London road station, Manchester.

ST. ALBAN'S.—July 1.—For the erection of St. Peter's church. Mr. T. Hill, 14, Bedford row.

MERTON SEPARATE DRAINAGE DISTRICT.—July 6.—For the execution of about 550 yards of outfall sewer. Mr. B. Latham, 6, Westminster-chambers, Victoria street.

July 8.—For the erection of about 1,200 feet of enclosure walls, iron gates, &c., at Hampstead. W. F. Jebb, 37, Norfolk-street, Strand.

TWICKENHAM.—July 10.—For removal of dust, ashes, and other refuse. Surveyor, Local Board of Health, Twickenham.

NORTHAMPTON.—July 1.—For the erection of a dwelling house. Messrs. Godwin and Crisp, 197, Albany-street, Regent's park.

BRIGHTON.—July 9.—For the erection of two new groynes, &c., in front of the Marine Parade. Mr. P. C. Lockwood, Townhall.

CITY OF PEST.—July 31.—For excavating trenches, laying the pipes, and making them entirely watertight. Hon Moritz von Szentkirályi, Ober Burgermeister, President, City Waterworks Company, Pest.

DARLASTON.—July 3rd.—For the erection of new schools, in connection with the Parish Church. James Slater, Hon. Sec. to the Committee.

STOURBRIDGE.—July 16th.—For the erection of a new church at Stamber Mill, near Stourbridge. Thomas Smith, architect, the Mount, Stourbridge.

WAR DEPARTMENT.—For painting, &c., at Pimlico, Millbank, and other places in London. Lieutenant Colonel E. B. Ewart, Royal Engineer Office, St. James-street, Buckingham-gate.

CHESHIRE NEW COUNTY ASYLUM.—July 27.—For the erection of Cheshire New County Asylum. R. Griffiths, architect, 3, Martin street, Stafford.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

Henry Colton, Stratford, Essex carpenter, July 9, at 11—John Evans, York-street, Barking-road, builder, July 15, at 12—John William Sanders and William Alfred Saoders, Guildford street, Gray's Inn-road, builders, July 6, at 11—Thomas M'Mahon, Sidney place, Notting Hill, builder, July 1, at 2—William Munro, South Sea House, City, railway contractor, July 6.

TO SURRENDER IN THE COUNTRY.

William Evans, Llandudno, builder, July 6, at 12—Griffith Griffiths, Llandudno, builder, July 6, at 12—Albert James Hart, Thorrington, Essex, carpenter, July 4, at 12—David Higginbotham, Bradford, Yorkshire, plumber, July 7, at 9.15—Edmund Hughes, Bedwardine, Worcestershire, builder, July 8, at 12—Frederick Woodward, Swindon, Wilts, builder, July 4, at 11—Henry Spunk, Swineshead, Lincolnshire, builder, July 1, at 10—William Thompson, Darlington, sawyer, July 3, at 10.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

July 16, H. J. Barnes, Little Chester-street, Pimlico, builder—July 16, G. H. Read, Old Kent road, jobbing builder—July 13, J. Eve, Maidstone, builder—July 16, G. Newton, Notting-Hill, builder—July 20, J. J. Sibley, Yorkgrove, Peckham, surveyor—July 23, T. Cross, Croydon, carpenter—August 4, J. Raby, East Ham, building contractor—July 21, F. H. Green, Merrick-road, Battersea, builder—July 21, H. Bagge, Speldhurst road, South Hackney, builder—July 10, A. Ormerod, Heaton Norris, joiner—July 3, J. Griffiths, Liverpool, slater—July 15, S. L. Tindel, Reading, engineer—July 22, E. B. Herbert, Leicester, builder—July 31, H. Eyers, Portsea, plumber—July 9, W. Lawrance, Penge, builder—July 13, A. Best, Bolton, engineer—July 15, G. Reece, Harborne, Staffordshire, painter and glazier—July 15, J. Ross, Birmingham, engineer—July 24, L. Worrall and T. Hargreaves, Wathupon-Dearne, builders—July 6, T. E. Glenister, Bovingdon, builder—July 23, H. Newton, Chesterfield, joiner.

PARTNERSHIP DISSOLVED.

Dean and Yeoman, York, architects.

DIVIDENDS.

July 15, W. Stevenson, Wednesbury, builder—July 10, G. B. Ramsay, Smethwick, builder—July 1, J. Pearson, Repton, brickmaker—June 30, H. Barrett, Bradford, painter.

THE BUILDING NEWS.

LONDON, FRIDAY, JULY 3, 1868.

NATIONAL EXHIBITION OF WORKS OF ART AT LEEDS.

Third Notice.

SPANISH PAINTING.

THE history of Spanish painting is emphatically the history of her politics and religion, for in it is written the record of the two great influences which were always at work upon her rulers, and from Rome or Flanders sprang every action of this once great country. Her art history betokens this in all its early works, and until the united pressure of these two opposing countries had forced into existence a school of her own, the art of Spain had two distinct phases. Of her earliest efforts we have no exhibition here; indeed, as we have noticed in our first review of this collection, the early art essays of the various schools are, as a rule, wanting at Leeds.

In the exposition of Spanish art the names of Sanchez de Castro, Nuñez, and Gallegos, with their followers, are missing, and the earliest name we find is that of Luiz Morales, who lived in the early part of the sixteenth century. Attributed to this artist are two works here, but we doubt if either of them belongs to him. Until attention had been of late years called to the early artists of Spain every head of Christ which did not offer a pretext to be deemed a Murillo was as a sort of natural consequence conceived to be a Morales, and thus it is that so many works of opposite character bear this artist's name, confusing his work and rendering it somewhat difficult to judge of that which he really did. There is here (43) a "Head of Christ at the Pillar," attributed to him, which is undoubtedly an early Spanish work, and bears upon it the impress of that love of severe and painful emotion which is so pre-eminently manifest throughout the whole course of Spanish art. It is an attractive painting from its representation of human suffering; the contracted eyebrows, the lacerated brows, and the bruised and scourged shoulders tell of human agony, but there is nothing here which would warrant the artist's title to that soubriquet of "El Divino" which distinguished him. Nor is the other work which bears his name, (82) "Our Saviour with Simon of Cyrene," more like his work: it is of a much later period and is far more Italian than Spanish in feeling, and is wanting in that Flemish character which is so visible in the works of Morales. A fine specimen of the influence of Italian art upon that of Spain is found in No. 358a. in the second edition of the catalogue, entitled "Franciscans adoring Christ;" the correct title should be "Dominicans embracing Christ." It is by a painter scarcely known out of his native city, Valencia—Juan Juanes, a painter who visited Rome and studied well the works of Raphael there, and who in doing so seems to have imbued himself with those earlier masters whom Raphael himself loved so well and learned so much from. The tender, loving treatment of the picture might be Angelico's, whilst the technical rendering is that of Raphael, and the reverent air with which the followers of St. Domenic embrace their Lord is, as a symbol of their profession, winning in the extreme, filling us with regret that we know so little of an artist who shows himself so good. By Alonzo Coello—not the Coello of a century later, and therefore more known, but that Coello whom Philip the Second called the Portuguese Titian, and to whom he addressed his letters as *Al muy amado hijo Alonzo Sanchez Coel o* "To my beloved son Alonzo Sanchez Coello"—we have good and interesting portraits here. By him are "Isabel de Valois" and "Anne of Austria," who succeeded our Queen Mary "of bloudie memorie," as it was once the fashion to call her, in the affections of Philip of Spain, whose natural brother, the brave Don John of Austria, the victor of Lepanto in 1571 and the aspirant to the hand of the unfortunate Mary Queen of Scotts, is here also represented by him.

His pupil, Pantoja d la Cruz, is represented by three portraits, each of these of Margaret of Austria, the wife of Philip III. To the costume of 432, where the ornamentation of her robe is composed of the heraldic bearings of Castille, Leon, and Austria, and a complex monogram of her own and her husband's initials, we commend the attention of those interested in the arts of design, and the antiquary rather than the artist will the more admire his works.

Of Juan Fernandez Navarette, who from his being deaf and dumb acquired the title of "El Mudo," we have an interesting specimen, (330) his own portrait. Dark and gipsy-like of visage—really Bohemian—the eyes of this picture tell of its author's infirmity, for never have we seen the watching, wistful look which is so painfully the characteristic of those whose eyes have thus to do treble duty so truthfully rendered, and the face is one which haunts our memory. The designation of El Mudo is, however, not confined alone to him—for strangely, two other Spanish artists are known by this record of their infirmity, namely, Diego Lopez and Pedro el Mudo, neither of whom, however, equalled Navarette, who was largely employed by Philip II. in decorating the Escurial and whose epitaph was written by Lope de Vega.* About the middle of the last half of the sixteenth century, Spanish art received a notable accession in the person of Theotocopuli—a Greek by birth, but who had settled at Venice, and where, it is said, he was employed by Titian to engrave his pictures. He was not only an admirable painter, but was also an architect, and designed the Casa de Ayuntamiento at Toledo, where he lived. By him we have a beautiful portrait of his still more beautiful daughter (325), whose graceful Hellenic features greet us from under a white hood, which enhances the soft carnations of her face, and adds to the charm of one of the most pleasing portraits in the exhibition. Attributed to "El Greco," for, from his native country, he is generally so called, is a dark uninteresting portrait of Pompeio Leoni—a sculptor, and the son of a sculptor, both of whom were extensively employed by that Augustus of Spain, Philip II.

Juan del Roelas, the artist prebend of Olivares, whence his cognomen of El Clérigo, is also represented by his own portrait (328), and from his contemporary, Juan del Castillo, the master of Murillo and Cano, we have an oblong canvas (373), containing the heads of St. Augustine, St. Domenic, and St. Jerome, broadly painted, but not of remarkable merit. By Zuraban, Roelas' pupil, and contemporary of Velasquez, we have a fine figure of St. Justa, once the potter's daughter in, now the patron saint of, Seville (356). This is well and broadly painted, and she bears in her hand those *alcarazzas* or water jars which her refusal to sell for Pagan purposes led to her martyrdom; but far the finest specimen of this master is the noble "Annunciation" (2,933 in the Dudley Gallery. Gabriel the Archangel kneels before the Blessed Virgin, and announces his heavenly mission, which she "full of grace" receives with that humility so beautifully told in her "Magnificat," whilst from a choir of cherubs the Spirit of the Lord descends upon her. Beautiful in conception and colour, this is one of the finest examples of Zuraban we have ever seen.

We have now reached the palmy days of Spanish painting, the days of Velasquez, who is represented here by no less than thirteen examples, chiefly, however, portraits. Of his higher efforts in historical and religious painting, by which we could read his mind and study his grouping and composition, we have scarcely anything. Amongst his portraits we find an interesting one of that powerful statesman, the Count Duke Olivarez, to whose political fame may be added the glory of being the first to befriend the young Sevillian, to receive him into his own house, and to introduce him to the King. Two other works of his present to us his royal patron and his wife,—or rather, as regards the Queen, a copy from the work of her tirewoman, who had been long engaged with her brush upon her most Christian Majesty's face, before Velasquez took up his, and well may Madame d'Aulnoy say "I never saw a crayfish of a finer red," so rouged is she. Velasquez evidently didn't like the work of copying, and the painting is an inferior one. There is a fine head of Don John of Austria,—not the Don John above referred to as the natural brother of Philip the Second, but Don John, the natural son of Philip IV. by the beautiful actress Maria Calderona; indeed, it is somewhat surprising to see in so conventional a country as Spain then was, what a large amount of naturistic feeling existed. There must be much of his mother's beauty in this upturned young face, and, as a specimen of Velasquez' mode of painting, it is highly interesting, but his brightest bit of colour here is seen in No. 336, "A sleeping peasant boy," which is extremely luminous. His technical handiwork is admirably set forth in a wonderful study of a mastiff's head (No. 341), where each dexterous turn of the brush reveals a power of representation and an amount of observation perfectly wonderful, meriting the remark of Sir Edwin Landseer, "I never saw so much large art on so small a scale," a remark made not of this picture, but of the boar hunt in the National Gallery, for some of the dogs in which this was probably a study. Of the grouping of Velasquez, we have one original specimen, and a copy we shall refer to bye and bye. This single specimen of his own composition is a representation of the miracle of St. Anthony (316), when the Saint restores the fishes he takes from the cook's plate to life and the water. The figure of St. Anthony is very nobly conceived, but the picture is not one of the best specimens of this master. His better arrangement of a subject is seen in the copy we refer to—a copy having, strange to say, a great and distinctive merit—it is the work of John Philip, our recently lost great painter of Spanish subjects; and still more strange to say, being a good picture and valuable in art history, it was bought for a long price by the Royal Academy. The subject is the celebrated "Las Meninas," or the maids of honour—the last work of note which he did, and in which Velasquez' own portrait occurs. It was this work which made him Don Diego—for on its being exhibited to the King, the artist demanded if it wanted anything further to please his Majesty! Yes, replied the monarch—this; and, taking a brush from the hand of Velasquez, he, with his own, painted, on the breast of the artist's portrait, the bright red cross of Santiago, "the highest honour of Castille and Spain." It was all very well for a King to do this, but though the King could make a noble yet he could not make grandfathers, and, as Velasquez had not quite enough of them according to the rule of the order, he had to wait till the Pope supplied the deficiency by a dispensation, and was not formally invested till three years after.

Another interesting copy of this master, by Philips, is the portrait of Alonzo Cano, the fellow pupil of Murillo and Velasquez, distinguished equally as a sculptor, a painter, and a hater of the Jews. It is a fine, squarely-painted, impetuous-looking head, and the touch of Velasquez is wonderfully imitated in it.

Of Cano's work in painting we have a

* No quiso el ciel que hablase
Porque con mi entendimiento
Diese mayor sentimiento,
A las cosas que pintase
Y tanta vida les di
Con el pincel singular,
Que como no pud? hablar,
Hice que hablasen por mi.

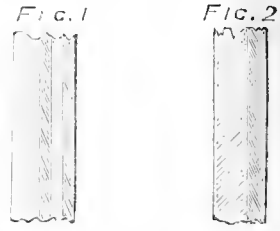
glorious "Assumption," in No. 95. Simply posed, almost statuesque, the Virgin ascends to heaven, the moon under her feet, and surrounded by rays of heavenly light, with a crown of stars about her head, represented in a most wonderful manner, showing great knowledge of both form and colour. Another very fine painting here, (358) "St. Theresa penetrated by Divine Love," is attributed to him, but is unlike him in sentiment. The expression of the face of the saint is very admirable, and the hands are beautifully painted; but a little Cupid, with a red-hot arrow, is scarcely the way of symbolising Divine love the painter of the poetic Assumption would have chosen. To Murillo upwards of twenty works are ascribed here, and a large part of them we are inclined to think original. First in the catalogue we find Mr. Staniforth's "Holy Family," a picture well-known by Boydell's engraving, and full of exquisite pathos. St. Joseph brings his infant Lord to His mother, who is seated on the ground beside His cradle, and the loving manner in which He stretches out His hands towards her is childlike and pure in the extreme. The weakest point in the picture is the figure of the Blessed Virgin herself, which is not equal to Murillo's usual conception. Lord Warwick's "Laughing Boy" (329) is not a good specimen of the master; the drawing is admirable, and the foreshortening of the hand pointing out from the picture is wonderful in drawing, but the difficult expression which decides the point between laughing and crying is not well caught, and it lacks the full rich *impasto* of Murillo's best work. The finest example here is one of unusual brilliancy and merit: it is a large picture, and will be found in the Dudley Gallery (2,901). This is the death of Santa Clara, painted for the Franciscan convent of Seville, about the year 1644, and consequently an early work of the master. It is pure as a Greek bas-relief in its arrangement, and from its admirable architectonic character of great decorative quality. On a pallet, surrounded by her dark-clothed brothers and sisters of the Franciscan order, lies the dying saint, the foundress of the "Poor Clares" of to-day, her face radiant with the light of that Vision she saw, and which Murillo has demonstrated to our eyes; for, attended by white-robed saints, our Lord and His Mother come to receive her parting spirit, and, as her soul leaves its earthly tenement, angels spread upon her bed the mantle brought from heaven as a token of their visit. The contrast between the dark earthly side, where Death reigns triumphant, and the etherial beauty of the one leading to Life Eternal is poetic in the extreme, and, saving that the artist found his hand stayed and his power fail him when he essayed to portray the features of his Redeemer, the work is perfect. In this portion of the exhibition will also be found Lord Dudley's exquisite St. John and the Lamb, from the Salamanca collection, a work of world-wide and well-merited fame. That Murillo could paint the seen as well as the unseen world, Lord Godolphin's "Beggar Boys" (383), and Lord Dudley's "Old Gipsy Woman" (2,926), show, and if further proof were needed, we could point to the five pictures forming a portion of the series of the Prodigal Son (2,917-2,921), where the parable is told with all the force of the vernacular, being related as incidents in the life of a young man of Murillo's own time. The sixth of this series was presented to the Pope by the King of Spain, and is now in the Vatican, but there is a replica of it in England, in the gallery of Stafford House, and if not too late we should still be glad to see it here, in juxtaposition to these other chapters in this history. Perhaps the most interesting work from Murillo's hand is his own portrait, taken shortly after his recovery from an accidental fall from a scaffold whilst painting the large picture of the espousals of St. Catharine, over the altar of the Capuchins there. It (324) presents to us a thoughtful face, sallow, and still bearing traces of recent illness, and, as it looks out to us from its frame surrounded by the implements of the craft he loved, we feel that the portrait of a man not only great but good is before us, and we can understand his works the better from having seen it. His St. Francis (348) and his St. Anthony (362) are admirable specimens of his work, but the other contributions are many of them very doubtful, some of them poor copies, and some of them too bad for that. With Murillo ends the exhibition of the Spanish school of painting, and we have not the pain, as in the Italian school, of seeing the struggles of its decadence. It is a school short in duration, but very vigorous whilst it lived, and one which impressed itself strongly on the artists who laid the foundations of our own. Indeed, it is somewhat singular that one of the earliest painters we read of as working in England was Petrus de Hispania, who wrought at Westminster in 1253, and the later schools of Spanish reacted on those of the Netherlands, and thus greatly influenced the establishment of our own.

ZINC AS A CONSTRUCTIVE MATERIAL.—II.

FROM what has been previously stated, it is evident that in order to prevent the accumulation and subsequent growth of vegetation upon the bottoms of vessels, it is indispensable that the sheathing should be susceptible of gradual dissolution in the water. The whole theory of the arrangement depends upon this preliminary proviso, and vessels can be covered with both copper and zinc in accordance with its dictates. Where the former material is employed, the iron outer skin of the vessel is first covered with a preparatory coating of some non-conducting mastic or varnish. Over this is laid a thin layer of sheet lead, which receives the copper sheathing. There are therefore no less than four outside layers, including the iron skin, as represented in the section in the cut. By these means the copper is completely isolated from the iron, and behaves itself in the water as laid down by the theory. This method has been advantageously applied to armour-plated vessels in the French navy, and has arrested the corrosion of the plates. Theoretically regarded, this system of sheathing leaves nothing to be desired, but in practice there is room for doubt. Omitting the question of cost, which, it is needless to say, is excessive, let us examine a little into the construction. A glance at fig. 1 will show that the copper is separated from the iron by two thin coatings, one of a metallic and the other of a resinous description. So long as the separation or discontinuity of the two dissimilar metals is preserved, so long does the arrangement continue perfect, but if by any sudden shock or violent concussion the insulation be broken through, if the smallest rent, or even a mere line of communication, be established between the iron and the copper, a galvanic action is at once set up. Of all examples of construction a ship of war is the last one we would select as likely to be free from the effects of impactive force. The intercommunication once effected, the copper becomes the electro-positive and the iron the electro-negative element, and the corrosion and destruction of the latter proceeds with all the rapidity and vehemence characterising all operations of an electrical character. Beyond the loss of the metal, and the cost of repairs the corrosion of the iron plates would not signify, provided the vessel was built of wood, but if she were altogether of iron it might lead to dangerous consequences in the shape of serious leaks. The cost of sheathing a vessel in the manner described is reckoned at about £3 the square yard, and six years may be fairly taken as the period it will last without renewal.

The theoretical conditions governing the sheathing of vessels are equally well fulfilled when zinc is the metal chosen as with the preceding material. Fig. 2 represents a section of the zinc sheathing over an iron skin or plate, and we at once perceive that the construction is much simpler than that of fig. 1.

FIG. 1 FIG. 2



Instead of four, only two layers are required, and, contrary to what is necessary in the case of copper, they must be in contact instead of being insulated. Moreover, the zinc sheathing need not be watertight; in fact, the reverse must take place, and the iron come into contact with the water in order that the current may be established. The action is very simple. The zinc becomes positive with respect to the iron, and is slowly dissolved, while the other metal remains intact. The price of bottoming a vessel by this method is about 12s. the square yard; and if the thickness be ⅛in. the metal will last about the same time as copper. This method of utilising zinc is due to M. Daft, who tested the principle at Portsmouth by immersing in sea water for a period of a year and a half a number of iron sheets coated with zinc. These sheets were subsequently raised out of the water in the presence of an Admiralty commission, and were found to be altogether free from every trace of marine vegetation. It was in consequence of the undoubted success attending this prolonged experiment that it has been determined to apply the process of zinc sheathing to some of the iron ships in our own navy. The annual expense per ton incurred by zinc bottoming may be put at about 3s. 5d., while the cost is exactly double when copper is the material employed. A difference in the annual expense must be noted accordingly as the vessel is built of timber or iron. A vessel that is built of wood will exceed in annual cost one that is built of iron by 25 to 30 per cent., as the zinc sheathing is not affected under the most favourable circumstances. It must be borne in mind that the annual cost, or what amounts to the same, the annual wear and tear, of the zinc sheathing is independent of the number of voyages, or of the work done by the vessel. The operation of dissolution proceeds equally as fast in the harbour as in the open sea, and forms a powerful inducement to the owners of vessels to abridge their stay in port as much as possible by employing every means to facilitate the unloading and reloading of their cargo, and also to reduce the length of each voyage to a minimum, so as to obtain the maximum number in the same year. There is scarcely any nation, if we except our own, which has a sufficient number of dry docks to accommodate its commerce, and vessels requiring to be docked have frequently to wait some time before they can get in, owing to the place being occupied by a previous tenant. An iron vessel, zinc bottomed, which requires to be docked only once in about six years, enjoys an immense advantage over its neighbours, which have to undergo the operation three or four times during the same period.

For roofing purposes zinc has been in use now for some years, and it unquestionably possesses the merits of lightness and cheapness. All metallic roof coverings enable a much lighter description of framework or trussing to be employed than with slates or tiles. An exception must be made in the case of cast-iron sheet roofing, which was applied to the Houses of Parliament, although the exact object of selecting it in preference to a lighter material is not quite evident. In this description of roof there are no inter-

mediate rafters, the cast-iron sheets being sufficiently large to span the entire distance between the principals, and are secured to them by screws. A very good example of the application of zinc to roofing generally may be seen at the Museum of Building Appliances, in Maddox-street, where the Vieille Montagne Company exhibit their method of uniting zinc with slates. There is one piece of advice we would offer to all those who patronise metallic roofing, and that is not to choose the thinnest description. If gutters or ridges be selected of too small a gauge, they will never keep their proper lines, and nothing looks so bad as a broken and uneven ridge or gutter. If a very thin and light gauge of metal be chosen, additional care must be observed in the fixing, and extra timbers must be introduced in the framing to obviate the liability to sag. It will be more economical in the long run to select metal of a thickness that will never get out of line, and will require the least amount of timber to support it. Owing to the facility with which zinc can be worked after having been once subjected to the kind of annealing process we alluded to at the commencement of our last article, it is exceedingly well adapted for ornamental work, as it bends itself readily to any shape that may be given to it. The ornamental portion of the roof of Charing Cross Hotel is of Vieille Montagne zinc, and it has also been used in the new mansion upon the Marquis of Westminster's estate at Pimlico. For scroll and ornamental work this metal is perhaps better adapted than any other. There are obviously many substances—asphalte, for instance—which, while they admirably fulfil all the duties of their position with respect to solidity, strength, and imperviousness to water, yet would be manifestly out of place when applied to what might in comparison be termed "filagree work." Zinc roofs will answer in almost any situation, except where they are exposed to corrosive action. We should not advise their adoption in the case of an engine shed, or where the fumes of sulphur were likely to attack them. The same argument also holds against the employment of galvanised iron in similar situations. Against the ordinary effects of atmospherical influence, both these descriptions of covering constitute admirable protecting agencies.

ART PRACTICE AND ART SOCIETIES.

IN venturing to follow up somewhat more into detail, without which nothing practical can come, this great subject of art action and practice, it must be borne in mind by the reader that we are speaking at present to a very limited audience, the guild of professional artists—the public knowing nothing whatever about it further than this, that fine art is not to be had except out of a curiosity shop or from an auction room. "It would seem impossible," says the leading journal, "to produce, in these modern days of ours, a building thoroughly fit for its purpose, or expressive of modern wants and feelings." This opinion the general public instinctively endorse; they cannot get what they think they want—they know not why, and if they ask this emphatic "why," it is as much as we can expect from them. It is for the artist himself to both ask and answer. But before this is done it is necessary to bear in mind that the whole of the institutions now so busily devoting themselves to art and its diffusion and so-called improvement, divide themselves into two distinct kinds—viz., those which take upon themselves in some way or other to teach, and those which place before the public or exhibit the results. The antiquarian and archæological societies, the architectural societies, and a number of others, teach and endeavour to propagate art by lectures, book-lending, exhibiting collections of art objects, and other ways; but all having in view the one common object—the diffusion of art knowledge. Nearly all our art societies are of this kind; it is only here and there, almost by accident, that the second kind of influence, and the one thing needful, has any existence at all—the exhibiting of art results. If the Royal Academy could sell all its pictures every year before they were painted, then it may well be doubted whether there would be any annual Academy exhibition of paintings or results. The public would know nothing about it, any more than they do of the proceedings and doings of the Royal Antiquarian Society. Cabinet oil painting is all that is to be seen of genuine *bonâ fide* art work, for neither sculpture nor architecture is ever to be found as the results of personal artistic power. It is only within the last year or two that another society, the "Society of Arts," has practically attempted anything in this direction of art results; and, judging from this year's annual "report" of that society, it would seem to be about to abandon it, for the report says:—"The time has arrived when animation might be given to future competitions by a considerable change of programme. Especial prominence might be given to evidence of ability in processes not commonly practised in this country—such as several of those involved in the manufacture of Venetian glass!" and again in the process of "damascening both after the Milanese and Oriental systems!" Surely if our dull, stupid, and uneducated workmen cannot be interested in, and induced to contribute towards, exhibitions of specimens of work they do understand and work at day by day, what sort of chance can there be of such people, in such a state, manually and mentally producing objects so difficult as these, and of which they know nothing—not even the names! Our ordinary workmen, as things are, do nothing; no evidence of their ability to produce the most ordinary and common things artistically is anywhere visible; how, then, can they be expected to even distinguish between things so out of the way and utterly foreign to them? It may be interesting to note that of all fine art in metal, perhaps the best now produced by our workmen is the engraving or chasing on gun-locks. It is mere matter of routine, and consists of scrolls and dots, and means nothing whatever, but still is sometimes very well and cleverly executed; so that we can but imagine a workingman in some obscure attic being taken from such a work as this, and then ordered to "damascene the gun-lock after the Milanese system, but at the same time not to allow his knowledge of Oriental damascening to interfere with its purity." It seems to me not a little unkind, not to say cruel, to ask of such men work impossible for them to understand or to execute, and then to complain of failure, and abandon the scheme as impracticable, or, what perhaps is worse, give the prize to a foreigner, to whom the work is not altogether strange, and then tell the world that "as compared with the French art workman, the English artificer is somewhat deficient." How can he be otherwise? If, then, any one will be at the trouble of considering this important subject, not only as regards the workman but the artist—the distinction between them consisting mainly in social position—he will but too soon find out that the societies now devoted to art fail in the very first requisite of an art society, if founded on natural and reasonable principles—viz., that it should be the medium through which the art energy and capacity of the time and country are made manifest to the public eye. It is one thing, and a comparatively slight one, to collect and help to the appreciation of old and obsolete forms of art; it is another and infinitely more important one, to help and adequately show forth the existing and living art of the time, and the individual artistic power of each artist. It will be useful to sketch out roughly what such a society should be, and its proper mode of action in accordance with the principle above-named. It can do no harm if it does no good, and will be at least a single protest against the present universal system of art action through subordinates, whereby the public never will or can, while it lasts, see what the artistic power of the time and country is, and what it is worth; and at the same time lose entirely the power and work of what are now called the inferior artistic powers—of those who now destroy each other's work, whatever it may be, in the very act of working together as subordinates. It is one of the most curious of modern problems. The Pugin and Barry controversy, and the Law Courts competition, by pointing to individual art power, and to the giving to the working artist his natural and inalienable right—the credit of his own work—have directed public attention to it in a way that cannot be mistaken.

C. B. A.

THE GROWTH OF LIVERPOOL AND ITS ARCHITECTURAL RESULTS.*

THE growth of Liverpool has been among the marvels of the age. Scarcely less wonderful has been the carelessness of the authorities as to the manner of its growth, and the quality of its accretive matter. The wealthier classes having for many years past resided outside the town, its extension in every direction has been mainly by the erection of dwellings for the poorer classes; and this having been left to men profoundly ignorant of art and with hardly an idea in their heads, art has not only been left out, but a degree of meanness and wretchedness has crept in that would not have been thought possible in a place originally so beautiful—wretchedness which I sometimes fancy may not be quite innocent of some of the suicides that have been so frequent of late. This is still going on, and though the business part of the town is constantly improving, yet Liverpool, as a whole, is daily growing uglier—increase of builded area being proportionate decrease in art, till the leaven of real architecture amongst us will be as nothing compared to the size of the place—"One poor halfpenny worth of bread to all this intolerable deal of sack." But let me give you some idea what the town was once, which I can best do by quoting from an article which I furnished to the BUILDING NEWS some two or three years ago.†

I should not, however, have brought the matter before you but for the impression that these things have been growing worse of late, and that at no former period have such houses been built as are now obtruding themselves on the pleasantest and most respectable neighbourhoods. Assuredly, a more melancholy contrast was never presented in architecture than is at this moment presented in the locality from which I write (Everton) between the character and quality of the buildings they are demolishing and those they are constructing. The former were among the finest brick buildings in the land, the pride and ornament of the place; the latter would be a disgrace to the South Sea Islanders. I am quite sure the New Zealanders at least would build for themselves, with the same means and materials at command, more pleasant-looking, less heart-sickening habitations than those now rearing in the new streets leading off from Church-street, Everton, which have been built on the upper soil or mud, without the ceremony of trenching for the walls, and which appear, from the short distances at which I viewed them, more like a superior class of pigsties than abodes of humanity. A walk along the street just named—Church-street, now called Heyworth-street—which is one scene of desolation from end to end, will convince you that I am not exaggerating. The evil is not confined to Everton. Every beautiful and retired spot of private residence, in whatever direction in the town—north, east, or south—is in course of destruction; and there is not a private house, or private neighbourhood anywhere, however fashionable, if there be any unbuilt land about it, but is in danger of being at any moment made valueless for quiet and genteel abode by the invasion of the Welsh builder and the Cambrian style of architecture. Though it is a relief to me to give vent to my feelings on this subject, yet I have but little hope

* Read by SAMUEL HUGGINS, Esq., before the Liverpool Architectural Society.

† Vide BUILDING NEWS for 1865, page 402.

of any effectual remedy for the evil being forthcoming. A new building act may do something: but nothing less than the extension of legal protection to certain neighbourhoods will be effectual —protection by laws, which would be no more inimical to the proper and rational liberty of the subject than those that are enacted against theft. Without this classification, the hope of anything like equal and uniform architectural beauty in town or suburb is vain. The remedy I mention has not been, and probably will not be for some time, applied, owing to the ignorance of and indifference to architecture that everywhere prevails, and which pervades all classes alike, from the highest to the lowest, and is operating prejudicially on the character of most of our towns and cities. A striking instance of them is exhibiting at Chester, which has lately exchanged some of its characteristic and best Italian buildings for the direst abortions that ever insulted the eye. I allude, in reference to the former, to the Royal Hotel in Eastgate-street, to another hotel in Bridge-street, and to a noble brick mansion approached from St. John's Churchyard, all of which have been destroyed within the last two or three years; the two former to make way for buildings which are actually painful to behold, and the latter in the process of providing a new palace for the present bishop. This is not the worst; the cathedral itself seems in danger of some injury, and has been already roughly handled by the new dean, in the course of carrying out some new preaching arrangements. Dr. Howson, I am quite sure, will in other ways do honour to his new appointment and to the Church; but, from what has already occurred, the friends of art have reason to tremble for the material church in his hands. It is under the impression that it is the duty of these to raise their voice against the profanation that I now venture a word in behalf of the venerable pile, the nave of which, hitherto unbroken by bench or pew, is dotted all over with a myriad of little bedroom chairs of the meanest and slimmest description, furnished by the maker, I am told, at 1s. 9d. apiece. If the choir and south transept called St. Oswald's Church, both of which are very spacious, do not furnish sufficient accommodation, and the nave, all unfitted as it is for Protestant worship, must be used for the purpose, surely it might nevertheless have been treated with a little more of the respect that is due to every genuine example of art. There is talk of restoring the cathedral, which to the ear of an artist, as it will probably involve the entire recasing of the building, simply means destroying; destroying its antiquariau and historic interest, and picturesque beauty.

But we must return to our good old town; not to the part we left, but to that other more favoured portion of it on which the hand of improvement may be traced. The most important operation in the central part of the town has of course been the erection of the new Exchange building. In a former notice of this I blamed it for its departure from the style of its predecessor and the Townhall. But on a review of it the other evening, I was glad to perceive an advantage resulting from the altered style which had escaped me before, namely, an assimilation with the chief buildings around it, which was wanting in the old one, and by which the several hitherto dissevered blocks of commercial buildings are united into one continuous series. The new Exchange links, for instance, Mr. Cockerell's block on the east of it with Messrs. Picton and Sons' on the west; and so of others at the northern extremities, till there will, when it is finished, be a complete district of fine commercial structures, all in perfect accord, and unmistakably commercial in character, that I should think the metropolis could alone parallel in this country. The effect I have pointed out struck me as a very important and happy result of this great change in the heart of the town, though obtained at the expense of leaving in widowed loneliness the Townhall. The decrease of unity or harmony of style in the Exchange area is compensated by increase of architectural truth.

The widening of Church-street is an improvement worthy of the cost, however great that may be, and was becoming inevitable. Let us hope that the new side of the street will emulate the example opposite of the renewed Compton House, which it is only just to say is an excellent specimen of shop or commercial architecture. I would only add on this subject that the church, though rendered more prominent by the alteration, will be no eyesore, if its back and side grounds receive the needful attention. Its venerable appearance will be sufficient apology for its prolonged existence. This reminds me that there is one class of public structures in which Liverpool has made less advance than in any other—I mean the ecclesiastical; for some of the earliest churches and chapels are to this hour the finest. Such are St. Paul's in St. Paul's-square, and St. Nicolas's, as far as the steeple is concerned. It is remarkable that these buildings, both of singular merit and beauty, should have been inoperative on the composition and character of subsequent edifices. St. Nicolas's steeple has an aerial lightness and grace which is highly befitting, and which no spire since erected in Liverpool at all approaches; and shows a more correct appreciation of the true nature and aim of fine-art architecture than any other object of its class in the town.

It is still more remarkable that St. George's Hall should have had so little influence on Liverpool architecture. In contemplating the exquisite beauty and capability of the Greco Roman architecture of that building—which, by the way, begins to exhibit something of the softening hand of time—I have felt surprised at this till I have remembered that it requires highly educated taste to appreciate such architecture. But if the architects of Liverpool had been true to their instincts —if art, and not fashion, had been their mistress —such an example before their eyes, of a style of the perfections of which our ideas have been greatly raised of late years, would have had a very traceable and happy effect on their works. Assuredly, no man who has really felt the beauty of the architecture exemplified in this building could tolerate, much less perpetrate, the coarse, cheap modern applications of the Gothic that we see daily rising up around us—a style beautiful in its enriched and sculpturesque examples, but incapable, at least in the state in which the mediævalists left it, of embodying beauty on other conditions. An unadorned column is, or may be, like beauty's self, when unadorned, adorned the most; but a naked buttress is a monstrosity, without relation to the beautiful in nature, and which no magic of position or combination could raise into the heaven of art. The sculpture and panelling of its best examples are but to disguise its ugliness. Our local art critics are ever discovering some new fault in the building in question. Faults it has, but its chief fault is that, standing where it does, it is not, nor ever can be, in full harmony with the busy neighbourhood and prosaic life about it. Such a building should be accompanied only by palaces, churches, and halls in its own grand style, and participating, more or less, in its own grand repose, and with glimpses between of the green, peaceful world of pure and beautiful nature stretching far around it.

I am more than ever convinced that the architect, to be true to his vocation, must, whatever style he affects, be inspired by the sure beauty of the Greek architecture and sculpture; which is to be his guide to the highest possibilities of his art. To pursue the Gothic style in the spirit of the times alone that produced it, and without reference to the higher standard of excellence presented by the glorious remains of Greece, is to ignore the noblest means of progress that the ages have bequeathed to art; and is as absurd as it would be for the engineer to turn his back on the mechanical powers, and trust to the unaided strength of his arm. It is the lever that is yet destined to move the architectural world. Let me express once more my belief, my deep conviction, that the true path of progress in our art is in the cultivation of an Anglicised and purified form—purified, I mean, by reference to Greek examples—of the style which we inherit from the Romans, through the Italians, and which never ceased to be practised in the art-home of Europe —Italy, whence it spread, along with other elements of civilisation, into the different countries of Europe.

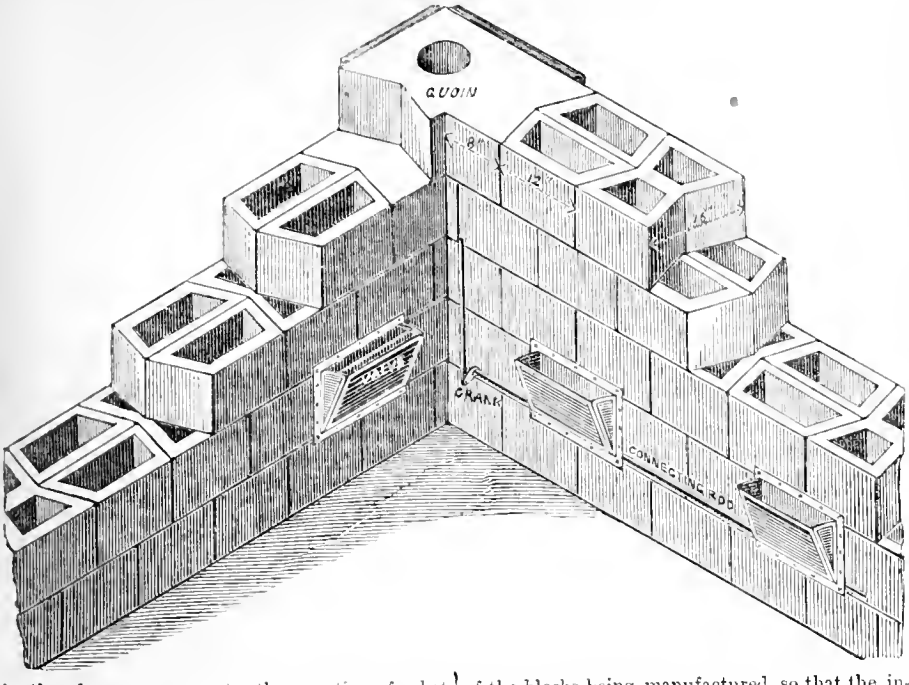
I have leaped from St. Peter's Church and Church-street to St. George's Hall. While there let me give a word or two to its surroundings. I think sculpture should not be strewed about the area while the building itself has need of it. The latter, I fancy, might legitimately receive statues of the Queen and Prince Consort as decorative features completing the design; indeed, such positions as the apex of a pediment or acroteria—positions decorated in ancient examples by gods and heroes, and in modern ones by prophets and apostles, would be very honourable ones for memorial statues. The two pedestals above the east portico might even receive equestrian statues At the demolition of the Railway façade we need, for obvious reasons, express no regret. It is only a pity the scheme of destruction had not included the Wellington Column, than which there is, perhaps, not among the relics of the tenth century, in the darkest corner of Europe, an object more truly barbarous. Whether the intended colossal hotel, with its some half score storeys and its thousand and one bedrooms, will be as innocent of injury to its *vis-a vis* as was its predecessor, remains to be seen. Law, music, the drama, literature, and natural history having now their part in this fine area, it is to be hoped the remaining portion at the north end will yet be given, as seems meet, to painting and sculpture in the proposed new Fine Art Gallery; which is, indeed, necessary to wipe off the reproach to Liverpool of being without an annual exhibition or Academy of Art.

THE WEST DERBY SEWERAGE DISTRICT.

THE West Derby Local Board having already expended £30,000 on sewerage works in laying out a system of mains within the township, have brought these mains to certain points from which either an outlet to the sea might be made, or some system of utilisation might be adopted. Before moving in the matter they very wisely this week convened a meeting for the purpose of meeting Mr. Rawlinson, C.B., C.E., and hearing his opinion as to the best course to be pursued.

Mr. Rawlinson said this sewerage question, as they were aware, was a very important one. He did not know whether they were tormented in this part of the country in discussing rival schemes of the dry-earth system and the water-closet system, and he did not want to enter into them unless he was questioned about them. At the same time he said that the dry-earth system did not stand a shadow of a chance compared with the other system. It was in operation in Wakefield gaol, where it was said to answer very well, and also at some asylums; but what was convenient at works or at a gaol, where everything was under regulation, was not applicable to private houses. He predicted wherever it was put into operation it would fail. Up to this time, in this country, we got rid of sewage by draining into the nearest watercourse if inland; and if the river was of small capacity and with a sluggish current, and it had to pass a population, an abominable nuisance was inflicted upon them. That might be seen all along the length and breadth of the West Riding of Yorkshire and in Lancashire, and nothing more abominable than the rivers and streams in these counties could be conceived. As they were aware, the utilisation of sewage was very much spoken about and beginning to be practised. He had served eight years as a royal commissioner to inquire into the utilisation of sewage, and he had served also three or four years as chairman of the River Pollution Commission, and he supposed should know something about it. West Derby was situated, he could not say under peculiar circumstances, but they were so far peculiar that they were much nearer to the river than to their outlet. There was a ridge of land running along between the river and the main portion of the township which shed the rainfall back inland. It was proposed in some cases to utilise the whole of the sewage upon land, but there were difficulties in this climate, as there were times and seasons when there was more rain than they knew what to do with. There was a difficulty of getting rid of the surface water at such times. It was quite true they might put the sewage on the land and even with some advantage, yet scarcely with the advantage that would pay the cost of pumping, and if they tied themselves up with the pumping scheme they must everlastingly pump. If they tied themselves up with the deodorising scheme or utilising scheme, they must see that in future there was very little chance of their being enabled to extend their operations beneficially; and if it resolved into a disinfecting scheme, then he had no hesitation in telling them that they might make a clean sweep of any idea of profit, and lay themselves out to a growing and annual cost. To take the solids out of the sewage—and he would not say disinfect the sewage, for no means had yet been discovered that would disinfect water turned into sewage, but they might use chemicals that would reduce the chance of fermentation to the minimum—would cost that township, with its present population, from £1,500 to £2,000 a year, and they would still have an intolerable nuisance at the point where it was carried on. With regard to the figures of the chairman, he had every confidence in them, and

RANSOME'S HOLLOW BUILDING BLOCKS.



he therefore now came to the question of what was best to be done. He then spoke in recommendation of the fourth line mentioned by the chairman, and said if they got an outlet to the sea at that point he did not believe they would ever be charged with polluting the river. He thought if they did that they would have solved the difficulties as regarded themselves, and they would be safe for all time to come.

Several members of the board expressed themselves in favour of Mr. Rawlinson's opinions.

It was also decided to call a meeting of the main sewerage committee at an early date, to report to the next board meeting, and, judging from the expression of opinion at the special meeting of the board, they will no doubt recommend that the outlet scheme should be adopted and at once commenced to be carried out.

RANSOME'S HOLLOW BUILDING BLOCKS.

THE above illustration represents a method of constructing outside walls for buildings. These blocks are manufactured by Mr. F. Ransome, the well-known patent stone manufacturer.

The advantages to be derived from this method of building may be thus briefly described:—In the first instance it would introduce a simple and most effective means of ventilation, for the wall, being hollow and partitioned in its thickness, would contain within it two distinct columns of air; it is evident, then, that the sun's rays, falling on the outside of the wall, would rarefy the air in the exterior flues, thereby causing an ascending current, and exhausting the vitiated air through valves placed near the floor line, or any other point which might be considered best to ensure good ventilation. At the same time fresh air would be admitted through the interior flues and near the level of the ceiling by means of valves placed in the exterior of the walls at a certain elevation above the ground line. These valves might be arranged so as to be perfectly under command from the inside of the building, and capable of simultaneous adjustment by an arrangement of rods and levers.

The description of valves shown may not be the most suitable, but they serve to illustrate the principle as well as any other. It may confidently be expected that there would always be sufficient difference between the temperature and specific gravity of the atmosphere within and without the building to maintain efficient ventilation. The area of the air spaces might also be under perfect control, so that violent and injurious currents could be obviated.

Secondly, by this method of construction, great facilities would exist for ensuring dryness and improved decoration. From the fact of the walls being hollow it is quite clear moisture could not be absorbed so as to pass through to the inner surface, and, as the nature of the material admits of the blocks being manufactured, so that the interior walls may present a perfectly smooth surface, it does away with the necessity for plaster; the only finishing necessary would be to rub down the walls with a piece of the same material, and wash them with clean water applied with a common whop stock brush.

And, thirdly, there may be claimed for it considerable strength, together with speedy and economic construction. It is evident the strength of a wall thus constructed can scarcely be exceeded, the quoin stones being set last, and forming at once the key and closure of the building; it would be impossible to remove a block without destroying it. This plan of dovetailing was successfully introduced by the author of the mode of construction we are now describing about ten years since, in the erection of the stone solitary cells of a large penal establishment in the colony of Victoria.

These blocks, from their uniformity and accuracy, could be set with great rapidity; they could be made of any size, suitable to the designs of the architect. Blocks of the size shown in the drawing are equal in cubic contents to fifteen standard bricks, and in all probability they would not take longer in setting, if so long. Presuming, then, that the first cost of production would not be excessive, that plastering and other finishing would be saved, whilst at the same time a simple and effective mode of ventilation would be introduced, this mode of construction, taken as a whole, recommends itself to notice on the score of its own merits, and, as we have before stated, it would appear especially applicable for India and other tropical climates.

This method of construction also offers the advantage of a durable stone building at a comparatively cheap cost, as a saving may be effected in the carriage of the blocks on account of their lightness. When desired the cells can be filled in with cheap concrete, either wholly or in part.

PORT ERIN BREAKWATER.

A CORRESPONDENCE has been published which passed between the Board of Trade, the Governor of the Isle of Man, and Mr Coode, the civil engineer, relative to the alleged failure of the great breakwater now in course of construction at Port Erin, Isle of Man. The principal statement in that correspondence was that the rubble mound at Port Erin had been so destroyed by the great gale of the 22nd of February last, that the cost of the construction would be increased from £58,200 (the original estimate) to £70,200, being an increase of £12,000. The subject is causing anxiety in the Isle of Man, inasmuch as the local legislature recently decided on expending close upon a quarter of a million of money in the construction of similar works at Douglas. It is now held that, if the rubble mound principle has failed, or say partially failed, at Port Erin, there is nothing whatever to prevent a similar catastrophe at Douglas; and, therefore, some other principle for the construction of the proposed works at the latter place will have to be adopted. Another batch of correspondence on this subject is also published. The first letter is from Mr. Quirk, the Receiver-General of the Isle of Man, and chairman of the Manx Harbour Commissioners' Board. This letter, after referring to the previous correspondence, states that the commissioners recently passed the following resolution:—"That before the board can form any opinion or come to any conclusion on the subject discussed in the correspondence, it is advisable that a diver be engaged, at the instance of the board, to examine the state of the rubble mound at Port Erin, and to report as to its state and condition, and the state of the ground in its vicinity." The diver (a Mr. Seldon) carried out the instructions contained in the above resolution, on the 19th ult., the diving operations being conducted personally by seven of the harbour commissioners. The diver's report was looked forward to with great anxiety by those interested in this matter. It is addressed to the Receiver-General, and is as follows:—"I have the honour to inform you that, according to your directions, I went to Port Erin harbour works on the 19th instant, and by means of the diving apparatus examined the breakwater now in course of construction. I dived from a boat moored over the rubble mound. The harbour commissioners were present, who instructed me from time to time as to my movements. I walked over the mound at several parts, and around the mound on the sand. I found the mound entire, with green seaweed grown over it, and the sand around the foot of the mound was clear of rubble." The concluding letter in the correspondence is from Mr. Coode. He expresses his satisfaction at the result of the diver's examination, and then goes on to state that, on the 27th of February last, the day on which the local legislature decided on the Douglas works, he did not know exactly the effect of the gale of the 22nd of February on the mound, but he fully believed that the sections submitted to the court (which showed the rubble mound comparatively uninjured) were "correct." "It was not until the month of April that the sea became sufficiently smooth to allow the taking of such a series of soundings as was necessary to make a complete set of sections; and it was only then discovered that the wave action had extended to the depth of 19ft. below low water in the gale of the 22nd of February last." The diver's report has been regarded by the harbour commissioners as so very satisfactory that Mr Quirk states that they have come to the following conclusion:—"That the current report of the rubble mound having disappeared from its position was an unfounded one, but that rather it was comparatively in a satisfactory state."

THE SOLID LEVER BRIDGE.

THIS bridge, in its essentially original features, is the invention of Messrs. Cottrell, Liscom, and Merrill. These features may be best explained by describing the mode of construction, as we find it in the *American Railway Times*, and which is as follows:—In throwing a span from one abutment to another, the first step of all is to lay down upon each abutment a timber projecting over the edge of the bank a short distance. The length of the portion of the structure projected over the chasm is to that portion upon the bank (which is the balance power) as ten to three. Upon the first layer of timber is placed another, extending further, and firmly trenailed to the first, each successive course projecting further outward over the chasm, and well secured by bolts and trenails, so that when by successive projections the final layer is brought to reach the middle of the span and unite with the corresponding lever from the opposite side, it presents a well-proportioned lever, nearly as solid as if sawn entire of one piece, its projecting weight balanced by that portion of the lever resting on the abutments, and the two united and strengthened by two or three additional courses laid over all. The two levers thus making the sides of the bridge are connected by girders, or floor timbers, on which the flooring is laid—the shore ends bound together to form a cradle for the reception of ballast. Thus completed, a span of 200ft. would reach back 30ft. upon each bank, and a span of 500ft. 50ft. back. Over this structure two wooden arcs are placed, of slight and graceful curve, united and securely

fastened to the main structure by upright iron rods, and abutting in the shore ends of the bridge.

The advantages of this bridge may be stated thus:—1. Economy and facility of construction. It is claimed that an almost unlimited length of span is attainable, and the building of piers, which in deep and rapid rivers are very costly, and which obstruct the navigation, is avoided, and the cost of scaffolding saved. The plan of construction is such that any carpenters and blacksmiths can furnish the materials and do all the work. 2. Strength.—From the peculiarity of the structure, being lightest in the centre, all the material bears its true proportion of strain, and there is no waste, and the distribution of the component parts makes them all act at the greatest mechanical advantage. The sides of the bridge being levers balanced by the shore end, the bridge is relieved of the necessity of sustaining its own weight in the centre, where an ordinary truss-work sags the most; and being very light in the centre there is no unnecessary strain upon the balancing or shore end. 3. The arch adds great compactness and increases the strength of the whole in a peculiar manner. Like any other arch it thrusts laterally against its abutments, but its abutments are the two ends of the bridge into which it is built, and it thus forms with the stringcourses of timber a wooden bow with a wooden string. In order to spread this arch, the chord or upper string timber would have to be dragged apart by longitudinal strain. Thus there can be no deflection of the bridge after it is well set together. It is this combination of the arch on the one hand, with the re-enforced lever on the other, which gives this bridge a strength immeasurably superior to that which the same amount of material would give when arranged in any other form.

In the Iron Bridge, patented by the same inventors, and involving the same principles, the strength attained is practically illimitable. A model of this, 32ft. in length, is exhibited at the office of the Solid Lever Bridge Company, 46, Congress-street, which illustrates this. The advantages of a cheap, easily constructed, and strong wooden bridge are manifest to all—but those connected with railways are best aware of the immense importance of cheap and strong iron bridges. The obstruction of the western rivers by piers is so serious an impediment to navigation that this invention becomes of the utmost importance, and comes just in time to solve the problem of how the railways are to cross the Upper Mississippi and Ohio rivers, without navigation being destroyed. This is a matter of national interest, and is now engaging the attention of Congress. The new invention promises to reconcile the objection, and provide at a moderate cost the means whereby river navigation may be preserved, and railway communication across them be attained.

TURNPIKE ROAD TRAMWAYS.

WE have received from Messrs. George Remington and Son, says *Engineering*, a brief description of their plan for laying down tramways along the turnpike and other direct roads from London to most of the principal towns of England, and a company is proposed to carry out the first division and to lay down tramways from Kilburn, by Edgware, to St. Alban's, and from Holloway, by Barnet, to St. Alban's, Dunstable, Fenny Stratford, Stony Stratford, Towcester, Weedon, following the Old Roman Watling-street, by High-cross, Atherstone, Wilincote, Fazeley, near Tamworth, to Lichfield, and thence by the most direct roads through Rugeley, Weston, Stone, Newcastle-under-Lyme, Sandbach, Middlewitch, Northwitch, Altringham to Manchester, and by Warrington and Prescot to Liverpool, with collateral lines from Lichfield, by Burton-on-Trent, to Derby, Nottingham, and the Midland coalfields, Sheffield, Halifax, and Leeds; from High-cross, by the Roman Fosse way to Leicester, Newark, and Lincoln to York; from Weedon, by Daventry, to Coventry and Birmingham, and thence joining the main line again at Lichfield, and from Stanmore, by Watford and Warwick to Birmingham.

There can be no doubt that if a system of tramways were established, heavy goods and minerals, as well as agricultural produce of all kinds, might be conveyed along common roads with much greater ease than at present, that where great speed is not an object passengers might be conveyed at very low fares, and that the facilities it would afford to the working population of the intermediate towns and districts would ensure very considerable traffic of its own without prejudice to the railways, and that it would be of great public utility. In some cases it might be necessary to construct new roadways in the neighbourhood of towns having narrow streets, and in others to widen present roadways; but in most cases there would be sufficient width between the hedges or fences to lay down tramways in such a manner as not to interfere injuriously with the ordinary road conveyances, as the tramway would be laid level with the roadway. The carriages may be drawn by horses or by traction steam-engines working at moderate speed; and as the system would establish a mode of conveyance something in effect between the present railway and canal, and the first outlay be comparatively small, it would, we think, be very useful to the public, and at the same time offer many inducements for the investment of capital.

SANITARY REGULATIONS FOR WORKSHOPS AND WORK PLACES.

SANITARY ACT, 1866, AND WORKSHOPS' REGULATION ACT, 1867.

THE following are among the more important requirements of the above acts, which are applicable to work places not under the operation of the Factory Acts. It is the duty of the vestry to see that they are observed in every parish.

1. Workrooms and work places must be kept in a cleanly condition.

2. They must be well and effectually ventilated, so as not to endanger the health of the persons employed therein.

[The Medical Officer of Health will regard any workroom as not sufficiently ventilated in which an unpleasant or animal odour is perceptible, or in which the temperature is found materially to exceed that of the external air in the warmer months, or 60 deg. in the colder months of the year.]

3. No overcrowding of workrooms is permitted—that is to say, the number of persons working in any room must not be so great as to endanger their health.

[The Medical Officer of Health will regard any workroom to be overcrowded, in which for the number of persons employed therein, a sufficient ventilation as above described cannot be constantly maintained without exposure of the workpeople to dangerous draughts; also, any room in which a floor space of at least 36 superficial feet cannot be allotted to each person, or in which the cubical space of the room is such as that at least 300 cubical feet of air are not allowed for each person.]

The superficial floor space of a room is found by multiplying its length by its breadth; and the cubical space of a room by multiplying the result of this by its height.

For example:—A room 25ft. long and 15ft. wide = 375ft. of floor space, may (if properly ventilated) be occupied by ten workpeople, provided that it is not less than 8ft. in height = cubical capacity of 3,000ft. If less than this in height, the floor space must be proportionally larger, or the number of occupants reduced.

An infringement of any of the above three regulations will render the master or mistress liable to prosecution under the 19th section of the Sanitary Act, 1866, and the Nuisances Removal Act.

ARTIFICIAL GRANITE.

A METHOD of manufacturing artificial granite, says the *Mechanics' Magazine*, has just been patented by Mr. P. M. Parsons, of Blackheath, well known by his system of converting cast-iron guns into rifled ordnance. The materials of this artificial granite are disintegrated natural granite mixed with clay, together with pounded glass, lava, or iron slags. The disintegrated granite is obtained by submitting fragments of natural granite to a strong heat, about 700 deg. or 800 deg. Cent., in an oven, by which, after a sufficient time, it becomes dissolved into a granite sand, the constituent parts of which, quartz, or felspar, possess great powers of adhesion. One part of this granitic sand is then mixed with about an equal quantity of pounded glass, or the constituents of glass, or lava, or iron slag, to which is added from twenty to thirty parts of refractory clay, or from thirty to fifty parts of ordinary clay. This mixture is thoroughly kneaded together with a sufficient quantity of water to make it of a pasty consistency. It is then moulded to any form required, and submitted to a degree of heat sufficient to vitrify the mass for about thirty-six hours, which converts it into a hard and durable substance resembling granite. The artificial granite thus produced may be moulded into any forms required to render it suitable for various kinds of buildings, fortifications, docks, and other engineering structures, and particularly for all kinds of pavements, for which its great hardness renders it particularly suitable. When very large blocks are required, it is preferable to make them hollow, and, after they have been baked or burnt, they may be filled with concrete, rubble, &c., to make them solid. Any kind of furnace in which the requisite heat can be generated will answer for dissolving the granite and baking or vitrifying the blocks or bricks; but Mr. Parsons finds Hoffman's annular furnaces perform this operation satisfactorily.

A NATIONAL SYSTEM OF IRRIGATION.

A PETITION is being signed for presentation to Parliament, showing "that the present drought throughout the country is, and not without cause, creating considerable anxiety, and that its effect upon the grass, clover, and permanent pasture and green crops is likely to be very serious, and productive of great national loss. That the Government 'agricultural returns' for the year 1867 show that the extent of land under grass, clover, and permanent pasturage and green crops exceeds 32,000,000 of acres; while that under corn crops does not reach 12,000,000. That your petitioners believe a national system of irrigation to be practicable over a great extent, if not the whole, of this large area, and that if established it would very greatly increase the production of the country, steady prices, and relieve the minds of the public from the alarming apprehension which the recurrence of such droughts as the present occasion, while it might be made to subserve the further purpose of preventing the damage which great floods frequently occasion in different parts of the country. That in countries where national systems of irrigation have been adopted the results have been very beneficial, and in consequence other countries are following the example. Your petitioners therefore humbly pray that your honourable house will cause inquiry to be made as to the practicability of establishing a system of national irrigation."

THE LUTHER MONUMENT AT WORMS.

THE inauguration of the monument to Luther by the King of Prussia was attended by an immense concourse of people. The monument consists of a combination of eleven statues, grouped around on a granite base, 40ft. square, open in front, but enclosed at the back and sides by a battlemented balustrade. Pre-eminent in the centre is the statue of Luther, on a syenite pedestal, 16ft. in height, the statue itself being 10½ft. high. The face is turned upwards to heaven, and its expression is calm and bold. On the front of the pedestal appear the closing words of his speech at the Diet of Worms, and under the legend are medallions of John the Constant of Saxony, and his son, who so well befriended the reformer. The lower slab contains scenes from Luther's life, in alto relievo. On four pillars projecting from the corners of Luther's pedestal are statues of Petrus Waldus, Wickliffe, Savonarola, and Huss. In the four corners of the balustrade are figures of Frederick the Wise, Elector of Saxony; Philip the Generous, Landgrave of Hesse; Philip Melancthon; and John Keuchlin. Between each of these are female figures, symbolising the three famous cities of Magdeburg, Augsburg, and Spires. The figure representing Magdeburg is doubtless the best. A female form sits all dishevelled and distracted, the very image of despair, too true a picture of many a woman of Magdeburg when the city was devastated by Tilly's ruffian bands. The representative of Spires stands protesting against Charles the Fifth's reactionary edict, but the attitude is too stiff and constrained. Augsburg is a queenly form holding a palm branch in memory of the peace concluded in that city. The four statues immediately round the centre pedestal are each 7ft. high, the corner statues 8½ft., and the figures of the towns 6ft. The battlements of the enclo-

sure are on the inner side decorated with the escutcheons of twenty-four other German cities. These are Brunswick, Bremen, Constance, Eisenach, Eisleben, Emden, Erfurt, Frankfort, Halle, Hamburg, Heilbronn, Jena, Königsberg, Leipsic, Lindau, Lubeck, Marburg, Memlingen, Nordlingen, Riga, Schmalkalden, Strasburg, Wittenburg, and Worms. It is generally regretted that Rietschel, who designed the work, should not have lived to finish it. He received his commission to make the model in 1856, but had only completed the statues of Luther and Wickliffe when he died. The rest have been modelled from sketches by his three talented assistants, Herren Schilling, Dondorf, and Kietz.

BILLINGSGATE MARKET.

A PROPOSAL is now before the Corporation of the City of London for the removal of this ancient market to some central part of the city, where it can be brought into direct communication with the various railroads by which fish are now regularly conveyed to the metropolis from some of the remotest parts of the kingdom, and in larger quantities than are now brought to the market by the Thames. The Markets Committee of the Common Council have reported that the most eligible situation for a new fish market would be in connection with Farringdon-market, or some spot adjoining, or near the new meat and poultry market at Smithfield. They state that all the railway companies and other parties engaged in the land carriage of fish are in favour of the removal of the market, but the salesmen and those engaged in conveying fish by water are of opinion that it should continue in its present situation. All parties, however, agree in thinking the present area of the market wholly inadequate for the business carried on there. The committee estimate that about three-fifths of the whole quantity of fish consumed in London are now brought by railway, in which proportion, they say, there will in all probability be such a progressive increase as to render it essential that the fish market should be placed in immediate connection with railway accommodation. In 1862, the improvement Committee of the Corporation submitted to the Common Council three plans for remedying the evils then alleged to be occasioned, and since augmented, by the increased traffic in the locality of Billingsgate-market, one of which plans was for widening Lower Thames-street, at the estimated expense of £300,000: another for the formation of a new street from Eastcheap to Lower Thames-street, at the expense of £102,000; and the third, for the construction of a street from the Monument to Lower Thames-street, at the expense of £88,000. It appeared from evidence brought before the committee that in addition to the large increase in the fish trade, a rapid and considerable increase had of late years taken place in the immediate vicinity of Billingsgate-market, which had added very materially to the obstructions in its approaches caused by railway and other vans. The committee are of opinion that the only effectual mode of removing the obstructions would be to widen Lower Thames-street, and form a new street either from the Monument or Eastcheap to Billingsgate; but they consider it very undesirable to attempt to carry such an arrangement into effect, having regard to the great expense it would involve. They are also of opinion that the enlargement of the market would have the effect of increasing rather than diminishing the obstructions, unless the approaches were widened and improved.

THE LIVERPOOL ARCHITECTURAL SOCIETY'S EXCURSION.

WREXHAM and its neighbourhood were this year chosen by the council of the above society for the scene of their excursion. Starting from Liverpool, at about 9:30 a.m., they first directed their course to Wynnstay Park, the well-known residence of Sir W. W. Wynn. The new hall, now in course of erection, has progressed so far as to allow of the main portion of the building being occupied by the family. The building, which is from designs furnished by Mr. Benjamin Ferrey, architect, of London, is in the French château style. Externally it possesses comparatively little of a specially attractive character; but the interior is rich and elaborate in design.

Having spent a short time in the inspection of the principal rooms of the hall, the visitors drove down the beautifully-shaded avenue of the park to Ruabon, whence they returned to Wrexham. Upon their arrival they partook of dinner at the Wynnstay Arms Hotel. The chair was occupied by Mr. F. Horner, the president, and the vice-chair by Mr. William Hay, one of the vice-presidents; and the company included the Mayor of Wrexham, Mr. Walker. The chairman, in his speech after dinner, said that some people affirmed that architecture in the present day was almost an obsolete art, and that the architects now simply reproduced what their forefathers produced, without having power to do anything themselves; but he entirely differed from that opinion. He thought that novelty and originality were very different things. A man might, for the sake of novelty, produce that which had nothing else to recommend it but novelty; but originality in art, properly so called, must have those beauties of form, proportion, and detail which former precedents possessed, and which should be capable of being compared satisfactorily with what has gone before it. He thought the clamour for novelty was very much overdone in the present day, and that a clever adaptation to present wants was in itself a very valuable test of originality in art. At the close of the dinner the party proceeded to visit the parish church of Wrexham, which is an interesting specimen of the sacred buildings of the period of Henry VII., and has a tower 135ft. high. The present edifice was built in 1472, with the exception of the tower, which was not finished until the year 1506. The interior contains several curious monuments—one, by Rysbrac, to the memory of a lady who died in the year 1747. The beatified spirit, represented as a female, is delineated as bursting the bonds of death at the resurrection and rising triumphantly. The interior of the church has recently been restored, but at the same time the original features have been carefully preserved. Several of the party ascended the tower, from the summit of which a most extensive view of the surrounding country is obtained. Shortly before ten o'clock the visitors left the Wrexham station, and returned by rail to Liverpool.

CENTRAL COTTAGE IMPROVEMENT SOCIETY.

THE annual general meeting of this society was held on Wednesday, at the Society of Arts, when Mr. Martin, the secretary, read the report, of which the following is an abstract:—"Although the object originally intended had reference chiefly to the agricultural classes, plans have been found applicable to the wants of the metropolitan artisans who now are conveyed from homes in the country to their labour in town by workmen's trains. An interesting instance of this kind occurs at Penge, where ninety cottages have been erected by the Metropolitan Association for Improving the Dwellings of the Industrious Classes. Every cottage is let, although the rent is as much as 6s. 6d. per week for those with four rooms, and 7s. 6d. those with five. The profit being encouraging the association has acquired another plot of ground adjoining, on which eighty more cottages are to be erected.

"Another interesting example of this application of the society's plans is to be seen at Limberstreet, Windmill-road, Croydon, where Mr. Rowbottom has erected eighteen pairs. These are faced on the other side of the street by one of the old-fashioned rows, and the preference given by the inmates was evinced by the fact that not a single cottage was to let, and there were persons who had put down their names in case of vacancies, while in the row opposite several were ticketed 'To Let.' In this row the rent is 6s. 6d. per week.

"The question of cost is one which presents great difficulties, and is liable to much variation from trade fluctuations in wages as affecting the expense of building and the price of bricks, and to these must be added great differences in the economy of builders and employers. Thus the Alexandra Cottages at Penge, although built in large numbers together, which is in itself an element of cheapness, are stated to have cost £210 the pair, while equally substantial pairs have been put up by Major Munn, of Faversham, Mr. Kibble, of Hadlow, and other gentlemen at £175. Again, Mr. Rowbottom's, at Croydon, cost £265 the pair, while Mr. Clarke's, at Walthamstow, cost but £225, and the pair put up by this society at the Great Exhibition of 1862 by contract was only £216. How far the adoption of concrete may reduce these figures does not yet appear, but the council have now, by the kindness of Mr. Fortescue, an opportunity of making some experiments as to whether it is possible, without decreasing the accommodation afforded to the occupiers, to lower the figures above quoted. Mr. Fortescue has liberally offered the society a suitable site and the means of erecting four cottages, so that the council hope before the end of the summer to have tested the cheapness and applicability of some of the better descriptions of concrete."

THE GUILDHALL IMPROVEMENTS.

THE restoration of the ancient Guildhall of the City of London, which has been progressing during the past five years, is at length approaching completion. In that time the Court of Common Council will have expended upwards of £53,000 upon the undertaking, the finishing stroke to which is being given by the erection of a fine carved oak screen and a dais at the eastern end of the hall, at a cost, included in that sum, of £2,400. The subject of the restoration was first mooted in the Common Council in July, 1862, on a recommendation, which was adopted, of the City Lands Committee, that the then roof of the Guildhall, which was flat and unsightly and had become much dilapidated, should be replaced by an open roof, in accordance with the original architecture of the hall, at an expense of £18,000, and a special committee was appointed for carrying out the work. From time to time the committee have asked for additional grants of money, and these have been voted ungrudgingly by the Common Council until the cost has reached the large sum already mentioned. At the outset a mistake occurred, which, however, was soon rectified, but not before considerable and needless outlay had been incurred. The committee found that the roof contracted for was neither an open one, nor in accordance with the architecture of the period of the erection of the hall itself. Upon this discovery, acting under the advice of Mr. Digby Wyatt and Mr. Edward Roberts, the committee directed that the design for the roof should be so modified as to be strictly in accordance with the first instructions of the Court and the original architecture of the hall, and that the roof should be constructed of oak, instead of fir. They also recommended that the ancient windows, then blocked up, should be opened, and other alterations made, at an estimated expense of £5,900, to which the Common Council assented, and voted the money. Again, in May, 1865, in addition to grants previously made, the Court voted £1,200, at the suggestion of the Improvement Committee, for the erection of a lantern and spire to the roof, and authorised the additional expenditure of £1,800 odd in rebuilding four of the turrets of the hall and two of the pinnacles, and £3,080 in restoring and repairing the internal stonework of the tracery under the windows. The Minstrels' Gallery, constructed of oak at the western end of the building, has cost £1,200; and the construction of the staircases in the turrets to afford access to it £280. The ancient figures of Gog and Magog have also been placed on fresh pedestals at an expense of about £100. The necessary works for lighting and warming the building have cost upwards of £2,430. The repairing of the hall and other incidental works have involved an outlay of £1,358 odd, and the lowering the monuments of Nelson, Wellington, Beckford, Pitt, and Chatham, which had become necessary, about £470. The Fishmongers', the Haberdashers', and the Weavers' Companies have presented each a handsome painted window, and three others have been given by Alderman Wilson, Alderman and Sheriff Stone, and Mr. Cornelius Wilson. On this part of the subject the committee refer with pride to the stained glass window now being placed at the eastern end of the hall as a noble and magnificent expression of gratitude on the part of the Lancashire operatives for the liberality of the citizens of London towards the relief of the distress during the Cotton Famine. The adaptation of the several windows for the reception of the stained glass has been attended with an expense of £855. The contractors from the first have been Messrs. Myers, the well-known builders, and the works have been executed from designs by Mr. Horace Jones, the city architect.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ON Wednesday evening last the annual *conversazione* of the Royal Institute of Architects was held at the rooms at Conduit-street. Mr. Tite, the president for the year, received the visitors. There were between 500 and 600 persons present. The rooms presented an unusually brilliant appearance. Amongst the things exhibited were several early editions of Shakspeare, lent by the president, who also sent several paintings by Stansfield, Roberts, and Cooke. Mr. Leighton sent some curious specimens of Oriental ware, and also some pictures from old masters. There were two pictures, "A Windy Day," and a landscape by George Mason, which attracted attention; and some clever Italian landscapes by John Moore, brother of Albert Moore. Andrew Donaldson, nephew to Professor Donaldson, sent some studies of Venetian subjects; and Mr. Brewer, son of Professor Brewer, contributed several water colour drawings of German architecture. Mr. E. W. Cooke sent some really fine paintings of Venetian architecture. But the picture of the evening was one contributed by Mr. Sandys, the subject representing "Medea." The mythological story of the Golden Fleece is worked in the background. This remarkable picture, which is of itself sufficient to make an ordinary reputation, was all the more examined because it was rejected by the Royal Academy. The Arundel Society sent some drawings, which at some future time will be published. The Architectural Exhibition was, by the courtesy of the committee, thrown open to the visitors, who freely availed themselves of the privilege.

LIMBURG CATHEDRAL.

ONE of our lithographic drawings this week represents Limburg Cathedral. On March 20 last we gave an interior view and small plan of this cathedral, accompanied by an elaborate description from the pen of Mr. J. P. Seddon. Having so recently described it there is no necessity to do so on this occasion.

DETACHED LABOURERS' COTTAGES.

IT is very commonly stated that improved dwellings for the labouring class will not pay. Even Mr. Baily Denton, who may be supposed to be an authority on such matters, intimated at the Society of Arts, in a paper "On the Condition of Agricultural Labourers," that the reason why more dwellings of an improved character are not erected was that they would not yield a fair return. Mr. J. K. Fowler, of the Prebendal Farms, Aylesbury, said it was impossible for an agricultural labourer to pay, as rent, interest at £140, as he had, through his landlord, to build one or two cottages, and he found they cost from £130 to £140 each. This statement was endorsed by Mr. William Hawes, the chairman of the council of the Society of Arts, who said that the society had again and again considered the matter; "They had plans prepared, and every scheme suggested for reducing the cost, but they could not bring it within £130." If anyone has a right to speak with authority on this question, it is the chairman of the Society of Arts, as that society has paid much attention to the best mode of erecting at a cheap cost substantial labourers' dwellings. We venture to say that Mr. Denton and Mr. Hawes are not well informed on the matter, that their statements are misleading and injurious, that good labourers' cottages can be built at a less price than they say. It is however, not very surprising that there should be much lukewarmness on the part of capitalists when men of authority speak positively, and at the same time inaccurately, on this question. In the BUILDING NEWS, No. 696, we gave several instances where cottages had been erected at a much cheaper rate than £130 each.

The Central Cottage Improvement Society in 1866 offered a prize for the best plan of a cottage, consisting of good living room, scullery, pantry, &c., and three bedrooms, which could be erected for £105. The prize was won by Mr. J. T. Smith, of 8, Windsor-terrace, The Grove, Ealing. His design bore the motto, "Can more be done for the money?" We give this week illustrations of front and back elevations, section, ground and chamber plans, as submitted by Mr. Smith; and we also give a minute specification and estimate of the work. Let us hope that Messrs. Denton, Fowler, Hawes, and others will in future be more careful in giving currency to statements which will not admit of verification.

SPECIFICATION (COPY).

Excavate the ground to the depths required for the footings and foundations, also excavate the ground underliving room to the level of top course of footings, and cut away superfluous rubbish to a distance not more than 100 yards. The brickwork to be executed after the manner of "Old English Bond," with good stocks. The arches and bonds (tinted red) are to be of the best red brick, tuck joint pointed. The remaining portion of the brickwork throughout to be neatly pointed with lime and hair mortar. Flush, stop, and whiten the walls (internally) not described to be plastered. The mortar for walling to be of good lime and sharp sand in the proportion of 1 of lime to 2 of sand. No place bricks to be used externally. Pave the scullery, pantry, W.C., and entrance lobby with 2in. York paving, closely set in mortar and bedded in dry rubbish. Provide York stone hearthstones for boarded floors, and 7in. by 3in. sills for front windows. Stone sink 3ft. long on proper bearers, put bell grating and waste, and connect with drain. Lay on service from cistern to sink, and provide and set an 18in. copper, with fire place, &c., complete. Put York stone chimneypieces to living-room and bed-rooms to correspond with drawing. Fit up W.C. with Doulton and Watts's stone closet pan and trap apparatus. Lay on service from cistern and finish complete with pull-up handle &c. Put drains as described on plan. Cover the roofs with 18in. by 9in. or 10in. by 8in. good slate, firmly nailed to 1¼in. by ¾in. battens, each slate fastened with two zinc nails, and to have not less than a 2½in. lap. The ridge and hips to have 1½in. slate roll and slate cheeks. Lath, lay, float, and whiten the whole of the ceilings on the ground floor, the soffit of stairs over entrance doorway, and the ceilings, coves, and partitions on the bed-room floor, and render set the walls of living-room and bed-rooms. The plastering to be done with good lime and hair mortar, in the proportion of 1 of lime to 2½ of sand. The whole to be finished off in a good and workmanlike manner, and to be left white and clean at the completion of the works. Run cement skirting 3in. deep round all the boarded floors. Provide 10s. for hoop iron band to be used as may be directed. Provide and fix over W.C. a good and substantial slate cistern to contain 70 gallons.

CARPENTER AND IRONMONGER.

The timber generally to be of the best yellow deal of the scantlings figured in the drawing. The flooring, shelving, stairs, and W.C. fittings to be of good white deal ¾in. thick, the whole to be wrought and neatly finished. The floors to be closely jointed, the contractor being answerable for shrinkage. The internal floors to be of good yellow deal 1¼in., four panelled, hung with 3in. batts, and fastened with good thumb latch and screws. The living-room door to have a brass handled spring latch. The windows and frames and the three external doors and frames to be of good sound Memel, free from large or loose knots or other defects. The door frames, of 3in. by 3½in., to be rebated and chamfered, the jambs tenanted into stone sills. The front door of 1¾in. frame and ¾in. battens, framed and braced, hung with 4in. batts, and fastened with good 7in. iron rim lock and an 8in. bolt. The scullery and W.C. doors to be ¾in. ledged, ploughed, tongued and beaded, hung with good strap hinges and fastened with good Norfolk latches; put small bolt on W.C. door, and an 8in. bolt on scullery door. The sashes to the front windows to be 1¼in. ovoli, to be double hung with good pulleys, lines, and weights and brass sash fasteners. Put inch wrought window boards and inch beads round all window and door frames, to be fair with plastering when finished. The back windows to have 1¼in. casements (one hung in each window), and solid rebated, beaded, and chamfered frames. Put all necessary iron stays, 2½in. batts, and casement fastenings. Fit up cupboard and put shelves on each side of living-room fireplace (as described on plan). Neatly cut the large boards and put chamfered mould under slate. Put 4in. iron eaves gutter to all eaves and 2½in. drain pipe with cistern head, &c.; the whole to be twice painted. Paint all the wood and ironwork (usually painted), both external and internal, three times with good white lead and oil paint, to be finished in colours as may be directed. Provide and fix 3 fire lump grates P.C. each 7s. 6d. Provide and fix one cottage range P.C. each, £1 5s. Provide and fix ten air bricks. Provide and fix six cast iron regulating ventilators. Provide and fix chimney bars to all fireplaces.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

THE annual general meeting of this society was held at the Whittington Club on the 24th ult., when the council's report, statement of accounts, and other matters were presented and considered.

The election of the council and officers for the next session resulted in the following gentlemen being appointed to serve:—Mr. Benjamin Haughton as president; W. Forsyth Black and Walter Rutt as vice-presidents; as members of council: Messrs. Robt. M. Bancroft, Frederick E. Cooper, William Meakin, George W. Usil, George Waller Willcocks, G. J. Crosbie Dawson, honorary treasurer; and Mr. Frederic H. Roberts as honorary secretary (being his seventh year of office).

This society was originally established in 1859 for the discussion of engineering and scientific subjects, principally among the pupils and assistants of both civil and mechanical engineers. Considerable progress has been made since this time both in the number of its members and its general efficiency. The list of honorary members included several men of considerable eminence in the profession.

It is the intention of the members of the society to institute an annual dinner, which is shortly to take place for the first time. The honorary secretary is Mr. F. H. Roberts, 10, Adam-street, Adelphi, W.C.

GLASGOW INSTITUTE OF ARCHITECTS.

AN application has been made to the Board of Trade for a license for the formation of a new society, under the name of the Glasgow Institute of Architects, to be registered with limited liability, without adding the word "limited" to its name.

The objects for which the association is proposed to be established are—

1. The advancement of the art and science of architecture.

2. The consideration and discussion of all subjects and questions connected directly or indirectly with the profession of architects, and the concentrated expression of opinion upon the same.

3. The elevation of the attainments, the promotion of the efficiency, and the protection of the interests of the architects of Glasgow.

4. The acquisition of profit by the members of the association is not one of its objects.

5. The establishment of a uniform rate of charge by the members for professional business, in cases where no special agreement as to remuneration is made by the parties.

6. The doing all such other things as are incidental or conducive to the attainment of the above objects.

THE CONSTRUCTION AND FITTING-UP OF METROPOLITAN WORKHOUSES.

THE Poor Law Board have just issued a circular letter informing the guardians of the poor in London that they have prepared instructions for the guidance of architects in the construction of workhouses and workhouse infirmaries. These instructions are intended "as a general guide to the architect employed by the guardians, and are not designed unduly to fetter his discretion in the preparation of plans for the consideration of the guardians, or to apply to every detail connected with the construction of the workhouses," but the Poor Law Board say that "they will generally be guided by these instructions when considering plans which may be submitted them for their approval." With regard to the fittings the circular says:—"It appears to the board to be desirable that there should be a nearer approach to uniformity in the mode in which workhouses are furnished, and they are of opinion that whilst, for the ordinary wards, only a few conveniences—and those of a simple character—are required, the sick wards should be more carefully furnished, and all the necessary medical appliances supplied. It is the duty of the medical officer, under the regulations of the board, to suggest the number of articles that may be required from time to time, and they do not doubt the guardians will duly consider such suggestions, or that they will be made by the medical officer with all reasonable discretion, and with due regard to economy."

SOCIETY FOR IMPROVING THE DWELLINGS OF THE LABOURING CLASSES.

ON Friday last this society held its twenty-fourth annual meeting at Willis's Rooms, with Lord Shaftesbury as chairman. The The society is doing a vast amount of decided good, without making half the noise which Mr. Torrens and his party are making in their attempts to carry a questionable measure. This society has a house in Streatham for 54 families; Moods-buildings, in Grays Inn-road, for 20 families, and 128 single women; public washhouses, with an annual number of washings amounting to 15,899; another house in George-street, St. Giles, for 104 single men; another in Hatton-garden for 54 single men; another for 82 single men in Charles-street, Drury-lane, beside renovated dwellings in Clark's-buildings, dwellings for families in Wild-court, Drury-lane, and Tyndall's-buildings, Gray's Inn-road. The whole of these houses, with the exception of those for single men, have been well tenanted, and have yielded a fair balance. We have always maintained that there are wealth and will enough in London to erect a sufficient number of houses for the labouring classes. What is wanted are prudence and honesty in the administration of funds. Improved houses for the working classes might be able to pay better than the thousand and one joint stock companies which have floated in the City during the last twenty-five years.

LIGHTING AND REFLECTORS.

A LARGE ball-room, designed or rather supervised by the late Sir Charles Barry, has three chandeliers. The intention of the end chandeliers is for one to light also a long lateral suite of rooms running at right angles, and for the other to light a lateral corridor and a room which is a prolongation of the ball-room. So far the two chandeliers do yeoman service, and the mansion, when lighted up for entertainments, has a fine effect, but not the full effect. It so happens that the ball-room has likewise three windows in one of its sides, and the windows face respectively the three chandeliers, and the two doors and the chimney piece opposite. There are magnificent glasses over the chimneypiece and in the two bays, and the cost of glass was of no consideration to the late owner. When lighted up the only glass reflecting the light is that over the chimney-piece, reflecting the central chandelier. But the reflection even of this is not repeated. Had the room been designed with two windows and three bays on that side, instead of three windows and two bays, the arrangement would have been unobjectionable in the day time, and at night the illuminations of the three chandeliers would have been repeated, adding greatly to the brilliancy, as also improving the room whenever used without full lights in the chandeliers.

COMPETITIONS.

A SHORT time since a limited competition for designs for a memorial church to be erected in Lichfield was invited. Nine competitors entered the field. The design submitted by Mr. James Fowler has been selected by the committee.

In a limited competition for designs for the new Catholic Church of St. Kevin, Harrington-street, Dublin, the designs by Messrs. Pugin and Ashlin have been pronounced the best.

Designs having been invited for a new penitentiary building to be erected near Belfast, the one submitted by Messrs. Sherry and Hughes has been adjudged the first place, and the design by Mr. T. Hevey, of Dublin, the second.

ARCHÆOLOGY.

THE remains of an ancient Syracusan colony have just been discovered at Cassaro, in Sicily. The surrounding wall was 2,000 metres in circumference and three in thickness. The researches made show that the town was divided into several quarters. In one of them the remains of a fine temple have been found.

The most ancient stone buildings as yet identified are those in the village discovered in the island of Scutorin, in the Greek Archipelago, during the great excavations of Hozzolana for hydraulic cement for the works of the Smyrna and Aidin Railway and the Suez Canal. These remains were disclosed just at the time the French Scientific Commissioners were investigating the effects of the late volcanic commotion. They found that the village consisted of a number of houses built of blocks of stone with the interstices filled in with vegetable substances. As we understand, this stone is lava, but it must belong to a period before the breaking of the great cone, and that is prehistoric. The roofs were found supported with wild olive wood, which cannot grow on the present islands. The village had been buried for thousands of years, like Herculaneum and Pompeii, and preserved to us with its relics. The utensils belong to what is called the stone age, but the knives of obsidian were of exquisite finish. In the houses were found beads of hammered gold, and a better kind of pottery, supposed to have been obtained from the continent.

An archæological discovery of some interest has been made at Namur, in Belgium. A portion of the flooring of the stables of the Military School gave way, discovering a chasm about 10ft. deep. Some of the pupils descending found subterranean passages branching off in various directions. These are proved to be the vaults of the former abbey of St. Jacques of Candenberg. In a remote corner was found a mausoleum bearing the date of 1481, and a Latin inscription showing that it had been raised to the memory of Archduke Francis, son of the Emperor Maximilian and Marie of Burgundy. At the foot of the mausoleum, which was of white marble, was the leaden coffin containing the body.

ARCHITECTURAL SOCIETIES.

THE second general meeting of the Architectural and Archæological Society of Durham and Northumberland has been held in the neighbourhood of Dunstanborough and Bamburgh. Favoured with a continuance of bright sunny weather the early morning ride to Alnwick on Thursday week was not the least pleasing part of the undertaking. Driving through Rock and Rennington the party alighted at the village of Embleton, and proceeded to view the ruins of Dunstanborough Castle. The reasons for supposing the old fortress to have originally been a British stronghold were discussed, as also were the evidences of its subsequent usurpation by the Romans; after which the company re-entered their conveyances, were quickly transferred to North Sunderland, and spent the next half hour in the church dedicated to St. Paul. Onward they proceeded to Bamburgh Castle, standing on its triangular rock of basalt high above the ocean, and once more related the many legends connected with its name. After visiting the church of St. Aidan, the party eventually returned to Belford for the night. Early next morning they resumed their journey in the direction of Old Bewick, staying to inspect the square structure of Chillingham Castle; the old chapel, the British camp, and the rocks marked with concentric circles were each visited in turn, and had their history and peculiarities explained by the Rev. W. Greenwell, of Durham, and Mr. Ralph Carr, of Hedgeley. This terminated the excursion, and the party returned to Newcastle.

BIRMINGHAM ARCHITECTURAL SOCIETY.—The annual meeting of this society was held on Thursday, June 25, the president, Mr. John J. Bateman, in the chair. The report of the council was read, from which it appears that during the past session six papers had been read upon various subjects of interest, and that the present number of professional members is thirty-seven. Votes of thanks were awarded to the retiring officers for their services, and the following gentlemen were elected officers for the ensuing year:—President, Mr. A. B. Phipson; vice-president, Mr. Y. Thomason; treasurer, Mr. J. J. Bateman; honorary secretary, Mr. B. Corser.

PARLIAMENTARY NOTES.

ON Tuesday night, on the motion of Mr. Hankey, the House of Commons ordered a return of the public statues or public monuments in London belonging to the nation, exclusive of those in palaces other than St. Stephen's Hall or in other parts of the Palace of Westminster, or cathedrals, and now under charge of the Chief Commissioner of Works; specifying the dates of erection and names of artists, if known, and from what funds purchased or erected (in continuation of Parliamentary paper No. 366, of session 1862).

Mr. Goldsmid moved, and Mr. Gregory

seconded, that a committee be appointed to inquire into the appointment of Mr. Street as architect of the new Law Courts. Mr. Gladstone thought that under the circumstances, it would hardly seem possible that the Government could arrive at a decision to which there would not be a plausible, and perhaps something more than a plausible, objection. For his part, he expressed his regret that his party failed in rendering the aid which they desired to the Government in this matter. The Government had come to a decision which it would be wrong for the House to interfere with. The appointment of a committee would be a rude instrument of interference with a delicate process. It would be recommending an operation extremely laborious, and with less hope of any satisfactory result than had been already arrived at. He could not concur in any such opposition to the decision arrived at by the Government—a decision arrived at after much care and deliberation. What they had to consider were the design and the cost of the structure. The design had been approved of by the judges, and the cost, which was first stated to be £750,000, was declared to be inadequate, and three times that amount would now be required. He thought the whole question should be left in the hands of the Government. Sir Roundell Palmer was convinced that the Government had not any evidence before them that could lead them to the conclusion that Mr. Barry's plans as to the internal arrangements were the best that had been submitted; and, on the whole, and under all circumstances, the Government, in his opinion, had made the best selection in their decision that could be. Mr. Beresford Hope was of opinion that no advantage could arise in a great and important object like the present—an object that related not only to internal arrangements, but to that which was also most important, and which should not be lost sight of—in point of classic taste and architectural beauty, from the appointment of a committee. He hoped the Government would be firm, and decline to accede to the appointment of a select committee. Mr. Tite suggested that as the site proposed for the new Law Courts was not sufficient, the Courts of Chancery should be erected there, and that the other courts should be built on the land reclaimed from the Thames, each communicating with the other across the Strand. If this were agreed upon he would give the erection of one set of buildings to Mr. Barry and the erection of the other to Mr. Street. This scheme, he believed, would be agreeable to the rival architects, and he thought there was a pretty general feeling in its favour. Mr. Montagu Chambers hoped the Government would postpone the matter in order to erect a grand and useful building, and the proper site for it was in front of the River Thames. Lord J. Manners said the proposal for a select committee would lead to great and unnecessary delay. Some honourable gentlemen were of opinion that the Government ought not to appoint two architects; but the Government notwithstanding, in their judgment, and looking at the plans, and acting upon the opinions furnished to them, deemed it advisable to appoint two architects, namely, Mr. Street for the erection of the new Courts of Law, and Mr. Barry for that of the new National Gallery. As to the opinion of Messrs. Shaw and Pownall, he did not see why the Government should be guided more by that than by the opinion of the joint committee of barristers and solicitors. The Government had taken all the opinions of the judges into consideration, and acted with the utmost impartiality; but if they were to take the mere *ipse dixit* of the hon. member for Calne, then they would be bound to abide by the award of Messrs. Shaw and Pownall, and that was a position which the Government thought untenable. The judges, looking at the plans of the architects, gave their opinion in favour of the elevation of Mr. Street; whereas, with regard to the internal arrangements of the Courts, the plan of Mr. Barry seemed most to meet their approval, but they left the Government to decide between them. The Government, however, had been furnished with the opinions of gentlemen, who, from their business in the offices of the various Courts, and their experience, did not approve of the internal arrangements, as set forth in the plan and report of Mr. Barry; and he (Lord John Manners) would refer in particular to the opinion of the gentlemen connected with the Court of Probate and Matrimonial Causes, as disapproving of that plan. The Government, in that case, thought the best course they could pursue was to appoint Mr. Street and Mr. Barry in the manner he had indicated. The latter gentlemen had expressed their dissent from Mr. Barry's report in a protest, numerously signed; and the Government were bound to consider the opinions of those and other experienced officers. The noble lord read the opinions and protest of the officers of the Court of Probate and Matrimonial Causes. He believed, looking at all the considerations and requirements, that the public and the profession would be of opinion that the Government, in appointing the two architects, under the circumstances, had acted prudently. The House, after a few words from Mr. Goldsmid, divided, when Mr. Goldsmid's motion was rejected by a majority of 15.

On Thursday week, in the House of Commons, on the motion for going into committee of supply, Lord Elcho rose to move that the statue erected to the memory of the late Sir R. Peel be removed from its present site in New Palace-yard. That statue was first placed outside of the yard wrapped up in a dirty sheet. Then it suddenly disappeared, but after a lapse of about a fortnight it reappeared where it now stands—not in all its beauty, but in all its deformity. The best thing that could be done with it would be to put it into the smelting pot, and erect another that would be worthy of his fame. The noble lord concluded by moving that the statue should be removed from its present site. Mr. Beresford Hope, in supporting the motion, would not say more than that the friends of Baron Marochetti ought to take steps to remove the statue of that distinguished statesman the late Sir Robert Peel. As the statue presented itself to the view, it appeared to be more like the statue of a commissioner of police than of the great statesman whose memory was held in high esteem by his country. The country should have a strong Minister of Art, supported by a council; and if that were so, the Metropolitan Board would become subordinate, and the Peel statue and the Leicester-square scandal would no longer be cause of dissatisfaction to the public. Mr. Cardwell, in explaining the manner in which the Peel statue was originated, enumerated the names of the committee of noblemen and members of Parliament who constituted the committee, of whom only one member, the right hon. gentleman, Colonel Wilson Patten, now survived. He (Mr. Cardwell) was secretary to the committee, and they selected the late Baron Marochetti to execute the statue. Mr. Layard said he had had the honour of acquaintance with the late Baron Marochetti, who was a most amiable man and a great artist, and it was therefore with great pain that he must in sincerity condemn the present statue. The statue was first placed on another site, and was shifted from that to its present situation. It was now on an inclined ground, and a greater mistake could not be in the placing of a statue than to set it up on a sloping ground. In his opinion, before a statue was erected, a model of it should be set up on the intended site for inspection, and if approved of, then let the statue be erected on that site. Lord John Manners trusted that the statue would be permitted to remain, as the public faith had been pledged to the subscribers that the statue should be placed in Palace-yard. Several other members joined in the discussion, when the House divided, and Lord Elcho's motion was carried by a majority of 111.

Mr. Bentinck asked her Majesty's Government whether they would obtain, by purchase or otherwise, the materials of the tower of St. Mary Somerset Church, Upper Thames-street, now advertised for sale by tender, with a view to the re-erection of the tower in some fitting locality. Lord J. Manners said that, after the decision just arrived at by the House, the Government would be very careful in accepting works of art even as a gift, and he could not recommend the House to expend money upon the object named by his hon. friend.

WATER SUPPLY AND SANITARY MATTERS.

ON Friday last the River Pollution Commissioners were at Rochdale, and, along with the Mayor and the members of the council, visited Messrs. Kelsall and Kemp's large manufactory, where they took samples of the "wash;" next Mr. Whipp's oil manufactory; then the River Roach, as it entered the town; and from there to Messrs. Bright's extensive carpet manufactory, and other manufactories round the town.

At the meeting of the Metropolitan Board of Works on Friday last the following very satisfactory letter was read:—"60, Threadneedle-street, June 26, 1868.—Sir,—Herewith I have the honour to sent you duplicate specimens of the samples of our crops, which we are exhibiting at the show of the Essex Agricultural Society this day. Some of the samples are quite unprecedented. The sample of wheat is grown on a piece of land which bore the same crop last season. The oats, which are perhaps the most extraordinary ever seen, have been produced by the unexhausted manure left on the land by the application of 4,000 tons of sewage per acre last year to a piece of land from which we got last season 71 tons of grass per acre. This is a conclusive refutation of those enemies who pretend that sewage farming exhausts the land. I trust that these samples will be interesting to the board, and remain, sir, yours very faithfully, W. HOPE. Sir John Thwaites, &c." Some specimens of wheat, barley, oats, potatoes, and strawberries accompanied this letter, and were of extraordinary size and quality.

Building Intelligence.

CHURCHES AND CHAPELS.

The town church of St. Helier's, Jersey, has been restored under the direction of Mr. John Elliott, architect, at a cost of £4,501. The edifice has been re-pewed in oak, the stonework restored, a new transept built, and the nave extended, and various other works done, painted windows inserted, &c. The contractor was Mr. Westway; and the clerk of the works Mr. Frank Le Sueur.

On St. John Baptist's day the church dedicated to him at Enderby was consecrated after enlargement. The nave has been lengthened, the chancel enlarged, and a new organ chamber and vestry added; the cost of the restoration is about £5,000. Mr. Birchall, of Leeds, is the architect.

The foundation stone of a new Wesleyan Chapel was laid last week at Dunnington, Yorks. The building will be of red stock brick, plastered inside. Mr. E. Taylor, of York, is the architect; the cost of the building, which is of a plain character, will be £600.

On Thursday week the foundation stone of the new church of St. Ann, Cato-street, Birmingham, was laid. The building, which will seat 820 persons, at a cost of £2,170, has been designed by Mr. J. A. Chatwin, Mr. J. Briley being the builder. The plan consists of nave, with three galleries and a small chancel.

St. Peter's Church, Walsall, was reopened on Sunday last after restoration. The church, which is externally of a very meagre appearance, is Early English, and built of brick. It has been entirely re-pewed, re-paved, and decorated. Mr. G. B. Nichols, of West Bromwich, was the architect, and Messrs. Taylor, of Walsall, the contractors. The decorations were executed under the direction of the architect, by Mr. Gee, of Stafford.

On St. John Baptist's day the parish church of Wentworth, Cambridgeshire, was reopened, after extensive restoration, at a cost of over £1,000, under the direction of Mr. Preedy. An open timber roof has been substituted for the plaster ceiling of the nave, the tower wholly restored, and a new porch erected.

BUILDINGS.

The new Foreign Office was opened for the transaction of public business on Wednesday last.

On Saturday last Mr. M'Cullagh Torrens, M.P., laid the foundation stone of the new Assembly Rooms, Defoe-road, Stoke Newington. The building will comprise on the ground floor an assembly-room capable of holding from 400 to 500 persons, and another hall partially below ground, but well lighted and of but slightly smaller dimensions than the upper. The building will not occupy the whole of the frontage, leaving space for further additions, whenever needed. The style is Italian, with a front of white brickwork relieved by red brick.

On Saturday last public baths, which have been built by the corporation of Rochdale, at an expense of about £8,000, were formally opened, with great ceremony, by the Mayor. The building is situated in Smith-street, and is two storeys in height; it is built of brick, with stone dressings. The swimming bath is 44ft. long by 23ft. wide. The private baths are fitted up with hot and cold water apparatus. The first-class swimming bath, on the right, is 66ft. long by 39ft. wide, and is capable of holding 44,000 gallons of water.

The façade of the Hôtel Carnavalet, formerly the residence of Madame de Sevigné, but now destined to contain the Museum of the city of Paris, has been completely restored, and the scaffoldings removed. The sculptures by Jean Goujon have been treated with care, and present excellent examples of his style; they consist of a group of two children, in a medallion, supporting the arms of the original proprietors of the mansion, three trophies of arms, a winged figure with the feet on a mask and a cornucopia in one hand, and two lions. The repairs of the interior are also proceeding rapidly.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—G. T. S.—W. W.—G.T. R.—W. P.—J. H. B.—I. C., with photo. of villas.—I. H.—E. W. P.—I. C.—F. S. S.—S. F.—I. M. B.—I. T.—T. C. E.—I. and Son.—H. S.—E. W. G.—E. D.

"THE USE OF ASPHALTE IN CONSTRUCTION."

To the Editor of the BUILDING NEWS.

SIR,—I have read in your paper of the 12th ult. an article on the "Use of Asphalte in Construction," in which you recommend it for covering roofs, and mention that the authorities of the British Museum made some experiments to test whether or not it was combustible. I have also read, in your paper of the 19th ult., Professor Donaldson's letter. I trust you will accommodate this company with space for the following statement, in reply to the latter part of the Professor's letter, for the purpose of satisfying your readers of the incombustibility of *Pyrimont* asphalte. The late Mr. Braidwood, of the Fire Brigade, had charge of the British Museum building, and doubted, from motives of security, the propriety of using asphalte for roofing the snow gutters and other portions of the new reading-room roofs, then under construction by Messrs. G. Baker and Son, of Lambeth; Mr. Henry Fielder, the managing partner of the firm, arranged for an experiment which was made on November 6, 1855. There were present:—Sir Henry Ellis, Sydney Smirke, A. Panizzi, G. W. Baker, G. Baker, and Henry Fielder, Esqs., with Mr. Superintendent Braidwood, and two clerks of works.

A mass of fire, 3ft. diameter, formed by the combustion of thirty-four faggots of wood, with coal and coke, was maintained for the space of one hour upon a portion of the asphalte that had been laid down to form the roofing portion of the snow gutters. At the expiration of the above period the soffit of the arch beneath became too hot for the hand to be held upon it. It was observed that the fire did not spread farther than the space above mentioned, and beyond fusing that part of the asphalte no damage was done to the adjoining portions of it, thereby satisfactorily proving to the minds of all present its perfect incombustibility. The details of this experiment were taken by me, with Mr. Fielder's permission, from his notes made at the time.

I beg, further, to add, that upon the occasion of the fire that about thirteen years since destroyed the greater part of Messrs. G. Baker and Son's buildings, a roof formed of this particular asphalte over their engine-house did not take fire, notwithstanding the intense heat, and it was so little injured that only a few corrugations, caused by the burning fragments falling upon the material, were noticed. It showed no tendency to ignite.—I am, &c.,

J. FARRELL, Sec.

Seyssel Asphalte Company,
5, Parliament-street, S.W., July 1.

MR. MOORE'S DECORATIONS.

SIR,—I am sorry to be obliged to trouble you with any further correspondence on this subject, as it seems to have degenerated into a personal squabble between Mr. Moore and myself, which I have no wish to prolong. Nor should I ever have exhumed these drawings from the oblivion they had sunk into had I not been asked by gentlemen connected with the exhibition to send them, as they have formed the subject of several criticisms in your journal, indirectly blaming me for not urging more strongly their adoption.

I owe Mr. Moore an apology perhaps for not writing on the drawings a memorandum to the effect that the colour of the seating behind the fronts of the balcony, upper circle, and gallery, had been altered from the "delicate flesh tint" Mr. Moore originally suggested, but for nothing else that I am aware of—this "delicate flesh tint," by-the-bye, coupled with the unmitigated ugliness of the detail referred to, being the very points which made the scheme ridiculous in the eyes of those for whom the theatre was built.

I can only re-assert that in no other particular has a single line, colour, or shade been altered by me since the drawings came into my possession. What Mr. Hart states he did at my instance is, I dare say, quite correct, though most certainly I have not the smallest recollection of it, nor does it in any way alter my assertion. Mr. Moore had ample thanks from me when he first offered to give his suggestions; the understanding was perfectly explicit that I could offer him no remuneration. I have had none myself for all the time I spent on the matter. I bore all the expenses for the time Mr. Hart was engaged in the preparation of the drawings, and was not aware that Mr. Moore required any formal thanks. It was simply for the sake of his picture that I asked him at all, he having prepared his sketch without consultation with me as to what I wanted, and before the decoration was thought about. Those present at the time the matter was discussed and abandoned will bear me out when I state that had Mr. Moore acted with good temper, or even common politeness, his scheme or a modification of it might have been accepted. As it was I had the greatest difficulty in preventing, not only his decoration, but also the picture, from being cast aside altogether.

CHARLES J. PHIPPS, F.S.A.

26, Mecklenburgh-square, June 30.

[We can insert no more letters on this subject.]

ART BY THE MULTIPLICATION TABLE.

SIR,—I read with pleasure, in your last number, that a design for a lamp pillar, of somewhat vigorous and artistic character, has been designed to ornament the Thames embankment, and I trust sincerely that the editorial brush has not been unduly dipped in *couleur de rose* prior to its description. It is delightful to think that the figures of the little-boy torch-bearers "compose with the shaft in a manner so successful as to present in *every view* an effective system of lines and *quantities*." The only misgiving one can have on the subject (for without having seen the models it is impossible to question the admiration thus expressed) is with regard to these *quantities*, and the consequent presentation in *too many points of view* of cherubs, even though "less fleshy than those of Rubens and Murillo, and more graceful than those of Correggio." Thus, though the lions' heads on the pedestals may be, "when examined, admirably designed," unless I am greatly mistaken the public is beginning to weary of them before half are fixed, and to dread the notion that it will have to endure them by the mile.

So, therefore, however "happy the idea as applied to a pillar for supporting a light" may be that of "two boys clinging round a central shaft, the higher holding a torch with which he is about to light the lamp above, while the lower supports and lifts him on his shoulders," it is one to the repetition of which there must be a limit. Are we, then, to have as many lamps as lions' heads, and double the number of naked little urchins, ever striving, but never succeeding in getting to the top of a pole? If so, I cannot but fear that the result of many a moonlight walk by the silver Thames will be nightmare visions of a "thousand thousand slimy things," and that we shall find that it is quite possible to have too much even of a good thing, such as I am quite willing to believe from your description the design in question may prove to be.—I am, &c.,

Louth. J. P. S.

LINCOLN CHURCH COMPETITION.

SIR,—I beg to send you the enclosed letter from the incumbent of St. Swithin's, Lincoln, which will explain the reason why my design for this church was accepted.—I am, &c.,

JAMES FOWLER.

[COPY.]

St. Margaret's Lodge, Lincoln, June 26.

DEAR SIR,—In answer to your inquiry I can only give you what I *believe* to be the reasons why the majority of the committee preferred your design to that of Messrs. Giles and Robinson. In your design the nave and aisles were 108ft. long by 61ft. broad; in that of Messrs. G. and R. the nave and aisles were (if I remember right) 91ft. long by 72ft. broad. The greater breadth of the latter design was produced by a double aisle on the north. Many of the committee felt a strong objection to this feature and the second row of pillars which it involved. Had it not been for this, I believe Messrs. Giles and Robinson's plan would have been selected. After the selection had been made, the architect* who was professionally employed to report upon the plans, wrote, under date of April 8, as follows:—"I heartily congratulate you on the happy result and settlement of the selection of an architect, for although No. 10 is in no wise to be compared to No. 11 as a work of *art*, still it is so far beyond all the rest in the competition that you acted very wisely in accepting your committee's resolve." (No. 10 was your plan; No. 11, Messrs. Giles and Robinson's.) You are at liberty to give any publicity to this letter you please.—I am, dear sir, yours faithfully,

G. H. PEATT.

J. Fowler, Esq.

RYDE CHURCH COMPETITION.

SIR,—These competitions are so singularly muddled, and at the same time their mismanagement is so fatal a thing to the profession, that I must ask you to allow me to express an opinion partly formed from reading Mr. Peachey's letter in last week's BUILDING NEWS. In the first place it appears that Mr. Scott was called in by the committee, prepared plans, obtained a tender, altered his design, and, in short, performed such work that he could legally claim £700 for it. The committee afterwards publicly advertise for designs, and it is generally known that fifty-seven sets are sent in for their approval. Now it is an established rule amongst respectable practitioners that if a properly qualified architect has been called in upon a job no other architect can take it up unless the first has been discharged for some sufficient reason and paid his claims. Amongst the fifty-seven sets of designs sent in there were several from Ryde and its immediate neighbourhood. The fact that Mr. Scott had been employed must, therefore, have been known to them; and I think that it was the duty of any architect who knew of the circumstance to make it generally known through the medium of some one of the professional newspapers, and I cannot, therefore, think that they are free from blame in the matter. I do not say it is, but it looks much like the conduct of the jackals, who follow the lion that they may devour the prey he has relinquished.

Mr. Scott's time must be very much occupied, but if in his exalted position he can hear the murmurs and whispers of what is going on in the lower world of architecture, surely he might have given a word of warning to the profession as to the forthcoming bill for £700, which appears to have had such a bomb-like effect upon the committee that when it came amongst them

* Mr. R. J. Withers.

their only thought was as to how they must shell out! The moral of all this appears to be that if we only did our duty by one another committees would ask in vain to have designs showered upon them gratis, and would at last begin to see that an architect's time is of some value, and that he spends something beyond the price of the paper, paint, and strainers in their preparation.

Not very far from Ryde, where there has been another competition, I heard the other day that the committee had already chosen their architect, but one of the members proposed to advertise for designs, "as he did when he built his house in the City:" he "chose an architect, then advertised for designs, and got quite a respectable number, then having consulted with his man they chose what they considered the best bits, and returned the several sets to their authors with many thanks." I believe this story to be true, but if not it is well found.—I am, &c.,

F. ROGERS.

P.S.—I ought to have said at the commencement of my letter that I am not a competitor for any work at the Isle of Wight.

9, Buckingham-street, Adelphi, July 1.

SIR,—I am sorry to have again to trouble you on this matter. Your correspondent states that "the committee having subsequently disagreed with the architect whom they chose by competition, &c." If this is so, it is without my knowledge or consent; the disagreement is "all on one side."—I am, &c.,

WM. PEACHEY.

Northgate, Darlington, June 30.

Intercommunication.

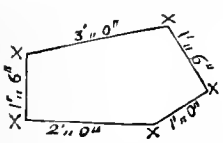
QUESTIONS.

[900.]—BOLTED GIRDER.—Setting aside prejudice and preconceived notions and ideas, which is really the stronger—one piece of timber, 12in. by 9in., or the same sawn into two pieces, each 12in. by 4½in., and bolted together at every 4ft. or 5ft. by ⅞in. screw bolts?—F.

[901.]—VENTNOR HOSPITAL COMPETITION.—The public—even the BUILDING NEWS perusing public, and their name is legion—still lack a desideratum, *i.e.*, the cognomen of the chosen one in the above competition. Can you, or will "the powers that be," supply the above? and oblige, amongst others, yours pertinently and respectfully—F.

[902.]—STRENGTH OF CYLINDERS.—Allow me to ask for a rule for determining the strength of hollow iron cylinders of a circular form, as I have not been able to find a rule in any book.—P. S.

[903.]—CONTENTS OF CISTERNS.—Will any of your contributors to "Intercommunication" solve the following question for me? I have a cistern, irregular in plan,



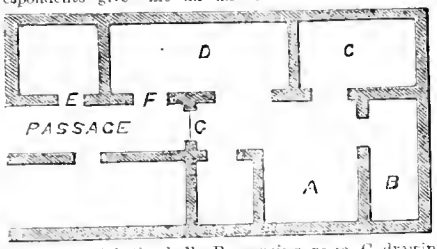
as shown in the figure, and of a depth of 4ft. How much water does it hold when full?—INQUIRER.

[904.]—MOIST WATER COLOURS.—I should be much obliged if some one would inform me what is used with which to mix the above. I have mixed them with water, and added a little gum, but that did not answer.—E. F.

[905.]—GAS TABLE STOVES.—The advantages of gas stoves, especially in warm weather, are too obvious to require any comment. When gas is laid in a house they can easily be made use of; but there are many houses, both in town and country, into which gas has not been introduced, and there they are unavailable, unless an apparatus be attached to them for generating gas. This can easily be done, as is shown by the great variety of portable gas lamps for lighting purposes now manufactured; but I have not been able to find any gas stoves with such apparatus, and I will feel much obliged if you, or any of your correspondents, would inform me where an article of the kind is to be had. Spirit lamps answer the purpose so far; but they are too expensive for general use; and, besides, they do not admit of the flame being regulated according to the degree of heat required. I have spoken about this to several gas engineers, but none of them appeared to see the importance of it, though I feel satisfied that if an article of the kind, not too expensive, were brought out it would command a very large sale.—A LODGER.

[906.]—STATUES NEAR THE FOREIGN OFFICE.—At each of the angles of the Park side of the Foreign Office are statues of four very elegant and unusually tall men, whom I take to be statesmen, dressed in flowing robes, such as George the Fourth, gentleman and king, is generally represented as wearing. Might I ask who these are supposed to be? Also, alongside of them, but somewhat ungallantly shelved upon the cornice of the wings, are being fixed four ladies, in a costume with which I am not familiar; two of these are facing the Park, and two are just round the corner. Are these the wives of the gentlemen in the niches beneath? and are they dressed in court costume? Excuse this inquiry, but not having had the honour of being presented myself, I am ignorant upon the point. If the ladies and gentlemen are not so connected, I am at a loss to understand their juxtaposition.—A YOUNG MAN FROM THE COUNTRY.

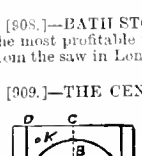
[907.]—DOOR JAMBS.—Could you or any of your correspondents give me an answer to the following



question? A is the hall, B morning room, C drawing room, D dining room, E and F are two doors into the dining room, one in the principal hall and one in the passage to the kitchen, and G is a door dividing the hall and passage. Now as all the doorjambs leading into the hall are pitch pine, framed, panelled, and stop chamfered, I wish to know whether the doorjambs at E ought to be pitch pine, framed, panelled, and stop chamfered the same as F; or ought they to be the same as the jambs to the other doors in the passage, which are plain red deal.—CLERK OF WORKS.

[908.]—BATH STONE DUST.—I wish to know what is the most profitable way to dispose of Bath stone dust made from the saw in London, I having no use for it.—SAWYER.

[909.]—THE CENTRE OF GRAVITY.—Will any correspondent kindly inform me through the "Intercommunication" column of a simple method of finding geometrically and mathematically the centre of gravity K of half a semi arch, A B C D? At page 833 in "Rutherford's Mathematics" is given a good way of finding the thickness of the pier when the position of K is known, but it does not



show how to find K.—X. + Y.

[910.]—ASPHALTE AND GRAVEL.—I have to superintend the laying of a barn floor, which is to be composed of asphalte and clean gravel, and finished with a layer of asphalte ¼in. thick. Will anyone kindly inform me what are the proper proportions of asphalte and gravel in the under stratum; and whether it should be laid down while the asphalte is hot? Also whether the thin upper layer should be of pure asphalte, or mixed with small stones in any proportion, and at what temperature it should be laid down? Of course the upper surface is required to be perfectly smooth and even.—Y. O.

[911.]—STAINING BRICK.—I have in course of erection a number of cottages built of red brick. Could you or any of your readers give me the recipe bricklayers use for colouring and pointing the bricks, so as to give them the bright tint so usually given to tuck brickwork.—TOM.

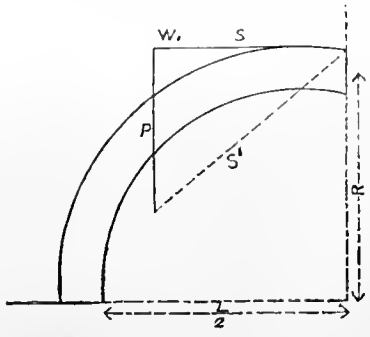
[912.]—FRESCO.—I have painted a picture on a wall in the summer-house, which I find is being damaged by damp. Will some one kindly inform me of the most effectual way of preventing it? I have soaked the wall with boiled oil, and sized it.—H. L. G.

REPLIES.

[886.]—MAKING A POND.—I do not quite understand the question of "S. W." Does he intend lining the whole of the bottom and sides of his pond in bricks or tiles laid in cement? If so it will cost a round sum. He would find it much cheaper to do as they are doing with the ornamental waters in Regent's Park and line his pond with a layer about 3in. or 4in. in thick-

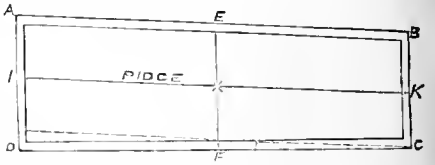
ness, of cement concrete. Let him make his pond in section as shown in the annexed cut, with the side slopes at a batter of 2 to 1, or 2½ to 1, according to the nature of the ground; or he might line it with Seyssel asphalte instead of concrete.—A. W.

[890.]—SEMICIRCULAR IRON ROOF.—"Young Engineer" would not gain anything by using timber laminated ribs for his roof, in an economical or constructive sense, and would, moreover, expose his roof to the chance of fire.



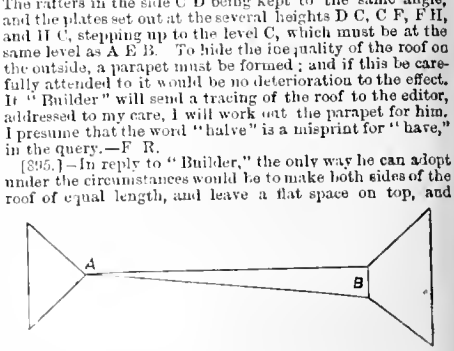
He had better make it of iron, and may calculate the strain by the aid of the annexed diagram, which represents an elevation of one half the arch, the strain upon the other half being identical and counterbalancing. If we put W to equal the total load brought upon the arch, including that of the arch itself, R to equal the rise to the centre of the depth, and L to equal the span, then calling the strain at the centre S, we have $S = \frac{W \times L}{S \times R}$. To find the strain at any other point, such as at P (see diagram), let W_1 equal the weight of that portion of the arch and load between P and the centre. The actual strain at P is equal to S', and is manifestly by the diagram the hypothenuse of the right-angled triangle, of which the other sides are equal to W_1 and the central strain S. Consequently $S' = \sqrt{S^2 + W_1^2}$ which gives the strain at any other point of the arch, except the centre.—CALCULATOR.

[895.]—A TAPERING ROOF. In answer to the query of "Builder," the best way to set out his tapering roof, so as to keep an apparent level, would be as shown on diagram.



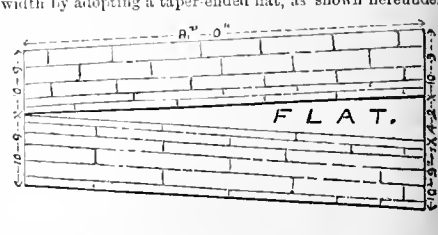
Let A B C D be the size of hall; bisect the length at E F, and set E × F truly on the wall as the centre truss; then set out the ridge I × K parallel to the raking side A E B; The rafters in the side C D being kept to the same angle, and the plates set out at the several heights D C, C F, F H, and H C, stepping up to the level C, which must be at the same level as A E B. To hide the inequality of the roof on the outside, a parapet must be formed; and if this be carefully attended to it would be no deterioration to the effect. If "Builder" will send a tracing of the roof to the editor, addressed to my care, I will work out the parapet for him. I presume that the word "halve" is a misprint for "have," in the query.—F. R.

[895.]—In reply to "Builder," the only way he can adopt under the circumstances would be to make both sides of the roof of equal length, and leave a flat space on top, and



cover it with lead or any other metal, A being the narrow and B the wide end of the building. I have seen this method adopted without in the least injuring the effect of the building.—HOWELL.

[895.]—I should say the difficulty might readily be overcome by keeping plates level as desired, and rafters of equal length, in the usual way, overtaking the difference of width by adopting a taper-ended flat, as shown hereunder.



This secures a general uniformity, with the exception of the wide gable, the coping of which may easily be continued to a point. Where the difference of width is great, queenpost construction would be necessitated at the widest part; but, if trifling, simply blocking off the purlin from principals, framed at somewhat less pitch, would overcome the difficulty, especially if the framing was invisible internally.—F.

[897.]—ARCS OF DIFFERENT RADII.—The best way for "Howell" to proceed would be to lay out the curve he wants by means of offsets upon a platform, and then bend the stick to it, and keep it in its place by a tie, and if necessary by some small kind of bracing or trussing.—A. Z.

[898.]—WELL DIGGING.—Under the above title, I conclude your correspondent means the cost of actually constructing the well, and not merely excavating the stuff, which would be but a very inconsiderable item, as may be easily shown. In the example given the depth of the well is 30ft., and the diameter 10ft. The number of cubic yards in the whole well would be represented by the equation, putting N for the number: $N = \frac{\pi d^2}{4} \times \frac{30}{27}$ equal to $\frac{0.7854 \times 16 \times 30}{27} = 14$ cube yards. To find all materials and steen the well would cost about 8s. 6d. per foot, as an average estimate.—W. W.

[898.]—Your correspondent wishes to know the price of sinking a well 30ft. deep. I would suggest that he have the quantities taken out, and ask a dozen respectable firms to give him tenders for the work. He may get the information required in this way.—D. E. F.

WAGES MOVEMENT.

THE operative joiners of Crieff, after being out for a week, have returned to their work at the former wages. The advance asked was 1s. 6d. a week, which the employers unanimously refused to give; and, owing to the want of unanimity on the part of the men, the strike has terminated.

The bricklayers and others engaged in the building trade at New York are at loggerheads with their employers. The

bricklayers refuse to work more than eight hours a day, and the masters express the most fixed determination to oppose them in this action, resolving not to employ any bricklayers who are unwilling to work ten hours a day.

STATUES, MEMORIALS, ETC.

FROM 8,000 to 10,000 persons were present on Saturday at the inauguration of the Cobden memorial statue at Camden Town. Speeches were delivered on the occasion. Mrs. Cobden and three daughters witnessed the ceremony.

LAND AND BUILDING SOCIETIES.

THE seventeenth annual meeting of the Perpetual Investment and Building Society was held on Wednesday evening at Radley's Hotel, New Bridge-street, Blackfriars; Mr. Daniel Pratt in the chair. The report, which was unanimously adopted, stated that the business of the past year yielded a much larger divisible profit than in any previous year. 1,609 new shares having been issued. The amount invested on realised shares, inclusive of capitalised interest, to the 30th of April last, was £102,407 17s. 6d., while the balance remaining invested on subscription shares, with the accumulation of interest and bonuses, was £146,339 6s. 2d. The deposits with the society at 3 per cent. were £18,689 1s. 4d. The advances of the year amounted to £72,338 19s. 6d., making the total since the commencement of the society, £702,305 8s 2d. The sum of £15,871 1s. 11d. was received for interest upon loans during the year, and the balance remaining due upon loans was £224,678 12s. 7d. fully secured. Considerable attention had been paid to the improvement of the estates at East Dulwich and Benhill, and estates had been secured at Beddington, Epsom, and Muswell-hill, portions of which will be offered from time to time. The members were congratulated from the chair upon the solidity of the society, which for the past four years had divided 10½ per cent. in bonuses and interest, and upon the fact that its business was as well managed and as safe as the Bank of England.

LEGAL INTELLIGENCE.

PRESERVATION OF HAMPSTEAD HEATH.—At the Court of Chancery, on June 24, before the Master of the Rolls, the case of Hoare v. Sir Thomas Maryon Wilson, Bart, came on for hearing. This case was instituted by Mr. John Gurney Hoare, Mr. Richard Ware, and Mr. Isaac Solly Lister, on behalf of themselves and all other copyhold tenants of the manor of Hampstead, against Sir Thomas M. Wilson, Bart., the lord of the said manor, for the purpose of obtaining a declaration by the Court that the copyhold tenants of the manor are entitled among other things to common of pasture upon Hampstead Heath and the adjoining waste lands, and to use the said heath and waste lands for enjoyment and recreation by walking, driving, riding on horseback, and carrying on lawful sports, games, and pastimes therein at all reasonable times. The plaintiffs also sought to restrain the defendant from selling, carrying away, and digging up, except for the proper use of the demesne of the manor, any turf, sand, &c., and from proceeding with the messuage and buildings now in course of erection thereon, and from suffering the said buildings to remain thereon, and from erecting any other houses or buildings upon the heath, and from in any manner interfering with the rights of the copyholders. The plaintiffs also sought to make the defendant account for sand, loam, gravel, and other materials which he had dug up and sold from the heath in derogation of the rights of the copyholders, and if necessary to have a proper scheme settled to regulate the exercise of the copyholders' rights in the heath and waste lands. Sir R. Palmer, Mr. Joshua Williams, and Mr. Speed were for the plaintiffs; and Mr. Jessell, Mr. Bagallay, and Mr. Eddis, for the defendant; Mr. Bedwell and Mr. Burt were for the trustees of the will of the late Sir Thomas Wilson. The case was only part heard when the Court rose.

WHAT IS JOINER'S WORK? — BEDFORD *v.* DAVIES.—The plaintiff, who is a carpenter, residing at Hereford, sued the defendant for a sum of £7, for work done to a cottage in the possession of the defendant. The work was originally agreed to be done for £7, but on commencing it he found more required to be done than he supposed, but the defendant told him to go on, as "he should not lose a penny by it." The plaintiff had his work valued by Mr. Morgan, builder, who assessed it to be worth £9 18s., including the extra joinery work. The defence was, first of all, that the work he would have to do was clearly pointed out to the plaintiff prior to the agreement being signed; and, secondly, that the joinery was to be included in the lump sum agreed upon. Professional witnesses, both builders, were called, and proved that all the work performed by the plaintiff came legitimately, in a cottage of the size, within the scope of the carpenter, and could not in any way be said to be joinery. After a long investigation the judge found for the defendant.

Our Office Table.

The new Law Courts business may now be regarded as finally settled. After the decision in the House of Commons this week it will be useless for Mr. Barry or anyone else in or out of Parliament to attempt to disturb the arrangement. Had the matter been remitted to a select committee, as moved by Mr. Goldsmid, it must not be supposed that, if it resulted in displacing Mr. Street, the name of Mr. Barry would be substituted. In all probability the whole matter would be reconsidered—not merely who should be the architect, but what should be the site. There is no denying that the Thames Embankment is the favourite spot, as far as public opinion is concerned; and if the question were reopened before a select committee, the newspapers would be advocating that site as the best; and if that site were chosen a new plan must be provided. Who would provide that plan? Mr. Street is selected, not because his plan is best, but because, in the opinion of the Government, he is the best architect for the purpose. The best thing now to be done is for Mr. Barry and Mr. Street to shake hands and wish each other good speed in the erection of the works they are respectively chosen to superintend.

We have received the following in answer to a paragraph in our last number:—"Sir,—I see in last week's BUILDING NEWS a little bit of virtuous sarcasm as to the balance-sheet of the Liverpool Architectural Society, and the disproportion between the sum paid for "coffee, &c.," and that expended on students' prizes. Permit me to explain that the four guineas appearing for the latter item does not represent all that has been spent, as there are prizes given by individual members also, and that the sum mentioned for the "&c.," which seems to have shocked you so much, extends over nearly two years, and stands for refreshment necessarily provided for members who mostly live out of the town and cannot go home before attending the meetings. The attendance at our society being, I believe, much larger than in most similar societies in the provinces, the "provision bill" is necessarily in proportion.—Yours respectfully, H. H. STATHAM, jun., Hon. Secretary of the Liverpool Architectural Society."

The arrangements have been made for beginning the new East London Museum at Bethnal Green, and the foundation is to be laid in three weeks with much display. An endeavour is being made by the supporters to obtain the presence of the Prince of Wales. There are to be cheap refreshment rooms and reading room, with every requisite to make the museum a working man's evening institute to compete with the pot-house.

The buffet exhibited by Messrs. Graham, of Oxford-street, at the Paris Exposition, is not yet complete. Workmen of all nations are still engaged upon it, and its total cost, it is said, will exceed £5,000, of which the design counts for £700.

A curious and good practical exhibition could be got up at South Kensington if the authorities could obtain working drawings from the great cabinet makers, silversmiths, &c. Such houses as Hunt and Roskell, Lambert, &c., could show drawings from leading painters and sculptors. The collections of some firms have cost large sums of money.

At the last meeting of the Architectural Association, on the 19th ult., the following office bearers were elected for the ensuing session of 1868-9:—Mr. William White, F.S.A., President; Vice-Presidents, Messrs. Ridge and T. H. Watson. Committee: Messrs. Carpenter, Henman, jun., H. Jarvis, jun., H. W. Lonsdale, Perry, R. Plumbe, R. P. Spiers, E. J. Tarver, Aldridge, and G. R. Redgrave. Honorary Secretaries: Messrs. J. D. Mathers and J. Quilter. Curators and Librarians: Messrs. G. Birch, R. Armstrong, and T. E. Munday. A paper was afterwards read by Mr. T. Wells on "The Influence of Eastern on Western Art, as seen in the Art Results of the Crusades."

A new officer is about to be appointed by the corporation to make periodical and systematic surveys of the City property. The selection of five from the candidates who apply will rest with the joint committees of City Lands and Bridge-house Estates. The salary is £100 per annum.

The third portion of the Thames embankment on the Middlesex side of the river was commenced on Monday under the direction of Mr. Cooke, who manages the contract for Mr. W. Webster. The work extends from the Temple to Blackfriars Bridge, and although there are many engineering difficulties in the way, the undertaking must be completed in a year, according to the terms of the contract. The section of the embankment in the neighbourhood of Hungerford Bridge seems to be much more backward than recent official promises led the public to believe it would be.

S. Taylor, Esq., member for St. Pancras, has been unanimously elected deputy chairman of the Building Act Committee of the Board of Works, and W. Newton, Esq., member for Mile End, deputy chairman of the special gas committee.

The new street forming the western approach to the New Meat and Poultry Market has been opened for traffic as far as Farringdon-road, parallel to which, with a slight incline, a temporary macadamised road runs to the bottom of Holborn-hill and Farringdon-street.

In the division in which Mr. Goldsmid's motion for referring the claims of Messrs. Street and Barry to a select committee was rejected, the members of the Government voted in the majority. In fact, it seemed to have been made a ministerial question, for Messrs. Noel and Whitmore acted as tellers. Several Liberals voted with the Government. The minority was composed mostly of Liberals. Mr. Pease, a relative of Mr. Waterhouse, acted as co-teller with the hon. member for Honiton.

A meeting has been held at Leighton Buzzard, under the presidency of Lord Charles Russell, for the purpose of taking steps to establish an institution in memory of Sir Joseph Paxton, who was born at Milton Bryan, a village in close proximity to the town. A subscription list was opened, and a resolution passed stating the opinion of the meeting that the building should "present some decided architectural features," and it was suggested that ornamental ironwork might be effectively employed in its construction, so that its general character might accord with the ideas by which the genius of Paxton was illustrated. The building is to contain a museum, a library, a reading room, and rooms suitable for lectures and classes.

A few old New Zealand colonists now resident in England assembled at No. 37, Eaton-square, on Wednesday afternoon, for the purpose of presenting a pastoral staff to the Bishop of Lichfield (who sailed for New Zealand yesterday). The staff, designed and executed by Messrs. Cox and Son, of Southampton-street, Strand, is of massive silver, with the top crocketted and jewelled, the knob below the crook pinnacled and richly chased, and the stem of polished ebony, with silver bulb and base.

On Saturday last the two last girders of the viaduct across the Solway Firth, which forms the chief engineering work on the Solway Junction Railway, were laid by Mr. Brogden, of Ulverstone, the chairman of the directors. The bridge is 1,910 yards in length, and, with its sea embankments at each end, forms a road across the sea nearly two miles in length. 1,800 tons of wrought iron and 2,900 tons of cast iron have been used in its construction. The bridge is formed upon iron piles screwed and driven into the subsoil, and the work is one of great solidity. This new railway bridge will form a new connecting link between England and Scotland.

The results of the recent examination of the works executed in the Kidderminster school of art are of a most satisfactory nature, and prove that this school has done far better than any other in the kingdom, taking the number of students into consideration. Out of fifty students, five national awards were taken, four free scholarships, and seven third-grade prizes. The drawings of fifteen students were commended, and thirty-four students obtained prizes and certificates in the second grade. Ninety per cent. of the students obtained some mark of success, and it is also worthy of note that the principal national awards were taken each year by different students.

The forty-second anniversary dinner of the United Society of Ironmongers was held on Monday evening at the Freemasons Tavern. About 150 gentlemen sat down to dinner. In the course of the evening Mr. Tidd Pratt, reply-

ing to the toast of his health, said that some friendly societies were good and others swindles. Among the latter were to be classed more particularly some burial societies which insured people from one day to eighty years old. They had agents throughout England, Scotland, Ireland, and Wales. One in Liverpool bragged that it had 500,000 members, and the expenses of that society were enormous. It received yearly in shillings and pence £130,000. The committee consisted of eight members, and, according to the return made to Parliament, each of those gentlemen received £454 a year (sensation), or 29s. a day, for his services. That statement had since been corrected by a gentleman, who said that that amount had been increased to £520 a year, or £10 a week. The treasurer received £650 or £670; and he (Mr. Tidd Pratt) considered this a downright swindle of the poor man, because it was utterly impossible that if the society's affairs were wound up the various members could receive what they were entitled to. The Society of United Ironmongers contrasted favourably with this; for out of the 24,000 societies, which were all going concerns, and were, he might say, in his office, there was not one could show such a balance-sheet as the Society of Ironmongers.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

3327 F. BROWN. Improvements in Kitchen Ranges. Dated November 25, 1867.

This invention is more particularly applicable to what are known as close fire ranges when the range is made with an oven on one side of the fire and a boiler at the back; or when made without any boiler the patentee heats the oven or ovens by two distinct flues from the fire. First, the top of the oven is heated by a flue from the fire passing over it; this flue has an outlet into the chimney, and the draught is regulated by a damper in the usual manner. Second, the bottom, back, and side of the oven farthest from the fire are heated by a flue passing, by preference, from the bottom of the fire, or from the side of the fire close to the bottom; this flue passes under the oven, and rises at the back or side, or both, and then up the same outlet to the chimney as the flue which passes over the top of the oven; or it may have a separate outlet or outlets to the chimney, and the draught may be regulated by an independent damper or dampers. The side of the oven next the fire is heated in the ordinary manner by its close proximity to the fire, and is protected as usual with a firebrick or iron shield to prevent it becoming overheated. —Patent completed.

3354 C. COATES. Improvements in Machinery for Cutting or Dressing Stone, and in Apparatus connected therewith. Dated November 27, 1867.

This invention consists in improved machinery for cutting and dressing stone by means of circular discs or tools, or their equivalents, the discs being mounted and working in the manner described and shown in the drawings, and constituting a dressing stool or instrument of a new character. The stone intended to be dressed is placed on a movable table to which a reciprocating motion is given, so as to bring the stone under the operation of the dressing stool. In some cases the stone may be supported upon a table, and a reciprocating motion is given to the dressing stool in the manner described. The invention also relates to apparatus for sharpening the operating edges of the discs forming the dressing stool by grinding them in the manner described. The invention is not fully described apart from the drawings.—Patent completed.

3355 J. H. JOHNSON. Improvements in the Construction or Arrangement of Piles or Faggots for Wrought-iron Beams, Girders, or Bars of Different Forms. (A communication). Dated November 27, 1867.

The patentee claims, first, the construction and use of a pile or faggot composed of one or more bars for the web, and any appropriate number of bars for the flange or flanges, the said bars being arranged and permanently secured together by rivets or bolts, substantially as described and illustrated in the drawings. Second, the construction and use of a pile or faggot composed of one or more bars for the web for each flange, the whole being held together by rivets or bolts, substantially as described and illustrated in the drawings. Third, the construction and use of a pile or faggot composed of one or more bars for the web, and any desired number of bars for the flange or flanges, the said bars being arranged and permanently secured together by rivets or bolts, substantially as described and illustrated in the drawings. Fourth, the construction and use of a pile or faggot (for cruciform and other shaped beams or girders) composed of bars arranged and secured together by clamps, substantially as described and illustrated in the drawings. Fifth, the construction and use of a pile or faggot composed in part of a solid bar or bars with a rib or ribs, and in part of bars riveted together and wedged to the said rib or ribs, substantially as described and illustrated in the drawings. Sixth, the construction and use of a pile or faggot consisting of a solid bar or bars having a rib or ribs confined between bars by riveting the same to any desired number of intervening bars whose aggregate thickness is less than the said rib or ribs, all substantially as set forth in the specification and drawings.—Patent completed.

3361 J. S. SMITH. Certain Improvements in Apparatus for Ventilating Buildings and other similar purposes. Dated November 27, 1867.

The patentee claims the use and application of a movable cap, cover plate, or equivalent for opening and closing the upper end of air shafts used as ventilators, for the purpose of excluding dust, dirt, and extraneous matters, irrespective of the form thereof, or of the mechanical means employed to effect their rise or fall. Second, the general construction, arrangement, and combination of the apparatus for the purpose, as described.—Patent completed.

3377 J. H. JOHNSON. An Improved Hollow Brick or Block to be used for the Floors, Ceilings, and other parts of Buildings, and Apparatus for Moulding or Manufacturing the same. (A communication). Dated November 28, 1867.

According to this invention it is proposed to construct, in suitable moulds, hollow bricks or tiles of plaster, cement, or other suitable material, of a square, rectangular, or other form. These blocks are perfectly closed up on all sides, although made cellular or hollow internally; consequently, the plaster employed in setting them in their place, between the joints cannot possibly obtain access to the interior of the blocks. Ribs or projections are moulded along the several sides or edges of these closed hollow blocks, in order to afford a better hold to the plaster or cement, which is introduced between them when setting the same, and the top and bottom faces of the blocks are roughened or made uneven to form a key or holding surface for the adhesion of the coating or plaster employed in furnishing the floor or ceiling.—Patent abandoned.

3397 J. J. PARKES. Improvements in the Means of Ventilating Rooms and Buildings, and in Apparatus for the same. Dated November 29, 1867.

These improvements are chiefly applicable to such houses or buildings as are provided with a circulation of hot water. In carrying out the invention the patentee encloses a tube or series of tubes in a casing forming an air space, and placed above the chamber to be ventilated, the said tube or series of tubes being heated by the hot water circulating through them. The casing is placed in communication with the chamber to be ventilated by means of a tube terminating in a grating placed in the wall of the chamber. The upper end of the outer casing is connected with a pipe leading out into the open air, where it is surmounted by a cowl. The rarefaction of the air surrounding the heated tube or tubes, and contained in the outer casing, causes the air to ascend and escape into the atmosphere by means of the pipe and cowl above mentioned, thus forming a partial vacuum in the pipe below the heated tubes, the air in the chamber being drawn off through the grating to supply its place—thus effecting a continual ventilation of the chamber, so long as the tubes are kept heated.—Patent completed.

3404 S. E. STEANE. Improvements in Globes and Glasses for the Transmission of Artificial and other Light. Dated November 30, 1867.

Here the inventor makes the globe of a double thickness of glass, presenting a convex form both on the outside and inside, and having a hollow space between to contain water or other liquid or fluid for increasing, by its refractive and reflective power, the light encircled by said globe.—Patent abandoned.

3413 J. C. WOOLFIELD. Improvements in Boilers for Supplying Hot Water to Apparatus for Heating Buildings. Dated December 2, 1867.

This boiler may be cleaned internally without disturbing the outer shell, or any of the pipes or other apparatus attached thereto. It is formed by an outer shell and an internal flue tube connected together, or cast in one piece. The union between the shell and flue tube is at the end nearest the fire doors; the flue tube is closed at the end furthest from the fire doors, called by the patentee the "back end;" on the "back end" of the shell is a flange, to which is attached by bolts a lid, and on removing this lid the interior of the boiler may be cleaned. The flue tube is divided into three divisions, namely, first, the ash-pit or lowest division; second, the furnace, or middle division, which is enclosed by fire doors and contains the grate and deadplate; third, the return flue or highest division which is in direct communication with the funnel or smoke pipe. When of a circular form, the boiler is supposed to be horizontally in a line parallel to its longer axis.—Patent completed.

Trade News.

CONTRACTS.

TO BUILDERS, CONTRACTORS, and Others.—The Metropolitan Board of Works Hereby Give Notice that they will meet at the office of the Board, Spring Gardens, S.W., on Friday, July 17, 1868, at twelve o'clock at noon precisely, and will then be prepared to open TENDERS by parties who may be willing to CONTRACT for the CONSTRUCTION of a certain intended BRICK SEWER, 1,78 ft. in length, or thereabouts, with other works in connection therewith, on Brook Green lane, between Brook Green and Broadway, in the parish of Hammersmith, in the county of Middlesex. Parties desirous to submit tenders may inspect drawings and, upon payment of 5s., obtain specification, form of tender, and other particulars on application to Mr. J. W. Bazalgette, engineer of the Board, at the office, Spring Gardens, between the hours of nine a.m. and four p.m., or on Saturdays between the hours of nine a.m. and two p.m., until Thursday, July 16, 1868. The tenders, which must be on the form supplied from the office, and addressed to the clerk of the Board, are to be delivered at this office before four o'clock on the last mentioned day, and no tender will be received after that hour. The parties tendering must be in attendance at the Board at twelve o'clock on the day appointed for opening tenders, and any tender which is not fully filled in in every particular will be rejected. The Board do not bind themselves to accept the lowest or any tender.

JOHN POLLARD, Clerk of the Board.

Spring Gardens, S.W., June 27, 1868.

METROPOLITAN BOARD OF WORKS. To BUILDERS, CONTRACTORS, and others.—The Metropolitan Board of Works Hereby Give Notice that they are prepared to receive TENDERS for the ERECTION of a FIRE BRIGADE STATION in Renfrew-road, Lower Kennington-lane. Parties desirous to submit tenders may on and after Monday, July 6, upon payment of 30s., obtain drawings and specification, form of tender, and other particulars on application at the office, Spring Gardens, between the hours of nine a.m. and four p.m., or on Saturdays, between the hours of nine a.m. and two p.m. The tenders must be upon the forms supplied from this office, and sent under cover addressed to the Clerk of the Board marked on the outside, "Tender for Fire Brigade Station, Renfrew-road, Lower Kennington-lane," and no tender will be received after four o'clock p.m. on Monday, July 20, 1868. The Board do not bind themselves to accept the lowest or any tender.

JOHN POLLARD, Clerk of the Board.

Spring-gardens, S.W., July 1, 1868.

NORTH-EASTERN RAILWAY.—DARLINGTON SECTION.—To BUILDERS.—TENDERS are required for the ERECTION of a GOODS WAREHOUSE and OFFICE, at Redcar, and two Dwelling-houses, at Saltburn-by-the-Sea. Plans and specifications can be seen at the offices of Mr. Wm. Peachey, architect, Darlington, from Monday, June 29, to Saturday, July 11, 1868. Tenders to be delivered on or before Monday, July 13, addressed to the secretary, and endorsed "Tender for Works." No pledge is given that the lowest or any tender will be accepted.

(Signed) T. MACNAY, Secretary.

Darlington, June 25, 1868.

TO BUILDERS and CONTRACTORS.—CHESHIRE NEW COUNTY ASYLUM.—Persons disposed to TENDER for the ERECTION of the above-named building, at Parkside, near Macclesfield, may inspect the plans and specifications at my offices, in Stafford, or duplicates of the same at the Clerk of Works office on the site, on and after Monday, June 29, until Saturday, July 25, 1868. Bills of quantities may be obtained at my office, on payment of a deposit of £5 5s. for each copy, which will be returned on receipt of a *bona fide* tender for the works. Part of the foundations are already laid, and will be counted up to ground line by the present contractor. Tenders, on the lithographed forms only, must be delivered at the office of the Clerk of the Peace, Chester, by ten o'clock a.m. on Monday, July 27, 1868. Sureties will be required for the due completion of the works, but no pledge is given that the lowest or any tender will be accepted.

ROBT. GRIFFITHS, Architect.

3, Martin-street, Stafford, June 20, 1868.

FULHAM UNION. — GRANITE SUPPLY.—Notice is Hereby Given that the Guardians of the Poor of the above-named Union are willing to receive PROPOSALS for the SUPPLY of 1,000 tons of the BEST UNBROKEN BLUE GUERNSEY GRANITE, to be delivered, free of charge for delivery, into the Stone Yard of the Union Workhouse, before September 29 next. The contractor will be required to enter into a contract and bond, with two sureties, whose names and addresses must be stated in the tender. Tenders, sealed and endorsed "Tender for Granite," are to be sent to my office on or before July 8 next, and parties making proposals, or their agents, are expected to be in attendance at the meeting of the Guardians at twelve o'clock at noon, on Thursday, July 9, when the tenders will be opened. The Guardians do not bind themselves to accept the lowest or any tender.

By Order,

T. APLIN MARSH, Clerk to the Guardians.

Clerk's Office, Fulham Union Workhouse,
Hammersmith, W., June 18, 1868.

MANCHESTER NEW TOWNHALL.—TO CONTRACTORS.—TENDERS, by Schedule of Prices, are required for the EXCAVATOR'S WORK on the site of the new Townhall. Lithographed forms of tender can be obtained at the office of the architect, Royal Insurance Buildings, Manchester. Tenders to be delivered at the Townhall, Manchester, addressed to the Chairman of the Building Committee, and endorsed, "Tender for Excavations of the new Townhall," not later than ten a.m. on Thursday, July 9, 1868.

July 2, 1868. ALFRED WATERHOUSE, Architect.

IMPORTANT SALE of BRICK and TILE WORKS.—The well-known and extensive works at Bishop's Waltham, Hants, now in full operation, and producing blue bricks, stable paving, and odd stuff, equal in quality to the best Staffordshire, as well as all kinds of red, white, and buff goods, and now supplying the facing bricks for the Metropolitan Main Sewers (south London) are for SALE by TENDER. The works comprise one of Hoffman's patent German kilns, in addition to eight others. Forms of tender (which are to be sent in before August 15), together with conditions of sale, and full particulars, may be obtained of Richard Hall, jun., Esq., 37, Great George-street, Westminster; J. N. Brown, Esq., 56, Union-passage, Birmingham; and Messrs. Parke and Pollock, 63, Lincoln's Inn fields, W.C. London depot, Nine Elms Station.

MAIDSTONE LOCAL BOARD.—BROKEN GUERNSEY GRANITE.—The Local Board of Maidstone are prepared to receive TENDERS for 4,0 tons of BROKEN GUERNSEY GRANITE, to pass through a 2in. ring, to be delivered alongside the Board Wharf at Maidstone. Further particulars (if required) may be obtained on application to Mr. E. Buckham, Borough Surveyor. Sealed tenders endorsed "Tender for Broken Granite," and addressed to the Chairman of the Board, to be sent in on or before Tuesday, July 28, 1868. The Board do not bind themselves to accept the lowest or any tender.

EDWARD HOAR, Clerk to the Board.

Maidstone, June 30, 1868.

LYNTON ST. MARY.—TENDERS are required for the first portion of work in RESTORING ST MARY'S CHURCH, Lynton, near Barnstaple—namely, the erection of a new chancel. Drawings, specifications, and conditions of contract may be seen on application to the Rev. W. L. Lawson, at the Parsonage, and copies of same at my office, where all tenders are to be sent by, or, before July 11 inst.

EDWIN DOLBY, Architect.

8, St. Helen's, Abingdon, July 2, 1868.

Just Published, Imperial 4to, half bound in morocco, £3 10s.,

VILLA AND COTTAGE ARCHITECTURE,

SELECT EXAMPLES OF COUNTRY AND SUBURBAN RESIDENCES RECENTLY ERECTED, with a Full Descriptive Notice of Each Building.

Thirty Villas and Cottages, the Works of Nineteen different Architects, are Illustrated by Plans, Elevations, and Sections, together with occasional Perspective Views and Details. The buildings are fully described, and in nearly every case a statement of the actual cost is given.

London: BLACKIE and SON, 44, Paternoster-row.

TO BUILDERS. — Persons willing to TENDER for the ERECTION of a DETACHED HOUSE and a Pair of Beh-hed Villas on the Kenley estate, may send their names to John Young, Esq., Kenley House, Croydon, Surrey.

BUILDING PLOTS. — Stangate-street, Lambeth, Surrey, near Westminster Bridge.—To BUILDERS, BREWERS, PUBLICANS, &c.—To be LET by TENDER several PLOTS of GROUND on Building Leases. For printed particulars and plan (price 2s. 6d.) apply to Mr. Thomas Mills, 28, York-street, Westminster, S.W. The owner does not pledge herself to accept the lowest or any tender. Tenders on July 15.

Second edition, 4s. 6d., cloth,

A CLUE to RAILWAY COMPENSATION for Property and Person, Compulsory Sale under special Acts, the nature and value of estates, and the principles of parochial assessment. With Notes, and a Supplement founded on recent authorities. By Thomas Morris, Architect. Also,

DILAPIDATIONS, ECCLESIASTICAL and GENERAL: their nature, and the principles of assessment succinctly demonstrated. With an Appendix on party walls and statutory regulations. 4s. cloth.

London: SIMPKIN, MARSHALL, and Co.

COLLING'S ART FOLIAGE, for Sculpture and Decoration, royal 4to, 72 plates, with letterpress and numerous woodcuts, price 30s., or 36s. when ordered direct from the Author. London, published by the Author, 156, Hampstead-road, N.W.

TO BUILDERS.—DULWICH ESTATE.—The Governors are prepared to LET, on lease for 84 years, PORTIONS of their ESTATE for building purposes. There is ample railway communication, and special educational advantages in the new college are secured to occupiers of houses on the estate.—For plans and particulars apply to Charles Barry, Esq., 1, Westminster-chambers, Victoria-street, S.W., architect and surveyor to the Governors.

FREEHOLD LAND.—To be SOLD by TENDER, the FREEHOLD GROUND and the houses, Nos. 49 and 50, Cow Cross-street and the four houses in Union-place in the rear, occupying an area of about 3,000 superficial feet, with frontage of about 29ft. in Cow Cross-street, 54ft. at back, and a depth of nearly 70ft. The completion of the new Smithfield Market and Holborn Viaduct will render this locality specially suitable for warehouse or manufacturing purposes. Tenders to be delivered on July 11, 1868, at twelve o'clock, to Messrs. H. and J. D. Mathews, architects and surveyors, 10, Cloak-lane, City, of whom further particulars may be obtained.

ELIGIBLE BUILDING LAND to be LET, for College or Villa Residences. Low ground-rent, and liberal advance if required.—Apply to Mr. J. T. Newman, 106, Fenchurch-street, E.C.

BUILDING LAND to be LET, close to Barnes Railway Station.—For particulars apply to Mr. Wood, 67, Hop Exchange, Southwark-street, S.E.

TO BUILDERS. — KENNINGTON PARK, SURREY.—SITES for Sixteen Six-roomed Houses, to be LET on Building Lease, either singly or together, at New road, Kennington Park.—For particulars apply to Mr. Hoole, architect, 16, Craven-street, Charing Cross, London, W.C.

TO GENERAL HOUSE DECORATORS and GILDERS.—To be DISPOSED OF a BUSINESS established five years as general house decorator, gilder, carpenter, plumber, gas-fitter, &c. In a very healthy and respectable neighbourhood, near Regent's Park; showy shop, with plate-glass front; convenient house, good workshops on the premises. Stock of fixtures to be taken at a valuation.—Apply to R. Axford, 8, Park-terrace, Park-road, Regent's Park.

TO BUILDERS.—A well established GENERAL BUSINESS in an improving neighbourhood, eight miles from London, for DISPOSAL. Price for goodwill, plant, stock, fixtures, &c., £1,00. Apply to John S. Ellis, surveyor, &c., 31, Nicholas-lane, E.C.

NOTICE to Bargemen, Lightermen, and Others.—Parties who may be willing to SUPPLY and DEPOSIT DRY RUBBISH or DREDGER STUFF on the eastern foreshore of the ROYAL ARSENAL at Woolwich, are invited to send in terms to the Inspector of Works, Royal Arsenal, on or before August 1, 1868. Every information will be given on application, either by letter or in person, at the Office of the Inspector of Works, Royal Arsenal, Woolwich, daily (excepting Saturdays and Sundays), between the hours of eleven a.m. and three p.m.

War Office, Pall Mall, June 8, 1868.

TO BUILDERS, &c.—Combined machine for Sawing, Mortising, Tenoning, Rebetting, Grooving, and Boring, worked by manual or steam power, £47. Write for prospectus, and see testimonials from some of the largest firms in London.—Marshall, Patentee, Union Steam Works, Union-street, Whitechapel, E.

SAW FRAME.—For SALE, a good SECOND HAND DOUBLE DEAL FRAME. Will cut 17in. deep.—S. Worssam, Jun., and Co., Manufacturers of Wood Working machinery, Oakley Works, 232, King's-road, Chelsea, S.W.

SCHWEPPE'S MINERAL WATERS. By Special Appointment to Her Majesty and H.R.H. the Prince of Wales. Every bottle is protected by a label having name and trade mark.—Manufactories at London, Liverpool, Derby, Bristol, Glasgow, Malvern.

BILIOUS and LIVER COMPLAINTS. Indigestion, Sick Headache, Loss of Appetite, Drowsiness, Giddiness, Spasms, and all Disorders of the Stomach and Bowels are quickly removed by that well-known remedy, FRAMPTON'S PILL OF HEALTH. They unite the recommendation of a mild operation with the most successful effect; and where an aperient is required, nothing can be better adapted.

Sold by all Medicine Vendors, at 1s. 1½d. and 2s. 9d. per box or obtained through any Chemist.

UNDER THE PATRONAGE OF H.M. THE QUEEN.

THE LONDON PARQUETRY WORKS, —The first Establishment founded in England (in 1842) for the exclusive manufacture of Solid and Plated PARQUET FLOORS and BORDERS, CEILINGS, and WALL DECORATIONS; and Sole Patentees of the only system adapted to the English climate, whereby the evils of DRY ROT, SHRINKAGE, and WARPING (so common to work manufactured in foreign climates), are EFFECTUALLY PREVENTED.—For designs, estimates, and list of nearly 300 floors, &c., apply to THE LONDON PARQUETRY WORKS, Grove-lane, Camberwell, S.; or to their Sole Agents, Messrs. Gillow and Co., 176, Oxford-street.

C. H. DAVIES and CO.'S

GENUINE AND ARTISTIC

SOLID PARQUET FLOORS

N.E.—Designers and Practical Joiners,

CAMBRIDGE HALL, NEWMAN STREET

LONDON.

JOURNEYMEN CARVERS' TRADE SOCIETY.—EMPLOYERS and the Trade are respectfully informed that the above society MEET every MONDAY EVENING at the Adam's Arms, Hampstead-street, Fitzroy-square. N.B.—The Unemployed List can be seen at any hour during the day.

MORTGAGES. — MESSRS. HENRY SALTER and CO. effect Mortgages on Landed Estates and House Property to any extent, and where estates are being laid out for building they undertake the needful arrangements for advances and permanent mortgages throughout.—11, Pancras-lane, London, E.C.

TO BUILDERS.—MONEY ADVANCED as the work proceeds by the BUILDERS and GENERAL ADVANCE ASSOCIATION (Limited).—Particulars and forms of application may be obtained of the Secretary.—Offices, 110, Cannon-street.

THE LIVERPOOL and LONDON and GLOBE INSURANCE COMPANY.

Offices:—1, Dale-street, Liverpool; 7, Cornhill; and Charing Cross, London.

The invested funds now amount to £3,401,055, the Fire Revenue to £836,816, and that of the Life to £259,039. The moderate rates of premium, with a guaranteed fixed bonus for the life policies of this Company, and their value as special securities to third parties, render them particularly advantageous. Whole-world leave is granted on reasonable terms and claims are paid 30 days after admission.

Fire policies falling due at Midsummer must be renewed on or before July 9.

JOHN ATKINS, Resident Secretary.

IMPROVED DWELLINGS FOR THE PEOPLE.

THE ARTISANS', LABOURERS', and GENERAL DWELLINGS COMPANY (Limited).

Capital, £250,000. Shares £10. £1 paid per Share.

PRESIDENT.—The DEAN of WESTMINSTER.

ARBITRATORS.	LOCAL COUNCIL.
Right Hon. Lord Shaftesbury.	Thos. Bazley, Esq., M.P.
Right Hon. Earl of Lichfield	Jacob Bright, Esq., M.P.
Lord Elcho, M.P.	John Cheetham, Esq., M.P.
&c., &c., &c.	W. R. Callender, jun., Esq., J.P.

W. SWINDLEHURST, Manager and Secretary.

This Company is specially formed to erect improved workmen's dwellings on the co-operative principle. No Beershop or Tavern to be erected on the Company's property. Profits realised by workmen employed on the buildings, 40 per cent. Deposits received at 5 per cent. Prospectuses sent on application, enclosing postage stamp.—Office, 147, Strand, London.

SIX POUNDS PER WEEK WHILE LAID UP BY INJURY, AND £1,000 IN CASE OF DEATH, Caused by ACCIDENT OF ANY KIND May be Secured BY AN ANNUAL PAYMENT OF FROM £3 to £6 5s. To the RAILWAY PASSENGERS' ASSURANCE COMPANY.

64, CORNHILL, and 10, REGENT STREET, LONDON

WILLIAM J. VIAN, Secretary.

CAUTION.—BLAKE'S PATENT STONE BREAKER.—IN CHANCERY.—"BLAKE v. ARCHER." November 12, 1867.—His Honour the Vice-Chancellor Wood having found a verdict in favour of the plaintiffs in the above cause, establishing the validity of Blake's Patent, and made a decree for an injunction to restrain the defendants, Messrs. Thomas Archer and Son, of Dunston Engine Works near Gateshead-on-Tyne, from infringing such patent, and ordering them to pay to the plaintiffs the costs of the suit, all persons are hereby cautioned against manufacturing, selling, or using any stone breakers similar to Blake's, which have not been manufactured by the plaintiffs. Application will forthwith be made to the Court of Chancery for injunctions against all persons who may be found infringing Blake's Patent after this notice.—Sole maker in England, H. R. MARSDEN, Soho Foundry, Meadow-lane, Leeds.

NOTICE TO INVENTORS.—OFFICE for PATENTS, 4, Trafalgar-square, Charing Cross. Printed Instructions (gratis) as to the cost of Patents for Great Britain or Foreign Countries. Advice and assistance in disposing of or working Inventions. Capital provided. Branch Offices and Agencies in every Continental State, and in America. Established 20 years. Full information as to Expired or existing Patents at home or Abroad.—Apply personally, or by letter, to Messrs. PRINCE and CO., Patent Office, 4, Trafalgar-square, Charing Cross, W.C.

ROYAL POLYTECHNIC.—MELODIUM "A COUP HARMONIQUE."—Engagement of Signor Calderazzi, for his exquisite performances, daily at quarter to 4 and half-past 7.—Unparalleled Novelties.—"A Spiritual Adventurer"—Everything floating in the Air—New Wonders—Andersen's Beautiful Story, 'The Angel and the Flowers"—Spiritual Manifestations of a Homely nature; daily at quarter to 3 and quarter to 8.—Professor Pepper on Faraday's Optical Experiments: Rose's Photodrome: The Zoetrope—George Buckland's Musical Entertainments. Scenes by O'Connor—The Automatic Leotard—The Abyssinian Expedition—The Shadow Blondin. 1s.

THE BUILDING NEWS.

LONDON, FRIDAY, JULY 10, 1868.

A MINISTER OF ARCHITECTURE, SCIENCE, AND ARTS.

IT has long been felt by many of those who have studied the subject of fine art in its various bearings that, as far as the English Government is concerned, it is in a most unsatisfactory condition. The opinion expressed by Mr. Hope, in the late discussion, upon the absurd statue of Sir Robert Peel, commended itself, we are sure, to many of those who heard it, and will find an echo in the breasts of most of our readers. We want a minister who shall have the general supervision of art and science, and be responsible to Parliament for the way in which he uses his powers. There can be little doubt that it is a perfect absurdity that collections such as that at South Kensington should be isolated and treated as a sort of plaything in the hands of the heads of the Committee of Council upon Education; that the British Museum should be under its separate trustees, and the National Gallery under its separate management. Then, again, there is the Board of Works, with its enormous powers for good or evil, unrepresented in Parliament. One glaring inconvenience was pointed out by Mr. Hope in his letter to the *Times* of June 26, that the First Commissioner of Works and the Vice-President are by general usage both obliged to sit in the House of Commons; so that those in the House of Lords who care for art questions find themselves continually hampered from the constant absence of any member of the Government specially charged with such questions. This, as he observes, is especially annoying and injurious, inasmuch as the Upper House enjoys a learned leisure denied to the other to discuss art questions. Now appears to be the time for ventilating this important question, since it seems at last probable that the whole question, at least of national collections, will be considered and settled. The late debate upon the British Museum estimates shows that all parties are tired of the present state of confusion in which the matchless stores at the Museum are huddled away in corners and dungeons to the certain destruction of much that is capable of being destroyed, and, where that is not possible, hidden from the eyes of the public who have paid for their purchase. Those who want to get up any subject properly will not, we trust, much longer have needlessly to travel from George-street to the British Museum, from there to the National Gallery, and then, if time will allow, off to South Kensington. Before the National Gallery is rebuilt it ought certainly to be settled what it at least is to contain. At the risk of being somewhat tedious upon a subject about which so much has everywhere been said and written, we recur to it because of its immense importance and the manifest wisdom of coming to a decision as soon as possible. We have an unrivalled collection of mediæval art at South Kensington, but it is being so surrounded by other collections that it is difficult to see it, and almost impossible thoroughly to study it. To study it in conjunction with the classic art from which it sprung—the most valuable way of studying it—is of course out of the question. Then, again, there is a supplemental collection of the same sort of works, not nearly so extensive, but quite as important in its way, at the British Museum. It is simply absurd that these two, which together would form an assemblage of objects of mediæval art of double the value they possess separately, should be placed apart, so far apart as to be practically unavailable for the purpose of comparison. Now the facility given for comparing various works of art of the same master or period, and also of one period and country, with those of others, is one of the most valuable, if not the most valuable, result of the forming of great collections. Taste is only perfected by the discrimination and selection of the best work of each period, and this can only be done by comparison. At the same time there are hundreds of ways in which even the very worst work, especially of early times, may be interesting and instructive. What can be done in the matter to gain for our students the greatest advantages? Why clearly, unite those parts of the collections which have a close relation to or identity with each other. But as long as South Kensington is a sort of plaything in the hands of the President and Vice-President of the Science and Art Department, any such largeness of views, such national treatment of the subject, is out of the question. So far from there being anything like unity of purpose between the various bodies who are charged with purchasing for the nation, we have upon many occasions had actual rivalry, and the nation has had to pay threefold for its acquisitions, because the South Kensington authorities were bidding against the trustees of the British Museum or others. This absurdity, we believe, has now stopped, but there is no guarantee that under different heads of departments or by mere inadvertence it may not soon be renewed. If all the art collections were under one president, with a council, responsible to Parliament, such absurdity would be impossible. But it is not only in competition between the rivals that national money is lost; quite as much, if not more, may go in the purchase of duplicates. If we are to have a British Museum mediæval collection, and another at South Kensington, of course neither of the governing bodies will feel obliged to refuse the purchase of a costly work of art because there happens to be a similar example at one or other of the collections; and yet, as far as the nation is concerned, the money would be virtually thrown away. There can, then, for these and many other reasons, be no sort of doubt that amalgamation is necessary, both with a view to economy and efficiency. Here, however, we meet with a logical difficulty, for after all there is really no hard-and-fast line in art any more than in politics, and of course in a national collection all art of all periods and races should as far as possible be represented; and to a certain extent there is a continuity of line which cannot easily be broken without interfering with the historical interest of the subject. If it were possible that a perfect collection of all art could be gathered under one roof, there would be many advantages derivable therefrom, but this is out of the question. There is, however, no insurmountable difficulty in placing our art collection, viewed in its natural aspect as one, under one responsible minister. The classification, arrangement, and housing of the whole would then be more easily settled; for, though, as a mere matter of logic, there is no more reason for separating the modern from the mediæval than the latter from the ancient, yet practically, if division there must be, we can without much objection divide art into ancient and modern—by the latter meaning not that of any particular date, but that which was the production of the Renaissance; so that where mediæval forms and feeling remained to a later date, as not unfrequently occurred, sometimes from exceptional reasons, sometimes the habits of the people, as in the case of the Flemish oak carving, we should include the Gothic work, though later in point of date, in the ancient collection, as bearing a nearer resemblance and closer connection with it. For this reason, on account of the remarkable absence of change in most Eastern countries, and of the immense influence of the East upon the art of the middle ages, we should be inclined to exhibit all or nearly all our specimens of Eastern art—whether original, as in Persia or India, or borrowed in parts of Turkey or Moldavia—in the ancient department. But when the line of demarcation is settled there will still be the great difficulty of settling the location. We can hardly for a moment doubt that the old world stuff should go to the British Museum, where already the bulk of our Roman, Greek, Assyrian, and Egyptian treasures are placed. Of course as long as there is anything like a rivalry between it and South Kensington this will scarcely be done, but should it be found possible to bring about the harmonious arrangement which we are contending for, the matter will be easy enough. It may be wise in certain subjects, such as Glass, where the collection is never likely to be so extensive as to make the question of room a difficulty, not to separate the ancient from the modern, but to show the whole collection in as unbroken a series as is possible. The British Museum will have to give up much, and receive much, to the mutual advantage of both institutions. It will also be called upon to assist in the furnishing of the new National Gallery. Whatever may be decided upon with respect to prints and portraits, it is quite clear that the drawings ought to be shown along with the paintings of the great masters. Nothing more assists one in understanding and appreciating these works than a careful study of the mode of their arriving at the various degrees of perfection they attained. At present not only are the drawings at such a distance from the paintings as to preclude comparison, but they are, from want of room to exhibit them, and attendants to show them, really shut up from the mass of the people. If, as we trust, the exhibition of all that should be exhibited shall be decided upon, no time is to be lost in coming to the decision, for distinct space must be found for them in the new National Gallery. The best conditions for seeing drawings and oil paintings are essentially different. There still remain the portraits to be disposed of. Of these the nation possesses a more divided collection than even of works of art. That all should be collected into one building there is no doubt, but where? Not at George-street, Westminster. Shall they go to the National Gallery, or shall room be found for them in connection with the library at the British Museum? The interest of a large portion being merely historical it would seem, at any rate, to be wiser to keep them, or the greater portion of them, separate from the many artistic collections. If any feasible plan can be devised for showing them well at the Museum we cannot imagine a better home for them. But they might as well be at the top of St. Paul's as over the cases, as the Museum portraits are now placed. From what we have said now upon the art part of the question it is evident what great advantages might arise from putting all these matters under one art minister; and just as good a case can be shown from the architectural and Board of Works side of the question. We are certain that the whole matter is well worth the attention of art lovers. We wish Mr. Hope success in his attempts to move the House of Commons to take his view of the question.

THE ART OF BUILDING IN CONCRETE.—TALL'S APPARATUS.

FOR some time back much attention has been directed to the application of concrete, béton, and its many varieties, to those constructive purposes for which previously brick and stone were regarded as the only suitable materials. We are not now concerned with the employment that has been made of these substitutes upon a scale of magnitude, embracing the construction of sea walls, harbours, jetties, and similar works of corresponding dimensions. Our remarks at present are confined to those examples in which attempts have been made to supersede the use of brick and stone in ordinary dwelling-houses, warehouses, and stores, by the ap-

plication of concrete. The first principle that must be adhered to in all attempts to supersede any recognised and time-honoured system of construction is that the total cost of the proposed novel method must not exceed that of the old. The total cost obviously consists of two items—one, the price of the material, and the other, that of putting it together, the price of the workmanship. This first principle may be expressed mathematically in very simple terms. If Q represent the quantity of material required in one system, the older one for instance, and P the cost of the workmanship attendant upon Q, then P and Q represent the total cost of erection by this method. Let Q^1 equal the quantity of material demanded by the new system and P^1 its cost, then $P^1 \times Q^1$ will manifestly represent the total cost. In order to ensure a fair trial to any new method of construction the maximum value that may be given to $P^1 \times Q^1$ is, $P^1 \times Q^1 = P \times Q$. Unless this fundamental principle be adhered to, there is no practical use in endeavouring to introduce to the public any proposed new method of construction with the slightest chance of making it pay. Either of the two items, P or Q, may be separately greater or less than P^1 or Q^1, but there must be a collective equality in any case. A problem that has been for a long period presented to the architect and builder is, What is the minimum price at which dwellings can be erected for working men and their families? We do not ourselves consider that this is either a fair way of stating the question or a plan likely to solve the difficulty. We do not believe in what is commonly called "cheap work," although we do believe in a cheap principle of work, which is a very different affair. The question, then, resolves itself into the substitution of some material which shall be cheaper than those ordinarily used in all similar instances. Concrete has been employed from very early times in this manner, but its application has been not only hitherto confined to very narrow limits in the building house sphere, but it has never received that amount of investigation and attention which the importance of the subject demands. It has never been regarded in a systematic point of view, and the taking out of a patent by Mr. Tall is the first indication that success will attend its adoption, and render its utility not questionable, but undoubted, its application not transitory and fitful, but steady and permanent.

One of the constant and most shallow arguments urged against concrete walls is that they are not so strong as those built of bricks. It is excusable, although barely so, for amateurs and outsiders to put forward such utter nonsense, but when we witness the same statements supported by professional men, the reply to them becomes a species of absurdity. There are abundance of statistics with respect to experiments conducted with a view to testing the breaking weight of concretes and cements at the disposal of those who choose to search for them. We would advise those who are not acquainted with them to become so before they ignorantly draw comparisons between the two methods of construction. Without entering further into this matter, it will be assumed that a concrete wall built upon Mr. Tall's principle is much stronger than an ordinary brick wall built in mortar. It is not, however, taken for granted that it is any stronger than a brick wall built in Portland cement; they are probably of equal strength, and both after the lapse of a certain time participate more in the nature of solid rock than of an agglomeration of individual and component parts. The actual nature and constituency of Mr. Tall's concrete may be said to be of a double kind, fine and coarse, with many intermediate shades, as it were, depending upon the character of the gravel or stone to be found in the particular locality. The finest description is made from burnt clay, sand, and cement, and the coarsest includes in its composition stones sufficiently large to come under the designation of rubble work. Every professional man is aware that rubble work is one of the strongest descriptions of masonry that can be built. It does not depend for its solidity and inherent strength upon the insistent weight of each stone, similar to dressed ashlar work, but these qualities are imparted to it by the universality of its cementation, the reticulated nature of its union. The stones do not adhere to one another solely by the medium of vertical and horizontal joints, but are cemented together by joints running in every possible direction. Not the least meritorious feature in Mr. Tall's principle is that any kind of stones, the rougher and sharper the better, bats, old bricks, clinkers, glass, and almost any kind of hard refuse, can be safely and profitably utilised. Bulk for bulk, the cost or the value of Q^1 in our fundamental equation is evidently much less than that of Q, supposing it to represent an equivalent amount of brickwork; and since a less quantity of concrete will suffice to give the same strength as a greater quantity of brickwork, the saving in the cost of material is apparent. We now come to the other item P^1 in our calculation. In the first place, we will briefly describe the method of using the apparatus. It consists of a frame composed of uprights at the corners, and longitudinal panels fitting in between, and enclosing a space equal to the thickness of the intended wall. Where there is a long length of wall to be built, it is obvious that the panels, which consist of planks laid longitudinally, would sagg, were they not supported at intervals. This is prevented by the introduction of intermediate uprights, or stiffening pieces, as they might be termed, into which the ends of the panels slide. These stiffening uprights act precisely the same part as the T-iron stiffeners do to the sides of a plate girder. The frame being set up and truly levelled, the space between the panels is filled in with the concrete for a height of 21in. all round. Wood blocks, slightly tapering, are inserted in the material where joists, sills, and other work is to be placed, and the building carried up uniformly. So soon as the 21in. is finished the panels are removed and shifted up to their next position upon the uprights, and so on until about 6ft. in height is gained, when the uprights themselves are shifted up, and so on to the completion of the work. The frame is in separate pieces, and its putting together and taking asunder a very simple operation. We cannot, however, but consider that a large portion of the timber in it might be advantageously replaced by iron. By the skilful and judicious use of angle iron the whole arrangement might be rendered lighter and more permanent. It is easy to perceive that the apparatus is susceptible of improvement, which will doubtless be given to it as it comes to be more generally adopted.

Notwithstanding that one of the items in our calculation is so much smaller than the corresponding one having reference to construction in brick, it is evident that the other is much greater. In a word, it would not pay to employ Mr. Tall's apparatus to build one small house, any more than it would to employ a steam engine to lift one sack of coals, or a locomotive to draw one carriage. The framework may be regarded as plant which may be rendered serviceable for a number of similar jobs, but which is too expensive to be used upon a very insignificant scale. Any person desiring to erect half a dozen cottages or other small dwellings would find the first cost of the concrete apparatus more than repay itself. All concrete work in the walls of houses must be faced with stucco or plaster on the outside, and owing to the roughness of the material the "bite" obtained by the plaster is so good as to virtually incorporate it with the concrete. There would be no danger off it peeling of in patches, as is constantly the case when stucco is applied upon brickwork. On the other hand, there is no absolute necessity for plastering brickwork, provided the bricks are of a quality sufficiently good for facing bricks. All that is really necessary in labourers' dwellings is to strike the joints, and in a house of superior description to tuck-point them. It is alleged as one of the greatest advantages of this system that skilled labour may be dispensed with, and that a common labourer can build up the walls within the frame. This is a point we do not entirely concur in, for care and skill are necessary in building the walls. They cannot be exactly thrown together in heaps, and the materials left to arrange themselves in any manner they choose. Skilled labour may be reduced in amount, but it cannot be altogether dispensed with. We shall be glad to witness the further development of Mr. Tall's principle, as it appears to possess all the elements requisite within the limits we have mentioned to ensure the presence of soundness, solidity strength, and durability in whatever description of building it may be applied to. The manner in which houses are run up with scarcely a whole or sound brick in their entire composition has proved to what ordinary brickwork may come. Any regular systematic method of utilising concrete as a building material, if scientifically carried out, must attract the attention of both professional men and the public.

NATIONAL EXHIBITION OF WORKS OF ART AT LEEDS.

Fourth Notice.

FRENCH PAINTING.

THE art of painting, as a separate school, had no early existence in France, and it is rare to find a French name amongst the artists previous to the sixteenth century. Glass painters and miniaturists she had, it is true, but rarely one of them rose, by his individuality and talent, sufficiently above the level of mediocrity to make a name for himself. Those Frenchmen who did so found a more congenial home in Flanders or in Rome, and may be consequently considered rather as labourers in the vineyard of Italy, or the fat lands of the Low Countries, than as cultivators in France. King René, of Anjou, who loved painting more than power, is almost the only name remembered as an artist; and so barren was the art soil in France that artists were obtained from Flanders or Italy for all the important works in painting which were needed in France during the middle ages. Charlemagne brought from Byzantium, Ravenna, and Rome a large train of artists in mosaic and painting for his works in the north. To the palace of the Popes at Avignon, in later years, came Giotto and Simone Memmi, but they left their record solely on the work they touched, and no local schools were founded by their labours or example. Even as late as the time of Francis I. the painters for his Palace at Fontainebleau had to be brought from Rome, and Andrea del Sarto, Sguazzella, Rosso, Caccianemici, and Primaticcio executed the works there. So great, in fact, was the number of Italians here employed that the prints alone of this school of Fontainebleau, in Marriette's collection, numbered 640. This great influx had some small result, and a few Frenchmen were imbued with a love of art, but, as yet, they found so small a response in France that they chiefly migrated to and stayed in Rome. The earliest illustration exhibited at Leeds of French painting in France is the work of Louis Lenain, or the dwarf—one of a family of artists who lived and died in obscurity at Laon. Of this family four members seem to have existed—one, whose Christian name does not appear to be known; Louis, Antoine, and Matthieu. These latter were three brothers, but in what relationship the other and elder Lenain stood to them is not known. Of Louis we have a fine truthfully painted little picture here, Flemish in character and handling. It is carefully painted, and represents the charitable action

of a peasant girl, who is giving a bowl of milk to a beggar family; it shows a considerable amount of skill, and, what was then still rarer, a very large amount of truth and observation of nature. Louis and Antoine died in their native place, in 1648, within a few days of each other; Matthieu survived them some thirty years, but we have none of his works here. Meanwhile, from Andely, in Normandy, an artist was coming who, more than any Frenchman of his time, left his mark upon the art, changing the character of contemporary painting and impressing his individuality on all who came after him. This was Nicholas Poussin. Educated in the first instance by an artist at Amiens, whose only glory is that he had Poussin for his pupil, he was further instructed in the art by Elle, the Fleming, and, as soon as he could, quitted his native country and settled at Rome, where for forty years he lived, and where he died. To him belongs the honour not only of being the first of his nation who rose to eminence in art, but of reviving in a great measure the decaying school of Italy by turning back its attention to the purer sources springing from the antique, and, above all, of laying the foundation of the modern school of landscape painting. Of both these phases of his labour we have examples here. In "The Massacre of the Innocents" (390) we find a well and classically composed group, worthy of a Greek cameo in drawing but browned in colour, as all his works are, and, by its thinness of painting and lowness of tone, foreshadowing the future characteristics of the French school. A later work from the Liverpool collection (415), called "A Poetic Landscape," is like most of the contributions from that gallery, of very poor character; it combines, in some measure, his two styles, but his power as a landscape painter is better seen in No. 394. Here a grand stretch of the Campagna, backed by the outspurs of the Apennines, and broken here and there by long lines of arcaded aqueducts, leads away the eye into a vast distance. Of course there is the usual cascade in the middle distance and the usual heavy trees in the foreground. A landscape was heterodox in those days unless it had them, and living in Rome he must do as Rome did. Moreover, it was then necessary that a landscape should have a subject, for as a landscape simply it could not be a picture, and the subject here is Hagar and Ishmael. Parched and thirsty, in a shady wood, beside a roaring cascade, they need an angel of large dimensions to lead them to water and to shelter, and they have it: Could anything more be desired? In spite of all this absurdity, which the taste, or the want of it, of the day forced upon the artist, we see here the first glimmering of a study of nature; and in No. 235, where he attempts the grandeur of a thunderstorm, it is even still more manifest, or would be if we could see the picture, which the wretched cross-lighting of the rooms renders impossible, except by an acrobatic performance this hot weather does not render exhilarating. By Gaspar Dughet, the pupil and brother-in-law of Nicholas Poussin, or, as from love to his master and relative he called himself, Gaspar Poussin, we have four examples. Gaspar, except by courtesy, can scarcely be called a Frenchman; born, living, working, and dying in Rome, his only connection with the country which claims him is that his parents were of French extraction, and he really belongs more to Italy than France. His work here is very good, and in No. 207, "Monks Reading," we have a good and careful work, still composed *secundem artem*, but breaking down some of the conventional barriers which hedged about the artist; and in No. 323 we have a yet finer example. Here we see the influence of Claude working upon him, and the fine open reach of low flat land stretching out to the sea, its long horizon broken only by a distant headland and the belvidere of a villa in the mid distance, and its low grey aerial tones, mark it as work of the highest class; but it is to Claude that we owe our further emancipation from those canons of art which had hitherto prevented the expansion of the landscape painter's power. By this Claude Gelle, or as from the district of his birth, he is usually known, Claude Lorraine, we have some very fine examples, showing how much at once of truth and poetry there was in this great painter, whose works it is so much the fashion, since Ruskinism was invented, to decry. One of his finest works here is Lord Dartmouth's "Dancing Dog," which has been engraved by Merriman, and exhibits in a marked degree Claude's knowledge and love of light. Lustrous and morning-like, the far distant hills, the middle distance trees, and the cows in the foreground pool are bathed in light, exhibiting the keen observance of nature and the refined quality of mind so pre-eminently observable in this painter's works. Another picture, from Lord Scarsdale's collection (No. 388), exhibits some tree drawing of a character so true and natural that Turner himself might have gloried in it. Lord Faversham's two examples (Nos. 2,929-2,930), in the Dudley Gallery, are very bright and fine, but injured by overcleaning; yet sufficient exists to show what Claude was, and to those who derive their knowledge of this old master from books alone and echo the pretty sentences of Ruskin we commend the study of these pictures here, when they will find that Claude Lorraine was the more truthful of the two and quite as pretty.

Sebastian Bourdon, the friend of Claude, is represented by two examples, showing well-directed study and great power in drawing, but at the same time most painfully exhibiting his inability to colour. In the first of these (No. 366) "A Repose," from Lord Faversham's collection, we have a composition of thoroughly Italian character, and exhibiting in the landscape portion the influence of his friend. The other of his works here is a nobly composed and ably drawn picture representing the lifting up the Brazen Serpent in the wilderness, contributed by Lord Chesham. The groups which surround the life-giving symbol are admirable in their pose, and the central one, of a young husband who has brought his loved wife, but just too late, to raise her eyes to the healing type, is most touchingly conceived and pathetically rendered, but the colouring is weak and flat, and as Bourdon's etchings show in light and shade, form and grouping, he was a master, yet in colour he always remained a tyro.

Attributed to that manufacturer of pictorial battles, Charles Le Brun, are four pictures, three of them being his stock subjects, the Triumph of Alexander, translated into French of the time of Louis Quatorze, and the fourth, a better painting, the meeting of Elizabeth and the Blessed Virgin—a subject, however, which required a man of feeling rather than a man of fashion, to translate. Le Brun had clever hands only—no heart, and failure is the consequence. We have another battle painter here of a different stamp, one who gave us the bold dash and vigour of the combat, and told his tale more like a soldier than a courtier. This is Jaques Courtoise, as the French call him—Jacops Cortese, as he called himself, but who is generally known by the name of Il Borgonone, having been born in Franche Contè. He had practical knowledge of both painting and fighting, and studied both of them in Italy, where he died a Jesuit father, in 1676. His fine confusion and bold colouring in No. 367, where the large masses of men and horse unite in deadly strife, are admirably depicted, and the more open skirmishing party in No. 384 is an exquisite bit of warfare, but there is not the slightest *soupcon* of French character in it all, and he really belongs to the Italian school.

This brings us to the time when French art impinged upon England, and when the Edict of Nantes, and the troubles which followed upon it, drove many Frenchmen, and amongst them some few artists, to England. Rosseau was one of these, and we have here by him an illustration of a class of painting now long passed away. We mean the architectural scenes which it was the fashion in the beginning of the last century to inlay into the walls of the staircases and larger rooms of the good old mansions they built then-a-days, and such as he painted for Montague House, the nucleus of the British Museum. The subject is a triumphal arch, with Corinthian column seen in very quick perspective, admirably drawn, but slightly insipid. By his fellow countryman and fellow labourer at Montague House—Cheron—we have two small examples of no great merit. The former of these (No. 404), "Boaz and Ruth," from the Duke of Devonshire's gallery, is the better of the two, and being in monochrome does not exhibit this artist's inability to colour as does his "Walk to Emmaus" (No. 416). Largillere, who also was much in England, is made known to us through his intelligent portrait of that "gardener of Kings," Le Nôtre, to whose skill and taste we owe those long lines of avenues which, "fine by degrees and beautifully less," lead away the eye into such distances at Versailles. From Le Nôtre's portrait our next step is to the works of that painter who peoples his glades and gardens—Watteau.

By, or attributed to Watteau, are no less than eight pictures exhibited here, a few of them perhaps genuine, but some most palpable copies, and some wrongly named, and even the genuine ones by him are, as a rule, but of second-rate quality. There are few men whose fame has suffered more by their success than Watteau. Fitting, as he did, so exactly the public caprice, reflecting so strongly by his painting the literature of his time, and writing in an universal language the pastoral prettinesses of the Strephons and Daphnes, the Colins and Chloes of his day, the demand for his works was so very great and so widely spread that whole manufactories of what may by courtesy be called decorative paintings were created to supply it. To the whole of the enormous mass of rubbish thus provided was the name of Watteau affixed, and though some few men arose who could give sufficient individuality to their works to make an independent name for themselves, yet even their works are very frequently given to this the greatest of the *petites maitres* of his day, and are duly catalogued as his. Nos. 374 and 388, belonging to Earl Catheart and Mr. Heywood Hawkins, are evidently companion pictures, now once again united under the same roof. Both represent those *fêtes galantes* Watteau created on canvas, and which were endeavoured to be carried into actual life in the rather queer times of Louis XV. and the early part of Louis XVI., when shepherds and shepherdesses were in high vogue in the quartier St. Germain, and who mistook the young wolves of the quartier St. Antoine for silly sheep. These two pictures are clearly and cleverly painted, with a light touch and a light heart, and, like a soap bubble, are brilliant albeit they are hollow; yet they are hardly good enough to be Watteau's, but are clever imitations. To our mind the only original specimen of this charming master here is Mr. Vaughan's "Fête Champêtre," a study for the picture now in the Louvre. It is remarkably clear and silvery in tone, and the soft delicious landscape shows what Watteau was capable of. In England this master is really unknown. The large amount of copies quite prevent his true genius being appreciated. We have seen him combine the two qualities of Claude and Rubens, but of his larger and more vigorous work we have no examples. Two out of a set of four seasons are here ascribed to him, but are by Lancret, and will be found amongst his engraved works. Lancret was Watteau's greatest imitator, and the one who rose to the greatest eminence; and besides these two, we have here, in his own name, a pleasant little game at Blindman's Buff (No. 403), worthy of study for colour and clearness. His coadjutor in decorative

work, Boucher, is but poorly represented, even in name, for there are but two works attributed to, and none by him, here.

Of Vernet, the father of the celebrated Carl and the grandfather of the still more celebrated Horace, we have several very fine truthful landscapes here—landscapes which show that the old days of composing by rule had passed away and that nature was now beginning to be studied for her own sake. The careful hazy morning scene upon the beach (No. 372), where the fishermen return home from their nightly toil upon the deep and where the sea fog shrouds each object with its mysterious halo, is painted in a manner Turner could not surpass. In No. 407 we find him in another mood, when the spirit of Claude was upon him and the soft sunset glow lights up the seaport with a calm serenity, offering a powerful contrast to his "Storm" (No. 388). This latter is a marvellous bit of painting; land, water, and sky all truthfully observed and well expressed, whilst his figures and accessories are most exquisitely rendered. Of his earlier work we have a fine foreground bit of Tivoli, where he still felt the influence of Salvator Rosa, but in which we see his own fine quality of light. Of Greuze, the connecting link between the past and the present, and who died in 1805, we have five or six pictures which bear his name, but in some of them we find, instead of his work, the most audacious and mendacious copies. The most unblushing of these is No. 387, for which, we believe, a long price was paid not long ago, and which is worth almost the cost of its frame. It is a morbid, bruised female head, presenting none of the rich qualities of this fascinating painter. Mr. Cholmondeley's charming specimen in the Dudley Gallery (No. 2,928) shows what his touch and treatment really were, and there is a very pleasing little bit lent by Mr. Knowles, but which is not yet included in the catalogue, and this closes the range of the "old masters" in galleries A and B and the centre or Dudley Gallery. In gallery C is a good collection of the German school, which we must reserve for our next notice.

AN INDUSTRIAL MUSEUM AND FREE LIBRARY FOR LONDON.

A SOCIETY named the Public Museums and Free Libraries Association, established for the promotion, the improvement, and the popularisation of scientific, artistic, and literary collections, and whose proposals were warmly commended to the encouragement and help of our readers several months since, has set itself to the task of obtaining, if practicable, better accommodation for the museum and library of the Patent Office. In this special work the council of the association are sustained by a number of eminent men. To large numbers of practical minds the promotion of museums and libraries generally may appear to be of far inferior moment to the fitting development of institutions which if they were properly cared for would place within reach of the skilled artisans and mechanics of the metropolis the means of gaining that knowledge the possession of which is so marked a feature in the training and qualifications of their continental competitors. The Museum of Patents, at South Kensington, has hitherto been regarded very much as a collection of mechanical curiosities. Placed at a distance from the dwellings of the hard-handed, clear-headed foremen and workmen in the engineering and chemical establishments, it is not to be expected that it could exercise any perceptible influence in diffusing a knowledge of the progress of science in its industrial applications amongst the classes from whose intelligence and ingenuity we get so many of our most practical inventions and improvements. Yet the purpose of the museum was declared nine years ago to be that of an historical and educational institution. Exact models of machinery in subjects and series of subjects, showing the progressive steps of improvement in the machines for each branch of manufacture, were, it was stated, to be exhibited. For example, it was intended to show in series of exact models each important invention and improvement in steam propellers from the first engine that drove a boat of two tons burthen to the gigantic machinery of the present day propelling the first-rate ship of war or commerce. The original small experimental engine that drove the boat of two tons was already in the museum. It was further averred officially on the part of the Commissioners of Patents that a large number of valuable models remained in their cases, for the reason that room could not be found for exhibition; the Commissioners have been also, and for the same reason, compelled to postpone the acceptance of many valuable models offered as gifts by manufacturers and inventors, and visitors to the iron shed, which reminds us, by the contrast it presents to the palatial structure near by, that art, the plaything of the affluent, is cultivated to the neglect of science and industry, the mainstay of our country's prosperity.

The Scientific Library of the Patent Office was reported upon together with the museum in very strong language by a parliamentary select committee in 1864. For purposes of reference or research there resort to Southampton buildings about 16,000 readers annually. The use that might be made of this library if greater space were allotted to it and it were opened after the ordinary daily labour of the wage-paid class ceased, may be inferred from the number of references to the publications of the Patent Office alone in the central library of the city of Manchester, where, in a single year, the total reached 38,000. In July, 1864, when the Commons' Select Committee reported, matters in the library were, perhaps, at their worst. The House was informed that the place used for the inspection of specifications and drawings was little better than a dark passage, in which there was barely standing room. The library was found to be of great value and utility, but its utility was seriously impaired by its crowded state and the want of sufficient attendants; the books were stowed away in a number of small rooms, or rather closets, some on floors, some on tables, some in passages, and some on shelves; while the store rooms were so overloaded that the floors had already sunk, and the surveyor of the Board of Works refused to allow them to be loaded any more, lest they should break down. At length, at a cost of £15,000, new rooms were built in the upper portion of the building, which the Patent Office was allowed to use for the purposes set forth in the Act of 1852, and these were opened in April, 1867. But they were far too small for the purpose; barely sufficient for the accommodation of the books which were in the library at the time the rooms were erected, they contained no provision for future expansion, and they are already completely filled, while there is no space in which new shelves can be placed for the additions which the library continually receives.

Several questions should be very plainly put to the Government. Why, we would ask, are the appeals for a building in a central locality, which the Commissioners have made, and repeated ten years successively, still ignored? Why has the Treasury received, in addition to the stamp duties which the Act of 1852 allows, £511,000, the surplus revenues of the Patent Office since 1852, while the museum and library, which the Commissioners were, by the act, expressly authorised to establish, remain a bye-word and a scandal to the metropolis? Why were the museum and the library ever placed at a distance of three miles one from the other, as though the utility of institutions depended on their being separated when of a kindred character, and likely to be popularly resorted to the more inconvenient of access? These questions embrace the points to which the Public Museums Association now ask the attention of the public. We trust that, supported by the voice of the people, and through such men of mark and authority as Mr. Austen Layard, Professor Leone Levi, Lord Ebury, Sir Robert Collier, and others, the aims of the Association will not be long in accomplishment, in obtaining, by the union of the Patent Office, museum, and library under one roof, a polytechnic institute worthy of comparison with the twenty-one states and colonies, which are in this respect at present our superiors.

LINCOLN CATHEDRAL.*

THE architectural history of Lincoln Cathedral has been already very ably and completely described by two most competent persons—namely, Professor Willis and the Rev. G. Ayliffe Poole. I am not aware that Professor Willis's remarks, delivered at the meeting of the Royal Archæological Institute at Lincoln, in 1848, have ever been published or made available in any form to the members of this society. Mr. Poole's were printed, together with a valuable appendix, comprising all the historical data bearing on the cathedral and connected with the see, in the volume of this society's Transactions for 1857. Mr. Poole's review of the building was based chiefly upon information derived from the light which this collection of historical facts threw upon the subject. It is, in every respect, a very interesting treatise. When, then, the committee of this society did me the honour to invite me to lecture to you here to-day, I had to consider from what new point of view the subject might be again presented in an acceptable form to the members of this society. I believe I am correct in assuming that at meetings of this kind the greater part of those present may be more correctly described as taking a general interest in the study of church architecture than as possessing a critical knowledge of the subject. It appears to me, then, that I shall best serve the purpose of the committee and the objects of this society, which no doubt are continually to enlarge the circle of those who interest themselves in the noble series of monuments that contain the history of our national architecture, by endeavouring to draw from the building before us a few practical hints on the subject of church architecture generally, and by pointing out the excellent illustrations which different parts of the structure offer of the several periods of this interesting history. And in doing this I intend, craving the indulgence of the more learned members of the society, to address myself more particularly to those whose knowledge of the subject is less advanced, and who consequently stand in greater need of help and guidance in their studies. Now, in order to render what I say useful or even intelligible to this portion of my audience, it is necessary that I should explain the few technical terms which I intend to use; and here I may remark, by way of parenthesis, that the fewer technical terms a lecturer uses to a mixed audience the better, and the more obvious and self-explanatory those terms are, the better.

It is just twenty years ago—at the meeting, in fact, of the Royal Archæological Institute at Lincoln, in July, 1848—that I read in this room a paper, a copy of which lies on the table, on certain parts of Lincoln Cathedral. This paper formed the basis of a work which I subsequently published, and in which I proposed what was then a new division and nomenclature of the styles of English architecture. As this terminology is the one which I intend to use to-day in the classification of the different works of Lincoln Cathedral, it is necessary that I should briefly explain it. There is one division of the architecture of Europe on which all are agreed—that, namely, which separates the buildings of the Middle Ages into two classes; the first comprising all those buildings that were erected during the prevalence of the circular arch, and the second those that were constructed during the prevalence of the pointed arch. These two classes have been, by common consent, called Romanesque and Gothic. Of English Romanesque buildings we have again two kinds, those

* Lecture delivered to the Members of the Lincolnshire Diocesan Architectural Society at their Annual Meeting at Lincoln, on Wednesday, June 17, 1868. By EDMUND SHARPE, Esq., F.R.I.B.A.

which were erected before and after the Conquest, and which may, therefore, be conveniently called Saxon and Norman. Of the buildings constructed during the Gothic period, the most natural division is that which is indicated by the several changes of form through which that prominent feature of every mediæval building, the window, passed during that time. These changes of form are exhibited in the four diagrams on my left. In the first half century after the complete adoption, in all parts of buildings, of the pointed arch, the lancet window was alone used; during the next half century, or thereabouts, the geometrical window, or that in the tracery of which that simplest of all geometrical figures, the circle, prevailed, was alone used. During the next half century, the window-heads were characterised by that peculiarly English feature, flowing tracery, in which the ogee, or curve of contra-flexure, was conspicuous. And during the last or fourth period of Gothic art, straight lines, both horizontal and vertical, formed the leading lines of the tracery of windows. I proposed, then, in the work to which I have alluded, to call these four periods of Gothic art respectively, Lancet, Geometrical, Curvilinear, and Rectilinear, terms which may be accepted as fulfilling the condition already laid down, and as being sufficiently self-explanatory. But there remains to be noticed a period during which many buildings were erected, of great importance and great originality, to the characteristic features of which sufficient attention has not even yet perhaps been sufficiently directed—I mean those that were erected during that prolonged struggle which was carried on between those two rival principles, the circular and the pointed forms of arch; in fact, during the interval that occurred between the first appearance of the pointed arch and the final disappearance of the circular arch. To this interval I gave the name of the Transitional Period, a term that has become now almost universally adopted as applied to these buildings.

We have thus seven periods of the history of church architecture in Great Britain, to the duration of which I assigned twenty years ago the following limits, which subsequent experience and study have not in the meantime led me in any respect to alter:—

	A.D.	A.D.
Saxon Period ...	—	1066
Norman Period ...	1066	1145
Transitional Period	1145	1190
Lancet Period ...	1190	1245
Geometrical Period	1245	1315
Curvilinear Period	1315	1360
Rectilinear Period	1360	1500

I have now only three other technical terms to define in order to enable me at once to enter, without further explanation, upon the examination of Lincoln Cathedral.

Almost all the great cathedral and conventual churches of this country are divisible in their entire length into three parts, forming the three branches of the Latin cross, namely, choir, transepts, and nave. They are also generally divisible laterally into three portions, namely, choir, or nave, and north and south aisles. Vertically also this tripartite division is again found; the entire elevation of the main interior walls being usually divided into three portions or storeys, separated and defined by horizontal string-courses. These three storeys I have named the Ground-storey; the Blind-storey, from its being usually dark, and opening into the roof of the side aisle; and the Clere-story—terms which also sufficiently explain themselves.

Now it will strike everyone that looks down the nave of a mediæval building that it consists of a number of exactly similar compartments, placed side by side, and tied together by three horizontal lines or stringcourses, which separate these three storeys; the same remark applies as well to the outside of these buildings. For the purpose, then, of comparing the architecture of one structure with that of another, with a view to trace the progress of the art of building through the middle ages, it will be sufficient if we take one or two of these compartments, and place such a representation of what may be called the *main idea* of a building side by side with two similar compartments of another, or of several other buildings. This is what I have done in the six large diagrams on the wall behind me, which represent each two interior and exterior compartments of six of the cathedral churches of this country, constructed during each of the six periods of British architecture from the Conquest to the Reformation. Of the seventh or Saxon period, the remains are so few and so incomplete that we have not the means of exhibiting an entire compartment of any building of that period. Of these illustrations I may observe that two, those, namely, of the Lancet and Geometrical periods, are taken from Lincoln Cathedral; and finer or more characteristic examples it is impossible to select.

Now, time will not permit me to lay before you in detail the characteristic features which distinguish these six periods of Christian architecture from one another. They are, however, sufficiently obvious to all who have paid any attention to the subject, or who will take the trouble to examine and compare these diagrams with one another; and to those who may be disposed to enter on this comparison, I would suggest that they should also examine and compare with one another the enlarged drawings of the different details of these several compartments, such as capitals, piers, and carved work, which are placed beneath these diagrams. And now let us proceed to consider how Lincoln Cathedral, one of the grandest of our national monuments, serves to throw light on the history of church architecture; to which of these several periods its different parts belong; and how far we may be able, by its works, to trace the progress of Christian art in this country during the middle ages. Professor Willis was the first to apply colour to the ground plans of churches, for the purpose of indicating the different periods of their construction. He applied his colours indiscriminately, and simply with a view to distinguish one part of a building from another. It appeared to me some time ago that this use of colour might be carried a point further, and, in fact, made much more useful, by attaching a fixed signification to the employment of different colours—by causing, in fact, a specific colour always to represent a specific period of architecture; and it occurred to me that no better basis could be taken for such an application of colour than the prismatic spectrum itself, which, in a twofold sense, is peculiarly adapted to represent and typify the gradual progress of art in the buildings of the middle ages; first, because, as in church architecture, that progress was so regular and so gradual as to be almost imperceptible, and to render it difficult for us to draw any exact line of demarcation between the buildings of one style and those of another, or to enable us to say, for example, where Norman art ends, and where English art begins; so, in the prismatic spectrum, it is difficult to say where one colour ends and where another begins. Yet inasmuch as we are obliged, for descriptive purposes, to call certain portions of this blended whole blue, green, yellow, and red, so are we, for the same reason, under the necessity of selecting and characterising, in the same manner, certain portions of the history of this continuous art, and of designating these parts by some such specific terms as those above proposed. And, in the second place, this adaptation of the prismatic spectrum to our wants in this respect, appears to me to be a peculiarly happy one, inasmuch as our national architecture, rising out of the deep gloom of debased Pagan art in the dark age of barbarous invasion, is thus fitly represented as brightening gradually into the glory and refulgence of Christian art in the Geometrical period of the thirteenth century, and as deepening again in its descent through the three following centuries into the dark age of Pagan revival in the seventeenth.

I have, therefore, already for some time, for my own purposes, made use of the following selection of colours to indicate on the ground plans of churches the particular dates of the construction of their different parts, and I think I can safely recommend it as a convenient one for general use:—

	A.D.	A.D.	
Norman ...	1066	1145	Black
Transitional ...	1145	1190	Blue
Lancet	1190	1245	Green
Geometrical ...	1245	1315	Yellow
Curvilinear ...	1315	1360	Orange
Rectilinear ...	1360	1500	Crimson

The ground plan of Lincoln Cathedral behind me and the elevation of its grand west front above it are coloured after this fashion, and you will see at once that every one of the six periods of English architecture are more or less represented in both.*

* To be continued.

ON FASHION IN ARCHITECTURE.*

"FASHION," says a pungent critic of the last generation, "is gentility running away from vulgarity, and afraid of being overtaken by it. It is a sign the two things are not very far asunder." This caustic observation of Hazlitt needs but the alteration of a word—the substitution of "affectation" for "gentility"—to apply with almost as much truth to fashion in art as in its original form it does to fashion popularly understood, as meaning the outward forms and garb of the upper ranks of society. Fashion in both cases is a capricious adoption of peculiarities dictated by no real necessity, and dependent generally on no natural cause or principle; and in both, while it may sometimes tend to what is suitable and graceful, it is in constant danger of leading its votaries to the extravagant and ridiculous. That in art, which is, or should be, the full display of the application of the principles of nature—the characteristics impressed on the visible creation by its Maker—to the purposes of human life and of the higher forms of human pleasure,—that in art such a system as can be called "a fashion" should ever be found intruding seems a strange anomaly, but that once invading such ground it should be found fastening most frequently on architecture is perhaps less strange. Architecture in its more familiar forms and objects is brought nearer to the bounds of the common-place needs and habits of civilised humanity than the other arts; and since it is certainly that of all the arts which is most constantly visible and prominent, the more reason seems to me to exist for guarding it jealously from what will lower its value and diminish its refining influence.

Fashion has often exhibited strange freaks in other fields than that of fine art, and the hold which, when once established, it has in some of these secured affords a ground of warning to all concerned with art against admitting within its charmed region an influence so destructive of what is real and true.

Some sixty or more years ago the forms of English printing type were by great study and labour, chiefly of a single individual, brought to the perfection—for such it may be called—of proportion, balance, and connection which we see exemplified in the best specimens of modern typography, and eminently in the various editions of the Bible and Book of Common Prayer, issuing from the University and other presses; and it needs but a glance at such, as compared with the forms of type in use during the two previous centuries, to see that, in respect of grace of form, ease of reading, and all other requirements of good printing, its superiority is immense.

Some years ago, in the publication of an elegant biographical fiction, the idea was adopted of producing it in a form of type similar to that in use at the time to which it referred, and this pretty conceit added popularity to what in itself took worthy rank among the most graceful contributions to the lighter literature of our day. The type had been cast and used, but not destroyed, and soon we found book after book published, many without the least relation to any special period, but all appearing in the obsolete garb which well fitted the work it first belonged to, but was senseless and worse as a matter of general application; for it led to a very common loss of the distinction in point of excellence between the old and later types, insomuch that I have heard some affirm that they considered the latter the worse and the old the better—an error which their eyes would not fail to convince them of should they prolong habits of reading into advanced life.

What has thus happened in printing may befal, nay, has befallen, art, and we have all witnessed the elevation into popular favour, as fleeting as it is groundless, of a school of painting which decried beauty and ignored all that had during centuries been attained in grace of composition, force of effect, or harmony of colour. The true and the beautiful will indeed again and again, through all time, re-assert their rightful supremacy and reign through periods which the brief terms of all caprices combined cannot equal; but each of us lives but one life in this world, and it is painful, through the folly and affectation of our contemporaries, to be deprived of a part of those graces of life which the really consistent and faithful labours of the artist never fail to furnish to his fellow men. Fashions in architecture are not a novelty; they have arisen again and again in this

* Read before the Liverpool Architectural and Archæological Society, by H. P. HORNER, architect.

and other countries, but are distinct from styles as fiction is from fact. Styles, be it remembered, grow out of use and experience; fashions spring up almost in a day, and are often but crude revivals by inexperienced hands. Styles rest on the principles of art and keep within its limits; fashions recognise no real principles, and, though they may contain them, it is not from preference but because of their prior existence in what fashion has seized. Styles are consistent in themselves; fashions revel in inconsistency; and thus might be multiplied distinctions between the two as wide as can be in what relates to the same art.

Deficient knowledge of style has much to do with fashion, and the latter very often consists in the misapplication of what are the essential characteristics of the former. Thus, in the first quarter of this century, very few were acquainted with what constituted the reality of the then recently explored style of Classic Greece, but the fashion prevailed of applying its features to all conceivable structures, caricaturing what was supposed to be imitated, and bringing into contempt what was most worthy of regard and admiration. Genoa exemplifies another phase of fashion; for there the graceful compositions derivable from combinations such as Palladio excelled in are travestied in painted façades, where all that constitutes architecture, save the flat outline, is wanting, and real buildings are dealt with like the surfaces of mere theatrical backgrounds.

When notice was first strongly recalled, after a lapse of centuries, to our native pointed styles, a fashion arose, too, of patching details like theirs on every kind of building and thus "Gothicked," as I have heard it gravely called, they were supposed to present examples of our native architecture; and I need scarcely say through how arduous a course of persevering study and illustration it was that we arrived at what brought us out of fashion into style in the use of our own national architecture. A senseless fashion of long, long standing, involving with our own another art in its folly, is that of exalting portrait statues on columns which, in their form and features, become utterly unmeaning unless supporting a spreading mass of architrave or archivolt, while for all purposes of portraiture a dummy model, varied in costume as desired, would equally well serve as any statue on which pains and thought have been lavished, to be lost, until the column falls away in decay, to all inspection except through a telescope. Begun after the decline of art and under the influence of imperial vanity in Rome, this ridiculous arrangement has been repeated generation after generation, and, in spite of protests by all good critics in architecture and sculpture, continues in adoption under the dictum, sufficient, doubtless, to the mere pedants in arts, though, unhappily, also adopted by some who ought to know better—"the ancients did it."

All that is the fruit of mere fashion in design must become obsolete so soon as the fashion itself is exhausted; and this I say, the last quoted example notwithstanding, while all that is designed on the true principles of art will endure under the lapse of time, because appealing to the apprehensions of cultivated intellect under all varieties of human society and institutions. Vulgar opinion alone is met and satisfied by what depends on fashion; and though, unhappily, its folly, as in the statue columns, becomes stereotpyed for posterity the better judgment derived from the study of art in its origin and principles survives to condemn it, and let us hope, even in so hard held a position as this, at length to expose and explode it.

It is true that in architecture, as in the other arts, some things may become fashionable, and merely fashionable (I mean chosen independently of art principles), and yet no harm be done, since non-essentials in art exist, as in theology, and modes of treatment and peculiarities of detail may become almost universal in adoption which involve no principle, and so are matters of indifference; but, at once, on the step being taken where a principle is sacrificed for a fancy, damage to art arises, and may be unhappily perpetuated. On the other hand, fashion may even, but alas! does rarely, assist art by recognising for favouritism some true principle of design; but even then the advantage is fleeting, since, with the next turn of the glass, the opposite may come into favour and all be reversed.

The parts of architectural works, however, which, by fixing themselves on the popular mind, become in fact fashionable, are chiefly those which exhibit peculiarity of detail rather than markedness of principle: and, as all fashionable peculiarities have a tendency to run into exaggeration, principles of form and chiaroscuro, though not directly touched by these caprices, become at length obscured and drowned under the prominence given to the very details which ought only to serve as accessories and supporters of the effects of these higher points of architectural excellence.

Fashion in architecture, as in other things, to a great extent dies out from time to time, and gives way to other "new things" (as they are supposed to be, though often but revivals of the obsolete), but unfortunately such fashion cannot, like that in clothing, be put away in the waste closet, but stands for generations, it may be, in sad evidence of the vapid caprices of its era.

When the Gothic revival in England, having passed its first period of mere patched-on detail, which I previously alluded to, led to the style being treated *systematically*, and especially as an ecclesiastical one, and that fastening so on the popular mind as to become a fashion, and in so far certainly not an unwholesome one, the acute gable was often carried to a pitch which it rarely attained to in ancient practice, and some devotees of the style, both critics and architects, asserted warmly that anything less than an equilateral pitch was out of the question if the true effect of the style as exemplified in old examples were to be obtained.

By collating old examples, however, it will be found that about 70 deg. rather than 60 deg. is the usual angle, the latter very seldom indeed occurring, and appearing always too sharp when adopted in any but very small gables.

This acute gable system, however, was pursued for a considerable time by several architects of extensive church practice, and marks their buildings, many of them very good in other respects, with a kind of caricature effect of Gothic, and quite wide of that belonging to the ancient ecclesiastical buildings which their authors were so desirous to emulate.

In like manner the fancy for bands of colour, plain or chequered, has been carried to an absurd excess in still later architectural practice; for, whereas in old works of a good class such bands were adopted generally only to break a large surface of monotonous walling, and often marked simply the introduction of a material used in binding courses of greater cost and rarity than that of the common walling, we see them now multiplied in such a way as absolutely to obscure and obliterate all ordinary effects of light and shade obtained from the use of projecting details.

A fashion akin to this, and it was no better than a fashion, and in great part the parent of the modern one, existed in interior church work in Italy in late Romanesque works, but I have heard no opinion from any architect of cultivated taste and independence of thought than that the harsh contrasts of light and dark bands destroyed the effect of the essential forms of the design, and broke up the general effect into stripes most unpleasing to the eye and mind.

The common tendency of fashion is not towards the adoption of what is remarkable for excellence, but for obtrusiveness and even eccentricity; and all such peculiarities made permanent in architecture constitute an almost unmixed evil.

The impressive effect of massiveness has led to its being absolutely caricatured in some late ecclesiastical works, and when leading men in our profession set such an example, it is only too readily followed and exaggerated by those of less note or standing.

"A little stronger than strong enough" was an excellent constructive maxim of our great engineer Smeaton, but beyond this he never carried it, even at Eddystone; while on the other hand, in some recently built towers, and even village churches, arches, piers, and buttresses may be seen, yea, and with many admirers, which simply make the buildings look ridiculous, like dwarfs indeed in giants' clothing.

What good reason, in regard to construction or effect, can be given for covering a window slit of 15in. or 18in. wide with an arch highly pointed of some two and a half or three bricks' length in depth, or for carrying an aisle arch reaching nearly to the wall plate on a pier which would well support ten times the weight? Yet such and other such are the characteristics of the style I allude to.

There is no architectural style which has ever gained a footing at all permanent among intelligent and really cultivated nations which will not be found to possess qualities of design well worthy of preservation and adoption in principle, if not in detail, and yet none of these styles are free from freaks and caprices of design, which, often attracting the vulgar eye much more than those higher qualities just referred to, will mar any design in which they may be repeated, while, unhappily, tempting a certain class of designers to such imitation by the fact of their serving to feed that popular appetite for mere novelty or peculiarity to which such artists (save the mark!) must purvey, or lose their one only line of so-called successful practice.

I have said that the styles of intelligent and really cultivated nations all afford points worthy of adoption in principle at least, and I purposely make the distinction between real and unreal cultivation, since semi-barbarous and spurious forms of art in architecture have often prevailed under the growth of nations in wealth and power when in these last respects they have advanced with more rapidity than marked their steps in the path of science and refinement.

Mexico, India, China, all present to our knowledge different phases of such half-civilised architectural art, and it can be little better than folly to argue, as some have done, and strenuously, that these styles can be worth the serious study for example or adoption of the modern architect in any civilised country, however interesting they may be and doubtless are to the ethnologist, the antiquary, and the archæologist. Constructive cleverness and massive boldness may be found even in the styles of such countries as I have just named, but the same will be found in shapes much better adapted to our purposes and much more worthy of attention in other styles of really civilised nations than in those where they are marred by association with forms and ornaments at once senseless and ungraceful.*

PRIZES OF THE PLASTERERS' COMPANY.

IT is not very generally known that the Plasterers' Company of the City of London offer annually £25 in prizes to advance the art of their company. The following are the results of the competition, as decided by the Science and Art Department, South Kensington, for the past year, 1867-8. The names of the prize-holders are placed against the respective objects competed for. There were two prizes for a model in plaster suitable for the ornamentation of a frieze; an original composition in the Italian Renaissance style, size 24in. long by 12in. wide, to be designed and modelled by the competitor, or the designer and modeller might combine and divide the prize:—School of South Kensington, for the best, £8 8s, A. Gibbons; School of St. Martin's, second best, £5 5s., George Jupp.

There were also two prizes for an original design for a centre ornament for a ceiling, in any style capable of being produced in plaster; the design was to be shaded in relief, either in chalk, or monochrome, and was to be drawn to scale, together with a portion of detail of full size, on an imperial sheet:—School of South Kensington, for the best, £7 7s., Mackaness; School of Exeter, second best, £4, M'Pinn.

These prizes were open to all students in the Provincial or Metropolitan Schools of Art, including artisan classes in those schools; but the first and second prizes in either case could not both be taken by students of the central school at South Kensington. All works sent in competition for these prizes were specially prepared and named as being in competition for the prizes of the Plasterers' Company of London. No student was to send in more than one design for each subject. There were fifteen portions of friezes sent in, and twenty-two designs for the centre ornament for a ceiling. These will shortly be exhibited at South Kensington, together with the other works of art sent up from the provincial and metropolitan schools.

We are happy to see that a suggestion long since offered in these columns is about to be carried into effect, and that the vegetation of Trafalgar-square is to be no longer confined to the struggling lichens of the Nelson podium. One row of stately plants in tubs has been placed in front of the northern retaining wall, and we limit our notice to a welcome of the beginning thus made. The botanical improvement of public places is certainly a noticeable feature of modern administration.

* To be concluded in our next number.

LABOURERS' DWELLINGS.

AT the present time a great deal is being said about the erection of new Law Courts, which may now be said to be finally settled; a new National Gallery, an illustration of which we shall give next week; new offices for the departments, which will absorb millions sterling; new buildings at South Kensington, a site which almost everyone has condemned, and many other public improvements; but little is said about a far more important question than either—namely, dwellings for our working population. It is, therefore, most refreshing to meet with a sentence like the following, which was uttered by the President of the Liverpool Architectural Association, in his closing address a few days since. He said, "It must be admitted that on one very important point, which till of late years has been much overlooked by architects and men of science, by philosophers and philanthropists, by legislators and by statesmen, but which tends more to promote the health, longevity, morality, and happiness of the majority of the human race than the erection of the most splendid and extensive museums of art and science, or the most magnificent cathedrals—I mean the erection of healthy, well-ventilated, comfortable, economically constructed dwellings for artisans and the labouring classes." No doubt many a man in the plenitude of his egotism will sneer at this statement. "What," he will say, "the moral condition of our working classes of more importance than our public buildings or our cathedrals—pooh-pooh, let the working-classes take care of themselves." But what if the same class should turn round and say, "You gentlemen have hitherto had matters pretty much your own way. You pass laws for the demolition of hundreds of tenements at Temple Bar, and dispossess many hundreds of families, and you send them you know not whither. You also determine by Parliamentary action that new Law Courts should be erected on the site, so that our judges may have more elbow room to administer the law, and you vote certain public funds for the purpose; but you appear to take small heed of the people. We, therefore, must imitate your example and have laws passed which shall tend to the securing of better house accommodation for the people. If you insist by Parliamentary power to pull down, we must also insist by the same power to build up." No one can deny that there would be some logical force in this argument. There are none so blind as those who won't see; and we look with apprehension on the manner in which members of Parliament and artists speak about our public buildings and public statues, and the comparative indifference with which they treat the infinitely greater question of providing superior house accommodation than that which now exists for the masses of the people. A Peel statue elicits a warmer debate in the *present* House of Parliament than Mr. Torrens's bill. Will it be so in the next Parliament and those which are destined to succeed it? This is a matter well worthy of consideration by our public men; and the President of the Liverpool Architectural Association merits thanks for his wise and courageous words.

ARBITRATION IN CASES OF TRADE DISPUTES.

A VERY important meeting was held, on the afternoon of Saturday, the 4th inst., in the lecture-room of the Society of Arts (Mr. W. E. Gladstone in the chair), to consider the desirableness of forming a committee for the purpose of diffusing information on the subject of capital and labour, and of considering the best means of promoting a better understanding between employers and the employed. The meeting was large and influential, and the objects sought to be accomplished cannot be exceeded in importance by any claiming the attention of the public. The opening remarks of Mr. Gladstone were pertinent and forcible. He said that if the committee which it was the principal object of that meeting to constitute were to be successful, the workmen must be approached in a spirit of conciliation; but more than that, they must be treated as reasonable men, as free agents who had a right to accept or reject the conditions of any contract to which they might be asked to become a party. Mr. Gladstone wisely abstained from entering upon any of the disputed points which have been so much discussed, and we cannot but think that, if the same sound discretion had been used by the gentlemen who drew up the resolutions, much useless discussion would have been spared, and the proceedings have ended in a more satisfactory manner. There was evidently a disposition on all sides to meet the question in the spirit manifested by the chairman, and it was the fault of the resolutions that the speakers were drawn away to defend or offer apologies for trades' unions and strikes, and to utter reproaches against the "greed" or "tyranny" of capital—a mode of treating the subject calculated to embarrass the proceedings and defeat the intentions of those who had most praiseworthily convened the meeting.

In justice to ourselves we must say that very much that was said in defence of trades' unions was a pure begging of the question. It was a line of argument similar to that which had been used to sustain the injustice of protective duties. It requires no lengthy argument to show that a powerful body of men may realise a temporary triumph or advantage by combination, by creating, in fact, an artificial scarcity, and if it be true, which we do not dispute, that wages have been kept up in certain districts by strikes, while they have fallen in others where no such strikes have been known, it is possible, nay probable, that the latter is the consequence of the former. It is a simple matter of history that certain branches of trade have been driven from particular districts by a policy of protection. These speeches must have reminded the chairman of the time when he was battling to obtain untaxed bread for the people, and to open the world's markets to their industry, for the same class of arguments are used. Is it always an advantage that a particular body of workmen should keep up a high rate of wages? What we have to regard is the welfare of the whole body of the working-men—the means to raise them up to a higher position. We believe that the way of doing this is now fairly before them, and that co operation and arbitration will bring the results that all good men desire. Great experiments are making in both directions, and the eyes of the whole country are upon them. It is not necessary, therefore, to enter into a conflict as to the abstract right of combinations to keep up the rate of wages. This much will be confessed on all hands, that a strike is a most undesirable method of establishing a claim or of disputing one, if other means can be employed and give satisfaction to both parties. There was not a person in the room who would not most cordially support that proposition, and that is a platform sufficiently broad and clear for pacific, vigorous, and beneficent action. We hope that the committee appointed on Saturday will become more than mere teachers on the subject of political and social economy, and that their conduct will entitle them to become an authority to which disputants will submit their case for decision. We have more than enough of organisations, but believe there is a great necessity for some body of men of character and intellect, who might become, by prudent and conscientious regard to a high trust, arbitrators in trade disputes; but such a body will be all the more useful and all the more powerful from eschewing all discussion upon the more abstract questions upon which so much disagreement exists. Mr. Mundella did not find it necessary to condemn trades' unions in order to carry out his scheme of conciliation. We confidently believe that the state of things will be so much altered that the next generation will look back with surprise that strikes should have been resorted to, to accomplish any legitimate ends, just as the present generation look back upon duelling as a foolish mode of vindicating personal character and honour. Duelling perhaps had its uses, or, what is much about the same thing, was thought to possess them, and a "strike" or "lock-out" is not a more natural mode of enforcing a just claim; it is a mere trial of force, success attending the strongest.

These are our views, and we cannot withhold the expression, but we think that the committee will best ensure the great purpose for which they are organised if they establish themselves upon a basis which all reasonable men will acknowledge—namely, the desirableness of establishing courts of arbitration for the settlement of trade disputes. A public opinion would soon be created in favour of such a conclusion, to which all litigants would ultimately be compelled to bow. We offer this counsel to the committee with the earnest desire to see their labours successful, and that they may attain the dignity of a court of arbitration.

OUR PUBLIC MUSEUMS AND GALLERIES.

OUR public museums and galleries only await proper management to become our most powerful aids in the cause of technical education. Not that we believe, as some seem to do, that you have only to turn an uneducated being loose into a museum to imbibe his mind with a knowledge of all the sciences, but that when a foundation has once been firmly laid in his mind, the advantage he may derive from these institutions is incalculable. Museums and galleries of art in this country are not well managed. Paid for by the many, they are open to the convenience of the few, and can only be visited by the working classes at a sacrifice of that part of their time which is to them emphatically money. We readily admit South Kensington to be an exception. Many bigots, and with them some few sensible men, are opposed to opening our museums on Sundays, but we believe that all concur in wishing them to be open during the evenings and Saturday afternoons. This, however, by itself, would not meet the requirements of technical education. Anyone who has visited South Kensington must have noticed among the intelligent faces directed towards the objects exhibited with evident interest many very stupid-looking ones—not really stupid faces, but faces turned listlessly towards the treasures they have perhaps come miles to see and cannot understand. It is seldom or never seen in the picture gallery. Pictures tell their own tale alike to the educated and the ignorant, but in the other portions of the Museum it is too often met with. How is it to be remedied? How are people to be instructed and interested who come ready and willing to be instructed and interested? We believe it might be accomplished by the delivery of descriptive lectures, at frequent periods of the day, by thoroughly good men on the objects in the various rooms. The suggestion is by no means a novel one, so that if we cannot claim the merit of suggesting it, the authorities need not be frightened at it as an innovation. It was tried at South Kensington, when the Museum was first started, with perfect success, and was only abandoned because the directors could not or would not provide a room in which the lecture might be delivered without disturbance from ordinary visitors. Mr. Buckmaster stated at the recent conference of the Society of Arts, that he was requested by Dr. Lyon Playfair to deliver short lectures on wool, silk, &c., of about twelve minutes duration, and that the visitors crowded to hear him. How much more would they crowd in the natural history room of the British Museum to hear Owen, or Layard, on the Assyrian remains? They would then look upon a Museum as an institution full of interest and information and not as too many of them do at present as a very convenient place in which to spend a wet holiday.

FONTS.

WE have no means of ascertaining at what period "immersion" fell into disuse, and, as a natural consequence, caused the introduction of fonts for baptismal purposes, nor would the cause of art be greatly aided were we able to fix the date, and our time might be more profitably spent in examining the examples which have descended to us than in scheming what might be called the rise and progress of baptismal art. In no other period were fonts so grandly treated as in Norman; thorough manliness of idea united to great boldness and variety of detail were its characteristics, while the mystic Scandinavian and Celtic influence, which had spread over all Europe, seems to have been present in the minds of the designers and workers, and peeps out in quaint interlacings and twisted and coiling dragons and monsters—

> The stony phantoms of a darker world.
> * * *
> By some quaint weird sagacity of art,
> Powerful to touch, e'en by its hideousness.

Though its lines lack the refinement of Early English, and its knot work the vigorous severity of Celtic, Norman still holds its own by the boldness and variety of its free thought, and, mixed and blended as it is with vestiges of old Rome, it gives us more piquant examples of what a font ought to be than any other style.

The most favourite form of font is octagon, and those learned in ecclesiastic symbols tell us that an eight-sided font is the emblem of baptismal regeneration, that a six-sided font is a dangerous heresy—a schism, in fact, in stone, and always to be eschewed. This is a refinement of ideal symbolism which I am not prepared to appreciate, and the chief requisites of a good font which I should like to insist upon are, that the *circular* bowl should be made apparent, or, at least, indicated externally, and that the carved emblems should pertain to the element it holds and the baptism which is celebrated by it. A book of "Illustrations of Baptismal Fonts," which is published by John Van Voorst, contains some very curious and many very good examples in nearly all periods. In the sketch, which forms one of the illustrations this week, an attempt has been made to induce in some parts a Norman or pre-Norman feeling, though in some details, and especially in the font cover, a much later character prevails.

J. M. S.

FREEMASONRY.

THE formation of a society for investigating the antiquities and history of Freemasonry was noticed in the BUILDING NEWS of June 12. The field of inquiry proposed to be entered upon has an undoubted interest for archæologists in general and architects in particular. There is reason to believe the confraternity enjoyed great favour under the Church of Rome, and that the best designers and constructors were among its members. The ancient lodges were probably in communication throughout the Christian countries of Europe, and thus arose the noticeable similarity between English and foreign works, but, as the legal existence and assembling of lodges terminated before the invention of printing, contemporary accounts of their proceedings, if not extinct, are exceedingly rare. Freemasonry was intimately connected with Gothic architecture, but there was a ruling mystery not favourable to personal fame, and the merit of individuals was carried to the common stock of the order. Mystery may have invested the craft at first with wonder, but early admiration gave place to suspicion that was only to be allayed by removal of the object. During the war with France the meetings of men whose proceedings were marked by the very ostentation of secrecy must have been particularly obnoxious to the rulers of the State, though understood and approved by the rulers of the Church. It must have been quite consistent with the position and policy of Henry V. (son-in-law of the French king, heir presumptive to his throne, and meanwhile regent of his kingdom) to foster artistic intercourse between the two countries, and it is by no means improbable that French masons were frequently accepted and enrolled as members of the English lodges. But after Henry's death the opposed bearings of the two kingdoms may have caused Parliament (the really absolute power of the time) to regard with distrust secret organisations within the realm, especially such as united advanced intelligence with the favour of the Church. The meetings of Masonic chapters were declared illegal in 1424, and thus when Gothic architecture was in the highest state of excellence and vigour the springs of its existence were abruptly stopped, a few splendid evidences of the glory to which it had attained serving but to mark its sudden and convulsive end. The subject has extensive ramifications; religion and learning, home and foreign polity, social and personal considerations influenced it. The effect of each must be traced, and the task, we doubt not, will usefully occupy and abundantly repay the combined effort of a special society.

SUPPORTS FOR ERECTIONS IN DEEP WATER.

THE principles of construction in deep water, always important, have at this time an especial interest, from the contemplated establishment of a roadway in some form or other between the French and English shores. Such a work is undoubtedly among the most colossal ever projected, and only to be removed from the chimerical to the possible by the accomplished feats of modern engineers. There are several conceivable methods for effecting such a purpose, as by a tunnel through the rock under the sea, a tunnel laid upon the rock or water-bed, and a viaduct raised far above the surface. To these may be added the notion of a still-way upon the bosom of the sea itself, but the great object is the same in all, namely, the continuous passage of trains from coast to coast without displacement or transhipment. As to a tunnel through the solid rock the experience of Sir Mark Brunel's example at Rotherhithe must not be lost sight of, and concerning the second plan it is certainly one thing to form a tubular way under Tottenham Court-road and quite another to form such a way through the Straits of Dover. In the third scheme, and yet more especially in the fourth, which may be found the most practicable of all, Mr. Thomas Morris* thinks submerged vessels of great ascensive power may become available. Compared with the rock-cut tunnel, the submarine tube, the bridge at a dizzy elevation of 150ft., the engineering difficulties of a still-way appear insignificant. Two continuous lines of pacificators with buoyant supports below the range of navigation might, it is presumed, be so contrived as to give to a belt of the Channel the placid surface of the Thames. There is an interesting novelty about the proposition, and the principle is easily understood. A watertight vessel, for instance, with a floating power of nine tons, has attached to it, by a cable of regulated length, a weight of ten tons, and both are cast into the sea. The weight descends till it rests on the bottom and is followed by the buoy at the distance of the cable's length, but at that distance the buoy stops, and, so far from sinking further, begins to exert its original ascensive force of nine tons, and is capable of sustaining a body or erection of approximately that weight. It is reasonable to suppose that the direct supports of such erection would be of very inferior sectional area to the main float, and this is a point of importance where agitation exists, because the submerged float remains unmoved and carries its load with a steadiness not to be approached by a vessel simply riding on the surface, while the cable is free from the destructive wear and tear to which ordinary moorings are subject.

* Provisional protection has been allowed to Mr. Morris for the application and use of buoys and submerged vessels for supporting objects and erections in deep water.

DESIGN FOR MANCHESTER TOWNHALL.

ON May 22 last we gave a double page illustration of Speakman and Charlesworth's design for the Manchester new Townhall. On another page we give an engraving of the Cooper street and Princess-street fronts.

TAKING OUT QUANTITIES.

THE President of the Liverpool Architectural Association, when speaking of the prize design which had been selected, estimated, and contracted for, and which is now being executed, said:—The estimates for these buildings, contrary to the usual practice of the Corporation, of the Government, and public bodies in general, when estimates for large contracts are wanted, the quantities were not furnished. The consequence was that each of the seven highly respectable contractors who tendered on this occasion was subjected to the expense and trouble in taking off his own quantities. It is only those in the profession who can fully know the care, difficulty, and labour that have to be encountered in taking off quantities, the practical knowledge required, and the numerous and complicated calculations that have to be made; and of these none will deny that builders should have the quantities furnished to them, particularly for large and important public works. The labour and the risk of mistakes, miscalculations, and omissions have been in this case increased sevenfold, and there is an unusual and startling difference in the amount of the highest and lowest tenders. Much misapprehension and ignorance have been recently displayed on this subject, and it has been imagined that an architect, in addition to his arduous task of designing and furnishing working drawings for, and superintending buildings, must also, without extra charge, furnish the contractor with a correct detailed bill of quantities. It cannot be too explicitly stated, nor too generally known, that the professional man who takes off the quantities, whether it be the architect himself or a surveyor mutually appointed, is entitled to a commission of from 1 to 2 per cent., according to the nature of the building to be contracted for. The risk of making serious omissions and mistakes in estimating is greatly augmented when a number of builders are required to take off their own quantities, and many such mistakes have been made, placing both the contractor and employer in a very painful position. No honourable man can wish to live in a house that he has not fairly paid for, though I have listened with disgust, disdain, and anger to the exultation of some who have acquired property in this manner. But no member of the Corporation of Liverpool, either in his individual or corporate capacity, would avail himself willingly of advantages gained by such a course.

An important case, as affecting the political status of the compound householder, has been decided by the Court of Common Pleas. A Mr. Lawson is the owner of a house in Queen-street, Sunderland, which contains six rooms, and each is let to a separate tenant. Neither the landlord nor any one representing him resides on the premises. Previously to the passing of the Reform Act of last year Mr. Lawson paid all rates, but since then the overseers have rated each occupier separately. The question was, whether this was right, and it depended upon the construction of the seventh section of the act, which is in effect that where any dwelling-house or tenement shall be wholly let out in apartments or lodgings, not separately rated, then the owner shall be rated. The court unanimously held that the occupiers were not entitled to be severally rated, and that the rate should be made out in the name of the landlord.

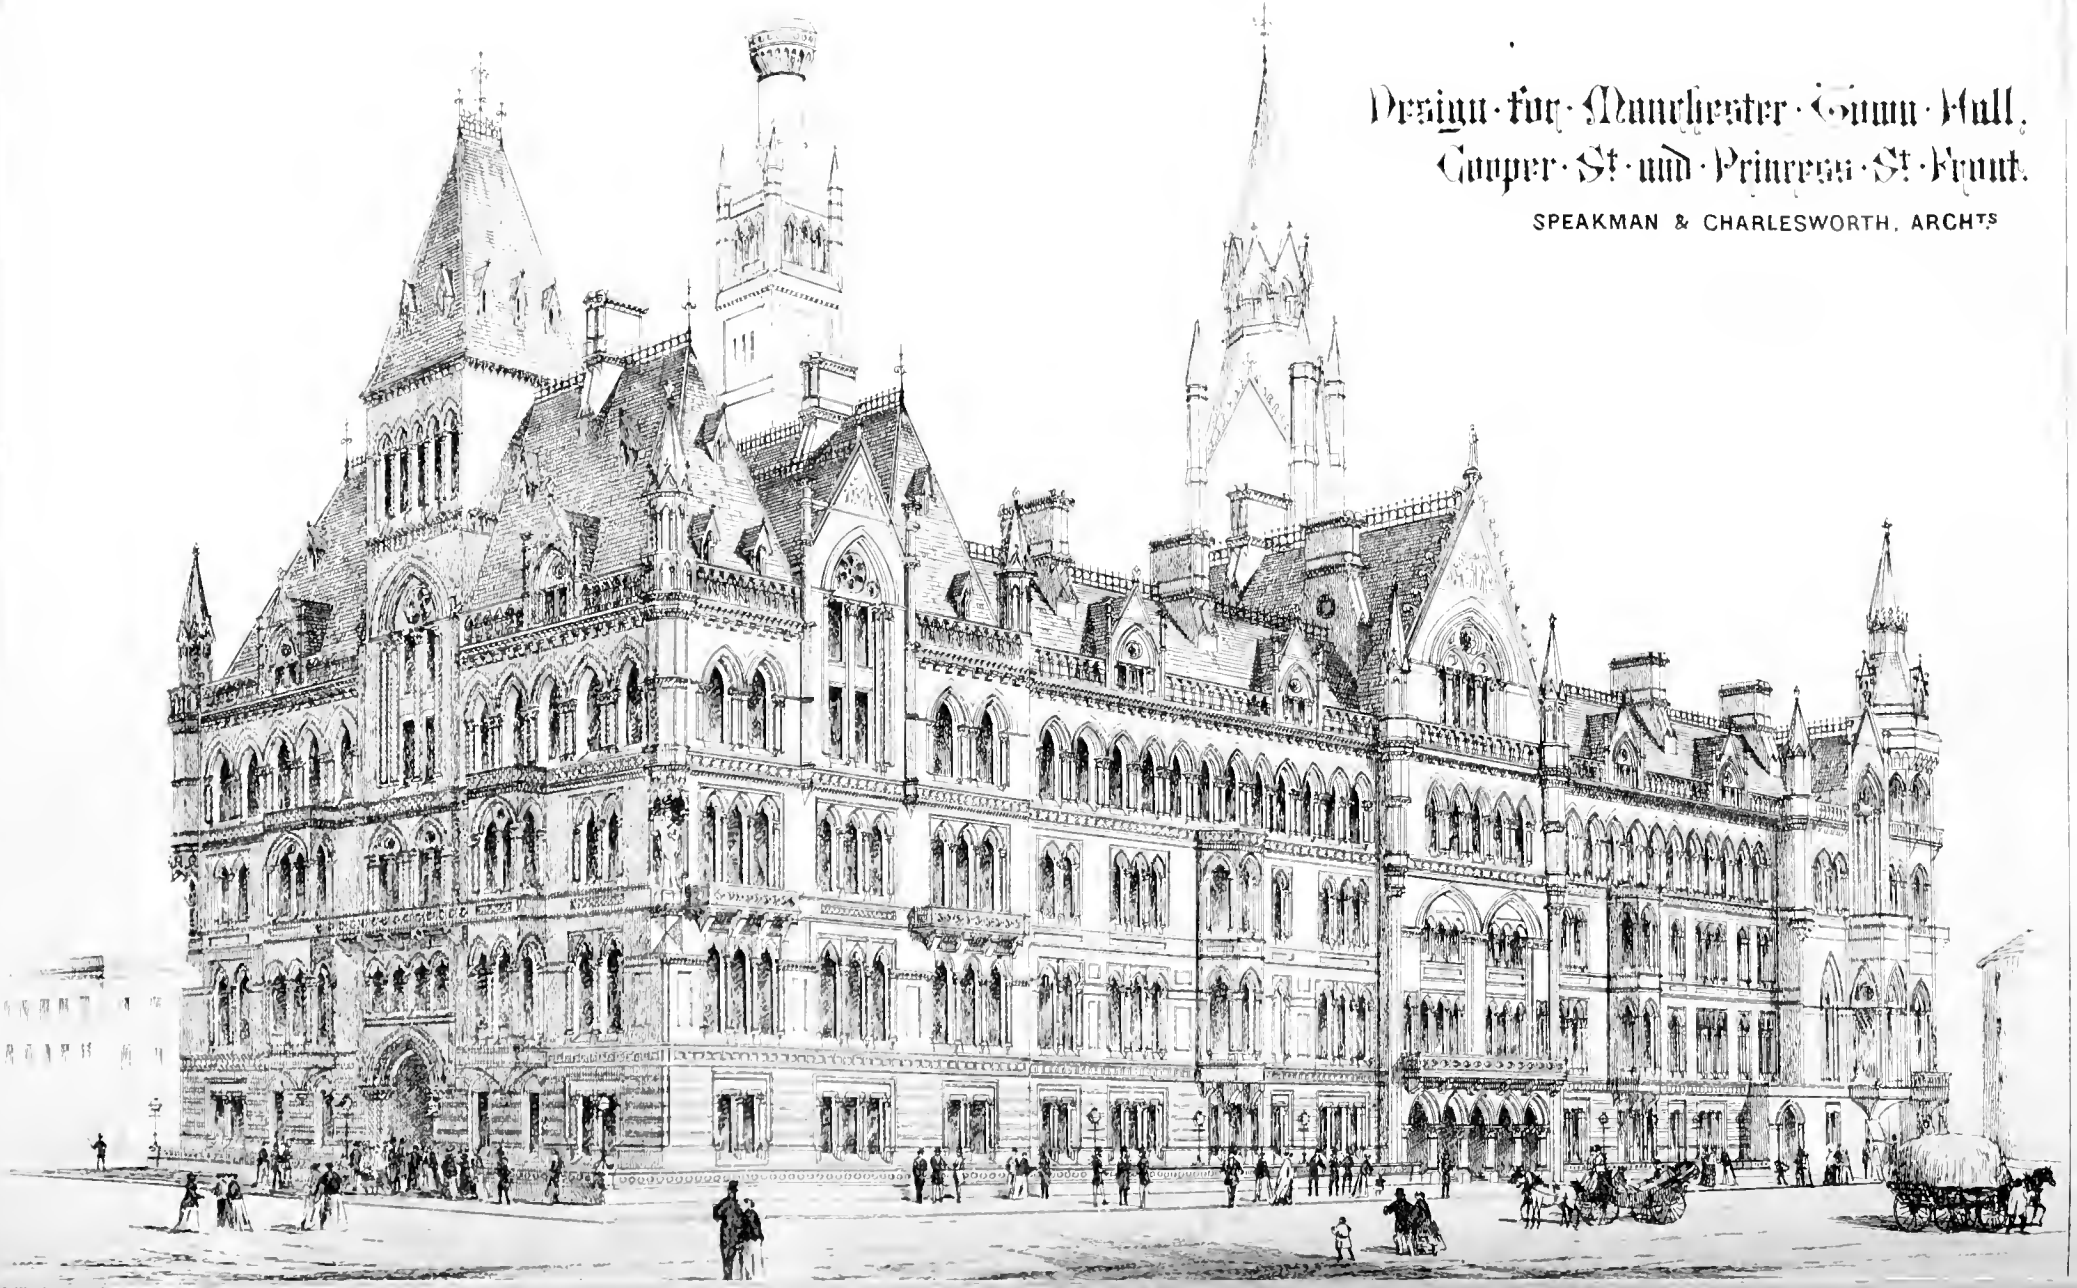
SPEAKMAN & CHARLESWORTH, ARCHTS



LA BELLE FRANCE.*

THIS is an elegant volume containing a series of pleasant pen and ink sketches (here and there illustrated by the engraver) of a number of the most celebrated provincial towns of France, by one of the best known of English female essayists. Madame Parkes-Belloc has wandered leisurely through Burgundy, Brittany, and Touraine, Normandy, Picardy, and Provence, halting on the way to sketch the famous old world towns, with their grand old cathedrals and their quaint and picturesque street architecture—among the rest we have Bourges, Meaux, Rheims, Guingamp, Chartres, Lens, and Abbeville—and to narrate the memorable events and romantic episodes interwoven with their histories. Some of the scenes and spots described by Madame Parkes-Belloc have been described to us before, but there is a freshness and brightness about her pictures which cannot fail to make them welcome to English readers. "Composed," as she tells us, "from an antiquarian and poetical view only, they aim at nothing but the preserving for English readers some traces of that wonderful beauty which is yearly vanishing like a dream." The author has a fine appreciation of the beauties of the old French architecture, and among the best things in her book are the sketches of Bourges and Guingamp. The former place is celebrated for its cathedral, and one of the chief architectural features of Guingamp is its public fountain. We have given engravings of these taken from the work, which, we may add, is as admirably illustrated as it is interestingly written.

THE CATHEDRAL OF BOURGES

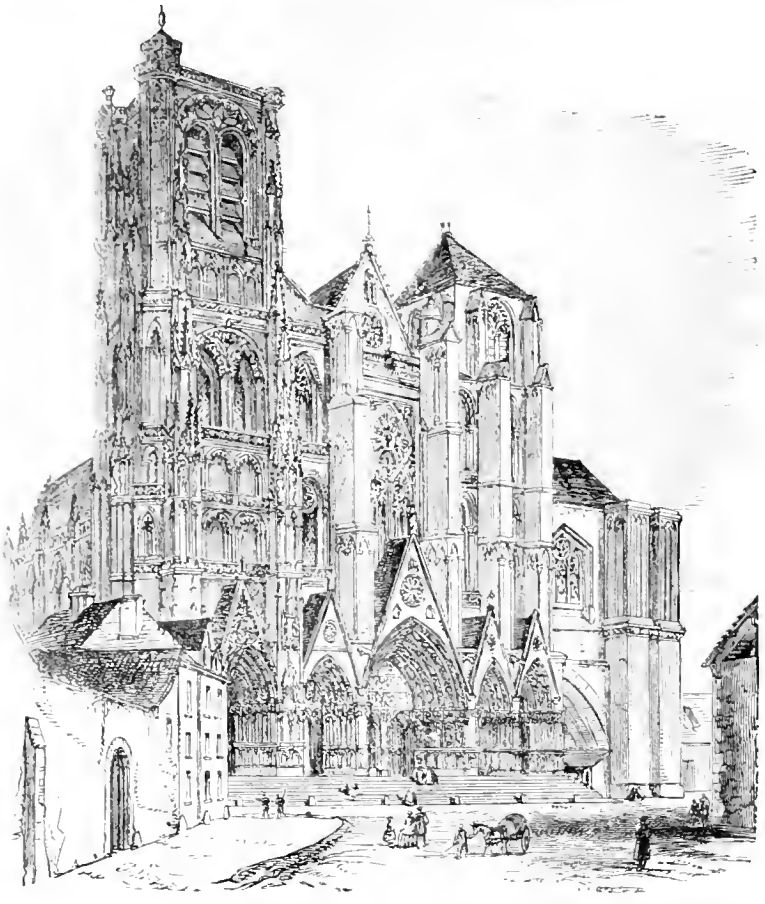
Is one of the four great cathedrals of France; Amiens, Rheims, and Chartres are the other three. The present edifice is the fourth of its name, the first having been built A.D. 250, in the days of Roman Gaul. It was rebuilt in 380, and again in the ninth century. Some fragments of this last erection yet remain, but the glorious church now called St. Etienne de Bourges dates from the early part of the thirteenth century. It occupies a picturesque situation high above the ramparts south east of the town. The building has no transepts, but a double aisle on either side of the nave. The perspective, says Madame Parkes-Belloc, flies away like that of Westminster Abbey, and is lost in a glimmer of painted glass. The pillars are remarkable for their great height, and they number, large and small, nearly three thousand. The capitals of the columns are beautifully designed and richly carved. The aisles are always dim, even at noon, so rich is the painted glass, which is considered among the most beautiful in the world. About the middle of the last century eighteen of the windows were sacrificed because the worshippers could not see to read their prayer books—a remote consequence, as the author remarks, of the invention of printing! There is a subterranean church or crypt containing some fine monuments, which were deposed from the upper church in the troublous times of 1793.

THE FOUNTAIN OF GUINGAMP

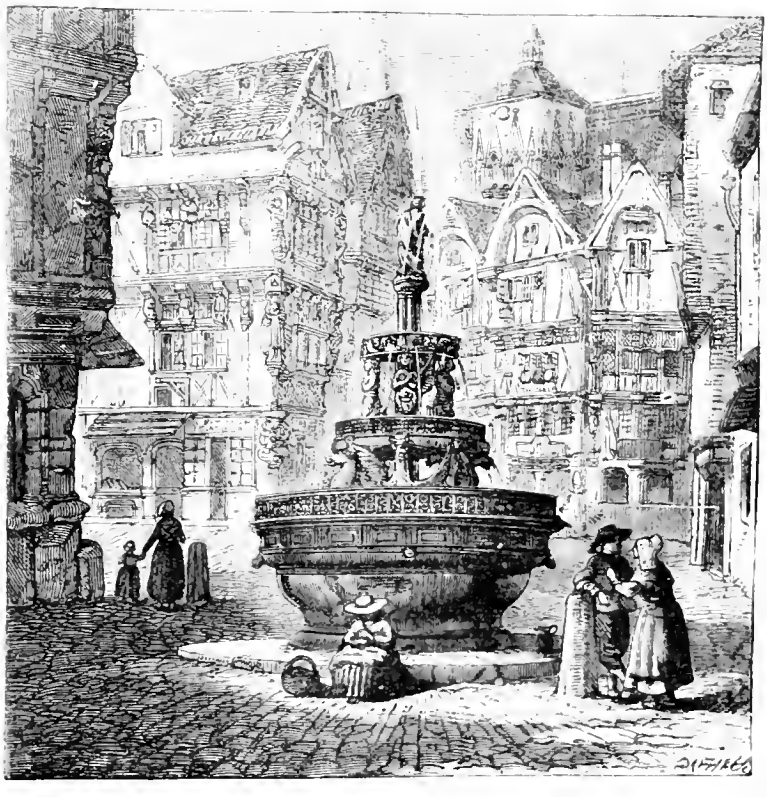
Stands in the marketplace of that ancient town of Brittany. It was erected in the year 1745, supplanting a similar structure which had been given to the town about three hundred years previously, by Duc Pierre, the husband of the pious St. François d'Amboise. The fountain comprises three basins of granite, the lowest being encircled by a railing of wrought iron; the second is upborne by four seahorses, and the third by four sirens, and ornamented by heads of angels and dolphins. The whole is surmounted by a statue of the Virgin, her feet resting on a crescent, and twenty jets of water are made to envelope her like a veil. This interesting monument is the work of Yoes Corlay, who, bred a carpenter, discovered in handling the tools that he was born an artist, and was afterwards known as the celebrated sculptor of Château Landron. Of Corlay and his fountain there is a charming story told. It is too long to give here, but the reader will find it, with many other good things, in Madame Parkes-Belloc's book.

*"La Belle France," by BESSIE PARKES-BELLOC, author of "Vignettes," &c. Strahan and Co. 1868.

LA BELLE FRANCE.



THE CATHEDRAL OF BOURGES.



THE FOUNTAIN OF GUINGAMP

VENTILATION OF THEATRES.

THE intense heat that has prevailed during the past fortnight, says the *Lancet*, must surely have caused managerial attention to be directed to the very bad quality and insufficient supply of the air in all London theatres. It appears, indeed, that in the matter of ventilation, as of acoustics, the architects of the present day are either utterly careless or profoundly ignorant. Five theatres have been built or rebuilt in London during the past twelve years, and it is evident from the thermal condition of their interiors during the hours of performance that very little improvement has lately taken place as to theatrical arrangements for ventilation. It is a fact that "Old Drury" is the coolest as well as the oldest metropolitan theatre; but this circumstance is due to the immense depth and width of space behind the curtain, from which currents of air proceed that frequently render the stalls untenable by any but cloaked enthusiasts of the drama, and the ardour of opera-goers must be somewhat chilled by the somewhat violent zephyrs that play around them on windy nights. The evils that afflict playgoers are patent to all who can be classed under that category: but it is as well to remind them that those who work behind the foot-lights for their amusement and edification are even worse off than the public. Soprano, first lady, tenor, and ballet girl can each and all give unhappy experiences on this head; and it is not too much to assert that many a good voice has been prematurely crippled by superlative carelessness as to draughts behind the scenes. Many diseases are far more easily prevented than cured, and notably those of the respiratory organs. It is a duty to the public to point out that such diseases are but too often engendered in badly ventilated places of public resort; and the managers of theatres are bound, in catering for the amusement of the public, to provide for that public such accommodation as shall not be antagonistic to the known laws of sanatory science.

POTTERY AND PORCELAIN.

THE fifth of the course of lectures promoted in illustration of the National Art Exhibition was delivered on Tuesday in the Leeds Philosophical Hall, by Mr. William Chaffers, superintendent of the Exhibition Museum of Ornamental Art. An interesting account was given of Greek and Roman pottery, and of the pottery produced in Britain and Germany and France during what were known as the Saxon and Frankish periods. The decorative pottery that was afterwards introduced was very fully described, reference being of course made to the heroic patience manifested by Bernard Palissy in his efforts to produce enamelled ware; and to the extremely high prices that were now paid for some of Palissy's productions, and the numerous and clever imitations of them that were often made, and frequently bought as the genuine workmanship of this great master in the plastic art. Previous to the sixteenth century he remarked that earthenware produced in England was rudely fashioned and devoid of ornamentation, although occasionally covered with glaze, and sometimes cast in moulds that gave peculiar forms. These productions were both expensive and badly burnt, and not very durable; and the consequence was that German stone-ware was eagerly sought for, and as early as the sixteenth century large quantities of it were imported into England. English pottery subsequently underwent great improvement, and he thought that a careful inspection of such specimens as were preserved would dispel any impression that the art in this country had, previous to Wedgwood's time, sunk to a very low ebb. There were examples to be found of English pottery of a date a century before Wedgwood's time that would have done credit to that distinguished artist himself. The lecture was brought to a close with a reference to English pottery manufactures of the eighteenth century, Leeds ware being specially mentioned.

SEWAGE EXPERIMENTS AT TOTTENHAM.

ON Tuesday afternoon the experiments for the purification of sewage by means of a particular preparation of alum, according to Mr. Lenk's process, were resumed at the sewage works of the Tottenham Local Board of Health, in the presence of several members of the board and their engineer, Mr. Marshall, together with numerous other gentlemen interested in the question. The experiments were conducted by Mr. Lenk, of Dresden, the inventor of the process, and Mr. Lennig, of Upper Thames street, the patentee for this country. A tank measuring about 50ft. in length by 20ft. in breadth, was filled with 26,000 gallons of sewage, very black in appearance and extremely offensive in smell. Forty-six gallons of the purifying "essence" were then sprinkled over the surface of the fluid by means of a hydropult, and afterwards stirred in by the aid of a wooden apparatus roughly improvised for the purpose. The fluid was then allowed to settle, and the action of the essence was at once apparent, a peculiar agitation taking place, caused by the chemicals combining with the impurities and precipitating them to the bottom of the tank. In about ten minutes, and at intervals afterwards, bottles were plunged into the deepest portion of the fluid, and on being brought to the surface and examined, the transformation was apparent, the fluid being perfectly transparent, though slightly tinged with blue. In half an hour the whole body of the sewage was in a very advanced state of purification. So far as could be judged by the eye and by the sense of smell, the fluid was perfectly fit to be discharged into the river. The materials employed in the purification are different combinations of alum, and the cost is understood to be very trifling.

THE DEBTS OF THE METROPOLITAN BOARD OF WORKS.

A RETURN has been issued showing all moneys owing at the time of the formation of the Metropolitan Board of Works, and the rates of interest thereon; the amounts borrowed since, the purposes for which they were intended, and the security given for the same; the amounts paid off, with the dates of payment, and the amounts owing by the Board on January 1, 1868. The total amount owing at the formation of the Board in 1856 was £425,300, and the amounts borrowed by the board since that time are for the Victoria Park approaches £42,000, of which £21,000 have been paid off; for the Covent Gardeu approach, and Southwark and Westminster communication, £400,000, of which £100,000 has been paid off; for the main drainage £4,200,000, of which £950,000 has been paid off; for the Finsbury Park £50,000, of which £5,000 has been paid; for repayment of Rock Loan £135,000, of which £40,500 has been repaid; for the Southwark Park, Whitechapel improvement, Holborn improvement, and main sewer, £616,000, of which £18,533 6s. 8d. has been repaid; for the Thames Embaukmeut and Mansion House-street £2,480,000, of which £385,000 has been repaid. The total amount borrowed up to January last was £8,073,000, of which £1,520,633 6s. 8d. has been repaid, leaving the sum of £6,552,366 12s. 4d. still outstanding. The rates of interest at which the money has been borrowed vary from 3¾ to 4½ per cent.

Building Intelligence.

CHURCHES AND CHAPELS.

Mr. A. Sussex Milbank has presented to the parish church of Barningham, York, a handsome illuminated corona with four lamps, enriched with ruby and crystal settings. It bears the inscription in mediæval characters, "Given by Sussex Milbank, 1868." There accompany it two lamps for the reading desk of corresponding pattern. The whole are from the manufactory of Messrs. Hart and Son, London. It is worthy of remark that the only other chandelier in the church was given by an ancestor of Mr. Milbank 130 years ago.

Christ Church, Camberwell, has been consecrated and opened for Divine service. The style of the church is based upon the Early French Gothic, having a very commanding tower and spire, rising to the height of 140ft. Accommodation is provided for 1,200 persons. The church has been built at a cost of about £6,000. The contractors were Messrs. Dove Brothers. The carving throughout has been executed by Mr. Sansom: the ornamental ironwork, from architects' own designs, by Messrs. Hart and Son Marble work was executed by W. H. Burke and Co. The architect was Mr. Bassett Keeling.

Sedgeberrow parish church has undergone extensive works of restoration. The church consists of nave and chancel, with an octagonal tower with spire, total height, 104ft. About two-thirds of this spire has been rebuilt, and the exterior walls have been rebuilt from the window heads upward. The total cost of the work was about £2,000. Mr. W. Butterfield was the architect employed.

The foundation stone of a new chapel at Broughton, near Kettering, was laid on the 24th ult. The chapel is to be built in the modern style of architecture. Mr. Charles Dawkins, of Broughtou, is the contractor, and Messrs. E. Habershon, Brock, and Welch, of London, are the architects.

The new Roman Catholic Church of All Saints, Barton-on-Irwell, was consecrated on the 18th ult. by Dr. Manning. The plan consists of nave, chancel, and aisles. The total internal length is 140ft., and the width 34ft., the nave and chancel being 20ft. wide. Accommodation is provided for 550 persons. Exterually the building is finished with Yorkshire pierpoints and Stourton freestone dressings. A large presbytery adjoins the church. The total cost of the works was £20,000. Mr. E. Welby Pugin was the architect and Mr. Glaister, of Liverpool, the contractor.

The report of the Leicester County Town Church Building Society was read at their annual meeting in that town on the 26th ult. Since the last annual meeting of the society the following grants have been paid, the usual certificate of the completion of the works in each case having been produced to the Central Committee, viz., Ashby Parva, £20; Illston-on the-Hill, £20; Glooston, £30; St. Matthew's, Leicester, £250; Arnesby, £50; total, £370. The balance in the treasurer's hands now due to the society amounts to the sum of £32 8s. 8d., exclusive of the sum of £200 in Exchequer bills.

BUILDINGS.

New national schools have been erected at Prittlewell, near Chelmsford. The cost of the building, including residence for master and mistress, was £1,500. Messrs. Wenham and Blake, of Westminster, were the architects, and Mr. Carter, of Rochford, the builder.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

NOTICE.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

RECEIVED.—I. S. B.—I. T—C. F. R—E. H.—M. and Co.—I. S. G.—I. F.—C. C., Paris, declined with thanks.—E. W. G.—I. P. S.—I. M. S.—A. S.—S. H.—I. G.—M. H. and Co.—I. F. H.—I. C.—H. and Co.—F. F. M.—I. L. H.—R. D. and Co.—G. I.—W. V.—W. W. and Bros.—C. R.—H. B. P.

W. H. T. (Ipswich.) Mr. Tall's address is Falstaff-yard, Kent-street, Southwark. By an oversight the address was not appended to Mr. Tall's large advertisement last week. The pamphlet on concrete building, by Tall's apparatus, can be had by enclosing twelve postage stamps to the above address.

ANDREW SCOTT.—We do not know the address of "Miller," who sent Intercommunication question 891.

C. C.—Of course you can. The curvature of an arch may very vary considerably. When the arch is low the circle it belongs to becomes very large, and the strength of arches varies greatly with their form; they may either be segments of a circle, a parabola, an ellipse, an hyperbola, or a catenary.

Correspondence.

THE SIDES OF WESTMINSTER HALL.

To the Editor of the BUILDING NEWS.

SIR,—An adage says there are two sides to everything—a good side and a bad, a right side and a wrong; a one-sided thing is, in fact, anomalous and repugnant. Some things have many sides, but these remarks concern exclusively the two grand lateral ranges of Westminster Hall.

The western may be called the statutory side, because lined by courts where the statutes are expounded and enforced. The eastern may with equal reason be termed the statuary side, because lined by statues of kings. These latter being on their trial a word may be said in arrest of judgment if the verdict has not been already recorded. As objects composed of statue and pedestal they want importance, but the want relates to elevation only. In the studio, probably, the figures would appear sufficiently raised for convenient contemplation, and a proper relation of figure and pedestal may be said to exist, but for the situation in which they now stand each mass requires an addition of four or five feet, and that addition might be given to the pedestal alone. Not, indeed, to the present eminently vulgar objects of the kind, but to properly devised supports, charged, it may be, with "predella" illustrations, armorials, or legends of the kings portrayed. The further question of congruity may be safely waived when the artistic necessities are fulfilled, since these figures are not in the nature of structural accessories, and are, therefore, free from the rules in such cases. Any attempt to incorporate them with the building would be absurd, but their introduction as detached works may be appropriate and desirable. Progression in style is as inevitable as it is welcome, and, therefore, while fully recognising the imperative nature of synchronism in the constituent parts of an edifice we are disposed, so far as regards merely adventitious ornaments, to insist rather upon fitness of subject, sustained proportion, and artistic value.—I am, &c.,

T. M.

DETACHED LABOURERS' COTTAGES.

SIR,—In your last number you published a plan of a labourers' cottage, designed by Mr. J. T. Smith, of Ealing. You state that "the Central Cottage Improvement Society, in 1866, offered a prize for the best plan of a cottage, consisting of good living room, scullery, pantry, &c., and three bedrooms, which could be erected for £105," and that "the prize was won by Mr. J. T. Smith." You then say, "we give this week illustrations of front and back elevations, section, ground, and chamber plans, as submitted by Mr. Smith." These statements are inaccurate, as Mr. Smith did not win the prize, and the plan you published is not "as submitted by Mr. Smith" for competition in 1866. It is true that Mr. Smith's plan was selected for the first prize conditionally, the condition being that it could be erected for the money stated, viz., £105. The council found that that could not be done, and the condition not being complied with the prize has been withheld. It was also found that by Mr. Smith's plan the staircase was so badly arranged with respect to headway as to destroy the usefulness of the third bedroom, which defect was concealed in the plan by the introduction of a bed. In the plan you have now published, that defect, no doubt, has been to some extent rectified, but the plan is not "as submitted by Mr. Smith" in the competition of 1866.—Signed on behalf of the council,

J. F. FORTESCUE, Chairman.

Central Cottage Improvement Society, 37, Arundel-street, Strand, July 8, 1868.

[We inserted the plan as sent by Mr. Smith, and a good plan it is for a £105 detached cottage. We were given to understand there was some dispute between Mr. Smith and the committee, into the merits of which we cannot enter.]

Intercommunication.

QUESTIONS.

[913.]—IRON SEMICIRCULAR ROOF.—Will you please allow me to ask your correspondent "Calculator" how he would get out the proper sectional area of the flanges and web of a semicircular roof of 70ft. span, either of the lattice or plate girder form? Also what depth of girder he considers right for such a span? Would he recommend a plate to be stronger than a lattice girder of this arched form.—AN ENGINEER'S PUPIL.

[914.]—ETCHING GROUND.—Far from satisfied with the etching ground sold by artists' colourmen, I want a recipe to make my own by. Will some reader oblige?—AN AMATEUR.

[915.]—DRY ROT.—Some of the floors and skirting of my house are falling a prey to the dry rot. I have made air openings under the floors, but have experienced no benefit. I wish some one would suggest a remedy. Possibly it was inherent in the timber. If so, how can such potential frailty be detected.—PATERFAMILIAS.

[916.]—STAINING WOOD.—I want to stain deal a mahogany colour. Can any reader give me a recipe for this purpose at once cheap and effective.—X. P., Penygelli, North Wales.

[917.]—FASTENING ZINC ROOFING.—I am about to use zinc as a roofing for a building. I am informed there are two or three ways of fastening the zinc. I should like to know something of the different plans adopted.—INSPERT.

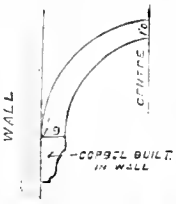
[918.]—FLUSHING HOUSE DRAINS.—Can any of your correspondents inform me as to the best means of flushing house drains. I find during this dry season a very offensive smell arising from my drain, no doubt caused by the diminished quantity of water running down it. Is there any cheap and efficient method of storing up the water and letting it off at intervals. I have heard of some self acting apparatus for that purpose. Where is it used, and with what success? All practical men will understand that a gallon of water thrown down a drain in the way that a bucket would deliver it is worth twenty gallons constantly flowing in driblets. I am satisfied that occasionally flushing a drain is of great advantage at all times. And that all houses should be provided with the means of doing it; therefore the importance of my inquiry.—TIM.

[919.]—PAINTING WOODWORK WHITE.—I shall be obliged if any of your readers can inform me the proper way to paint new woodwork white, and to varnish same after painting for inside work, so that it will keep its colour; and the materials used.—ENORAMUS.

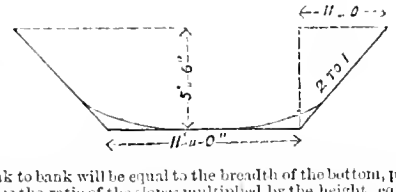
[920.]—RUBBING MONUMENTAL BRASSES.—In rubbing monumental brasses I am sometimes unable to prevent the heel ball going over the margin of the brass and taking an impression of the stone, and this injures the sharp outline that the rubbing would otherwise have. Can any of your readers inform me how best to remove the superfluous heel ball from the rubbings?—A. L.

REPLIES.

[890.]—SEMICIRCULAR IRON ROOFS.—I think "Calculator" is wrong as to the form of these roofs; instead of the intrados and extrados being parallel, they ought to be more as per sketch; or, as your readers will know better perhaps, if I say like the Kensington and King's Cross stations of the Metropolitan Railway, which appeared to me when I saw them as being of the dimensions I have written on the sketch. I have no doubt that "Calculator" could give "Young Engineer" an example of his working one of these arches out, judging from the way he starts; but I always thought it a difficult problem, and gave it up years ago, being no mathematician. I think "Young Engineer" could work out a laminated wood rib and render it fireproof by the method you described of Sir W. Burnett's in your paper some time ago on the preservation of timber. The new Midland station in the Euston road, London, has its slate boarding preserved so by this process, to render it incombustible. I consider your "Intercommunication" column as good as belonging to a discussion society.—J. RICHARDSON, Lincoln.



[891.]—WIDENING AND DEEPENING A STREAM. "Miller" should make his cross section, as in the annexed diagram. The total breadth of the stream at top from



bank to bank will be equal to the breadth of the bottom, plus twice the ratio of the slopes multiplied by the height, equal to 11 + (1 × 5.5), equal to 22ft. The slopes may be made watertight by puddling, or concreting, or asphalting. If good puddle can be had at hand, it will be the cheapest way of doing the job; but it must be well done or the banks will leak.—CONTRACTOR.

[892.]—GEOLOGICAL SURVEY OF ENGLAND.—Write to Stanford, of No. 5, Charing Cross, where you will obtain all information respecting the published plans of the Ordnance survey of the whole of Great Britain.—P.

[893.]—SPIRIT LEVEL.—I should advise "A Beginner" to purchase a Gravatt's dumpy level either at Elliott's, Charing Cross, or at Troughton's in Fleet-street. The Y level is cumbersome and heavy, and although its adjustments are made with greater facility than the other two, yet, on the other hand, they are also more easily deranged. A dumpy level once put in thorough and sound adjustment will remain so for years, unless subjected to wanton bad usage or gross carelessness, from both of which contingencies the owner ought to be able to secure it. Where very minute accuracy is required, the Y level is to be preferred for levelling; but for general practice the dumpy possesses advantages well known to every professional man. Troughton's instrument is one in which the bubble tube has no separate adjustment of its own, but is made by construction parallel to the optical axis of the telescope. It is rarely used now.—SURVEYOR'S CLERK.

[894.]—BREAKING WEIGHT OF BOX GIRDERS.—The general formula for solving the question asked by your correspondent "J. J." is that deduced from the elaborate series of experiments made during and previous to the construction of the Menai Bridge, and is as follows:—Let W equal the breaking weight of a girder applied at the centre; A the sectional area or number of square inches in the top flange; D the depth in feet; L the span in feet; and C a constant; then $W = \frac{A \times D \times C}{L}$. The value of the constant C depends upon the description of the girder, and in the case referred to may be taken equal to 80. To solve the problem put forward by "J. J.," we have, supposing two ¾in. rivets to be in the same line of plate, A = (22.5in. × ¾in. + (18.5in. × ½in.) = 23.31 square inches, and putting for D and L their respective values the calculation stands $W = \frac{23.31 \times 5 \times 80}{75}$. Solving, we find the breaking weight of the girder at the centre to be 124 tons; and, as a girder will always bear twice the weight uniformly distributed over it that it will at the centre, the one in question will require 248 tons to break it down. I trust this will afford satisfaction to "J. J."—L. R. D.

[898.]—WELL DIGGING.—"A. B. C." thinks he was not sufficiently explicit about the required information for the above. It should have been, "What is the price of labour only for digging and steining a well 30ft. deep, 4ft. diameter." "W. W." stated 10ft. diameter and 30ft. deep. The price he stated would be much too high for labour and materials, viz., 8s. 6d. per foot.

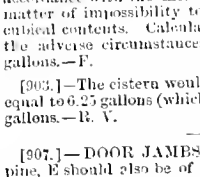
[899.]—QUERIES.—With your permission, I will answer a couple of the queries asked in your columns of June 26, by "T. L. P." Timber, strictly speaking, commences from the half balk; and when sawn into thinner lengths is denominated battens, when from 6in. to 7in. in breadth; deals when 9in., and planks when 11in. in breadth. The real reason why the majority of pipes leak at the joints is, that they are not properly bedded, as the least settlement is sufficient to cause the joints to draw. To prevent leakage, the joints should be well secured with clay, and plugged up tightly by men accustomed to the work, and there will be no necessity for the employment of either tar or asphalte. —PIPELAYER.

[899.]—Asphalte will make a watertight joint to earthenware pipes, glazed or not. The ends to be united should be made hot, to encourage the asphalte to flow. The labour upon this kind of work would be great, and seems to tell against the application of such a material. Why not try good Portland cement to make joints? It would not be so good as asphalte, yet might answer "T. L. P.'s" purpose. —W.

[900.]—BOLTED GIRDER.—In reply to your correspondent "F." who almost drowns his questions in a "sea of words," I should say that two pieces of timber 12in. by 4½in. bolted together at every 4ft. or 5ft. with ½in. screw bolts, would be stronger than one piece 12in. by 9in.; and by having the grain of the pieces bolted running in opposite directions, strength would, I think, be gained. I would also add, that "setting aside prejudice and preconceived notions and ideas" would not, in my opinion, in any way effect the strength of a girder.—PITER.

[903.]—CONTENTS OF CISTERNS.—Assuming the sizes given to be the size of cistern inside, it will contain 119 gallons of water when full. Common rule, cubic feet, × 6¼ = gallons.—R. P., Edin.

[903.]—"Inquirer" has omitted to give one dimension of his cistern, which is necessary for the correct calculation of its contents, and that is the length of the diagonal A C. If it be assumed that the angle A B C is a right angle, this diagonal will, of course, be 2ft. 6in. On this supposition, the quantity of water which the cistern is capable of holding will be 149.57 gallons; a gallon of water being assumed to contain 277.274 cubic inches.—R. L. B.



[903.]—"Inquirer" has not plotted his cistern at all in accordance with the measurements; consequently, it is a matter of impossibility to work out the exact area for cubical contents. Calculating as near as practicable under the adverse circumstances, it would contain about 125 gallons.—F.

[903.]—The cistern would hold, reckoning one cubic foot equal to 6.25 gallons (which I believe to be correct), 126.5625 gallons.—R. V.

[907.]—DOOR JAMBS.—If F on his plan is pitch pine, E should also be of the same material, as the doors on the opposite side of passage have no connection.—W. HUMPHRIS.

[907.]—"Clerk of Works" cannot possibly have stated his case correctly. E and B on sketch are not doorways into D evidently; neither does one open into the hall, as he states. However, taking his evident meaning from the letter-press, I should say the jambs in question should be of the superior class of work.—F.

[919.]—ASPHALTE AND GRAVEL.—All work in asphalte must be executed upon a solid foundation. Form one composed of clean gravel and lias lime, and bring the surface level and fair. Should the barn floor be for thrashing upon or hauling over, 1in. or 1¼in. of asphalte should be laid down. Where used for the storage of grain only, ¾in. or ⅞in. in thickness would be all sufficient. All the floors of the barns upon the Duke of Bedford's estate at Woburn were laid ¾in. in thickness upon concrete. Claridge's asphalte of Soyssel, from the company at Stangate, was the material employed.—W.

WAGES MOVEMENT.

A MEETING of the operative masons in the Halifax district has been held on the question of wages. The men have given notice of an advance of 2s. per week. The masters offer 7d. per hour on the 50½ hours a week, bringing the wages up to £1 9s. 3½d. a week, the present wages being 28s. The men are opposed to the hour system, and have decided not to accept it. The notice of the men terminates on the 22nd inst., before which date another meeting will be held.

The whole of the plasterers in Barnsley struck work on Monday last, for an advance of 2s. per week on the present wages, and a reduction in the working hours. The men have now 26s. per week, and they ask for 28s. and to begin at seven o'clock in the morning during five days in

the week, and give over at half past five; and on Saturday to be at the pay offices by four o'clock. It is said that the masters do not so much object to the advance of wages, but will not concede to the reduction of hours asked for.

It is stated that the master builders of Birmingham have now a sufficient number of non-society men to carry on all their works. The matters in dispute with the Union men were the worked stone question, piece-work, and sub-contracting. On these, and all other questions, the non society men accept the masters' rules. They have been engaged for twelve months certain.

The strike with the bricklayers at Walsall is at an end. They have commenced work according to the terms offered them by the employers, that is, no interference with regard to society or non-society men. Hours of labour to commence at seven o'clock on Monday mornings, and to one o'clock on Saturdays; sixpence per hour for the summer months, and sixpence-halfpenny the winter months, for skilled workmen. Six weeks before Christmas and six weeks after to be the winter portion.

STAINED GLASS.

A stained glass window has just been placed in Trinidon Colliery Church, Durham. The subject is Jesus blessing little children. Messrs. Cox and Son, of London, were the artists.

A stained glass window has been placed in the south side of the parish church of Kimbolton. The subjects are the Resurrection and the appearance of the angel at the tomb. Messrs. Avey and Sons, of London, were the artists.

LAND AND BUILDING SOCIETIES.

An order to wind up the Victoria Land and Building Society, Birmingham, has been made by the Court of Chancery, as it was found impossible to carry out any scheme for realisation without the sanction of the Court. The committee of investigation are actively engaged in preparing a report, which will be issued in a few days, and it will then depend upon the decision of meetings of the shareholders and creditors of the society whether the winding up is to go on, or whether some scheme can be arranged for an easier settlement.

The directors of the Sovereign Permanent Building and Investment Society have declared an interim dividend for the society's first half year, ending June 30, on all paid up shares, at the rate of 6 per cent. per annum.

On the sixty-third quarterly meeting of the sixteenth year of the members of the Conservative Land Society held on Tuesday, the 7th inst., Viscount Ranelagh in the chair, the report of the executive committee stated that up to midsummer the £50 shares issued were 30,047, representing a subscribed capital of £1,502,350. The quarterly receipts were £49,697 6s. 4d., and the grand totals to midsummer, £1,255,517 17s. 1d. The total withdrawals had been £321,532 12s. 8d. The sale of land amounted to £636,276 17s., and the reserve fund to £12,104 5s. 2d. The first portion of the Clapham Junction estate has been entirely sold, and a large quantity of the second allotment had been also disposed of. The board would offer before the close of the financial year at Michaelmas the Holloway estate, the Waterslade estate, Red Hill, and the Northampton estate. The report concluded by announcing that the advance department would be the main business of the society after Michaelmas, the land operations being carried on by the United Land Company (Limited), but both associations would work on the co-operative principle. Among the directors and members present were, Viscount Ranelagh, Colonel B. Knox, M.P., Hon. Robert Bourke, Hon and Rev. W. Talbot, Colonel Meyrick, H. W. Currie, Esq., J. Goodson, Esq., M.P., T. K. Holmes, Esq., C. E. Newcome, Esq., Henry Pownal, Esq., J.P., N. Winstanley, Esq., Captain Strode, Messrs. Sangster, Farquharson, Stewardson, Batchelor, Poole, Turner, &c.

At a meeting of the promoters of the Salford Improved Industrial Dwellings Company (Limited), held in the Townhall, Salford, on Monday, the memorandum and articles of association were finally adopted, and ordered to be signed and registered; and the Mayor (H. D. Pochin, Esq.) and Messrs. Oliver Heywood, Henry R. Greg, Charles E. Cawley, and Thomas Davies were appointed directors, and Mr. Samuel Tilzey, the secretary of the Company. Several sites, upon which to erect cottages, were brought under consideration and it is expected that the Company will at once begin to carry out the object for which it has been formed.

LEGAL INTELLIGENCE.

Peto, Betts, and Crampton's Bankruptcy.—On Monday Sir Morton Peto and Messrs. Betts and Crampton, whose bankruptcy took place about twelve months ago, appeared before Mr. Commissioner Winslow, passed their examinations unopposed, and received immediate orders of discharge. In the course of the proceedings it was stated that, although the London, Chatham, and Dover Railway Company suspended the prosecution of their claim of £6,000,000, they did not abandon their right to prove for that amount. The Commissioner, in granting the orders of discharge, expressed no opinion on the matters in dispute between the railway company and the bankrupts. The only observation he would make was that, although many long investigations had taken place, the bankrupts had had no opportunity of stating their version of the case in the slightest degree.

The Metropolitan Board of Works v. the Metropolitan Railway Company.—During the excavation for the defendants' railway near the Farringdon station, the Fleet sewer gave way and flooded the works. The question now raised for the court was whether the plaintiffs were entitled to compensation from the defendants for the damage done to the sewer. The Lord Chief Justice gave the judgment of himself and Mr. Justice Byles. The wall erected by the defendants would have been sufficient to support the adjoining soil, but not to support the sewer in the soil. It was not contended that the board had acquired any right of support from the adjoining land by length of user, because the sewer had been constructed within twenty years, but it was contended that such right to support was necessary for the works of the board, and that the right was to be implied from certain clauses in their Act of Parliament. It, however, could hardly be said that it was absolutely necessary that the board should have the right, because their Act gave them power to purchase any necessary rights in adjoining land; and if their right were to prevail, it would impose a very serious burden upon the owners of land adjoining to their works, who would not even be able to excavate for building purposes without incurring very serious responsibility. They were at a loss to discover any valid ground upon which the board could maintain an action of this sort; they did not think that any such right existed; and, therefore, there must be judgment for the defendants.—Mr. Justice Smith differed in opinion, he thinking that it was implied from the Act that gave power to construct the sewer that the board was entitled to support for that sewer from adjoining land. In his opinion, therefore, the plaintiffs were entitled to recover. —Judgment for the defendants.

A Paving Question.—On Tuesday, at the Clerkenwell Police-court, Mr. Henry Hill was summoned by the Local Board for the district of South Hornsey to show cause why he should not pay the apportioned amount of the expense payable by him as owner of the house, 14, Warwick-road, South Hornsey, as settled by the surveyor of the Local Board, for levelling, kerbing, and channelling, and making good the said road.—The defendant denied his liability.—Mr. Cooke, in delivering judgment, said: A notice to dispute was given, and it then became the duty of the Local Board to proceed by arbitration under the 123rd clause, 11th and 12th Vic., chap. 63, the amount being above £20, and the justices not having in such case jurisdiction until the arbitrator had determined the amount due; under the 123rd clause the amount could not be said to be disputed and due, and until that was ascertained, the six months' limitation did not begin to run. A document was produced before him by which the defendant agreed to the amounts due from him, subject to his liabilities upon other points, and he thought the effect of that document virtually was to withdraw his notice to dispute as to the amount claimed and the necessity for arbitration. He thought, therefore, from the date of that document the amount became definite and certain, and from that time the limitation of six months would begin to run within which the board must take proceedings. It followed, therefore, upon both points, that the board had a right to recover. Mr. Hill asked if the magistrate would grant him a case for the opinion of the Court above if he should require it.—Mr. Cooke said he would if it was applied for at the proper time. With regard to the question of costs, as they were not pressed for he should only order the defendant to pay the costs incurred by the complainant in taking out the summons.

Our Office Table.

A number of Welshmen have resolved to get up an exhibition of works of art at Ruthin, in Denbighshire. Ruthin has been fixed upon because the National "Eisteddfod" holds its annual meeting there this year, and the two "exhibitions" will be opened together, in the first week in August.

A munificent gift has been announced at a special meeting of the monthly board of the Huddersfield Infirmary. Mr. Chas. Brook, of Enderby Hall, formerly of Meltham, near Huddersfield, has offered to build and endow a convalescent hospital in connection with the infirmary, at a cost of £30,000. This handsome gift was, it need hardly be stated, most warmly accepted.

A few nights since, in the House of Commons, Mr. H. Major called attention to the danger that arises to life and property from the careless use of lucifer matches. In three years, he said, the Norwich Union Office had paid £13,600 for fires caused by lucifer matches, and on that basis the amount paid by all the insurance companies in the kingdom for fires caused by the careless use of lucifer matches was not less than £100,000 a year.

Tablets have been fixed in front of No. 16, Holles-street, and of No. 3A, King-street, St. James's-square, recording that Lord Byron once lived in the first-named house and the Emperor Napoleon III. in the second. Leave has been obtained to affix similar tablets in front of the former residences of Lord Nelson, Benjamin Franklin, James Barry, and other celebrated individuals, but the execution of the project has been delayed in consequence of certain experiments now making as to the best means of manufacturing the tablets required.

On Friday last six land engines and a large floating engine were engaged pumping water from the river to the length of the new Embankment roadway which runs in front of Somerset House. The object was to lay the loose dust and rubble some inches deep in water, so that they may be more readily solidified into something like a concrete road. After a day's soaking the steam rollers which have been recently used in Park-lane were set to work, and it is expected that the road will be levelled and made solid in a few more days.

An attempt is being made to establish a hospital in which diseases shall be treated without the aid of drugs or alcohol. The committee of the "Temperance Hygieon Hospital" wish first to test their system in some of the workhouse infirmaries, and a deputation from that body waited on Archbishop Manning on Saturday to ask his assistance to this end. The system has already been tried most successfully both in this country and in America. The archbishop said he considered the object the deputation had in view was highly satisfactory and commendable, and promised to give the committee all the aid in his power.

At the meeting of members and associates of the Royal Academy, which took place on Tuesday week, for the election of a member in the place of Baron Marochetti, deceased, Mr. Leighton was chosen by a large majority of votes. Mr. Frost was second in order. Mr. Leighton was elected A.R.A. in July, 1864.

The Italian sculptor Giovanni Bastianni has just died at Florence of typhus fever, at the age of thirty-eight. His name became celebrated in a brief space of time in consequence of the famous bust made by him in terra cotta of Benivieni, which was bought for a small sum by a Florence antiquary, and then sold for 13,000 francs at a sale by auction in Paris, and is at present placed in the Louvre. The authenticity of this bust is still disputed.

On Tuesday night Mr. Cowper asked the First Commissioner of Works when the public would be admitted to see the frescoes painted by the late Mr. Dyce in the Queen's robing room. Lord J. Manners said the frescoes could now be inspected by the public, and they would be deemed worthy of the great artist who painted them. Some arrangements as to the means of access had to be made, after which the room would be open to the public.

Some alarm has been created in the minds of Hyde Park *habitues* by the destruction of so many fine trees in the neighbourhood of the Albert Memorial, with the view probably of affording a better view of the monument. In answer to Mr. Beaumont, on Monday night, in the House of Commons, Lord J. Manners said that no more trees would be cut down this year, but he could give no other information as to what was intended to be done generally with that quarter of the park, except that next year there would be a vote for "relaying and reforming" the groundwork of the memorial.

The *Athenæum* states that the tomb of the poet Thomas Moore, who died in 1852, and was interred in the churchyard of Bramham, in Wiltshire, is in a very bad condition. It is not creditable to us that the resting place of the author of "Lalla Rookh" should pass into oblivion; and perhaps attention being drawn to the present condition of his grave may lead to its being put into an efficient state of repair.

An examination of persons desirous of obtaining a certificate of competency to perform the duties of district surveyor will take place at the rooms of the Institute of Architects, Conduit-street, on Thursday, the 30th, and Friday, the 31st inst., at ten o'clock a.m. Persons wishing to be examined must send an application to the secretary on or before the 23rd instant.

Mr. Alderman Lusk, in offering some remarks on the insufficient accommodation of the British Museum on Tuesday last, quoted, with apparent approval, a friend's remarks concerning the Elgin marbles, that they were "big stones and men without heads, and he did not think much of them."

Mr. Holmes, the archæologist attached to the Abyssinian expedition, has obtained a large quantity of Ethiopian manuscripts, the value of which remains to be ascertained, but which, it is hoped, may contain something worth having, as the Book of Jasher was in 1820 recovered from Abyssinia. Mr. Holmes bought Theodore's crown and a chalice for £4, and the Government, it seems, now propose that the British Museum should buy back their own collection for £2,000.

We have great pleasure in recording the handsome donation, by the Queen, of £500 towards the funds of the Incorporated Church Building Society.

At the corner of Gray's Inn-lane, where Middle-row formerly stood, a cast-iron fluted pillar, supporting four lanterns and a fifth central one, has been erected by the Metropolitan Board.

In consequence of dissatisfaction with the tenders for dusting and scavengering, the vestry of Bethnal Green have referred it to a committee to see whether they cannot perform the work themselves without contracting.

From a paper laid before the House of Commons' arrangement committee by Mr. Barry, it appears that among the chambers of four great capital cities—Paris, Berlin, Florence, and Washington—our House of Commons stands pre-eminent for the poverty of its accommodation. It is the shortest and the narrowest House, it has fewer cubical feet of space, and consequently of air, than any other of its fellows. Paris allows to a total number of 712 seats in her Corps Legislatif 277,000 cubic feet of space; London, to 691 seats, 127,000ft. only. Washington gives to 1,312 seats 400,000 cubic feet. Florence, more liberal, allots 467,000ft. to sitting room for 944 persons.

The Select Committee which was appointed some months ago to consider what alterations could be made in the arrangements of the House of Commons, have issued their report. It is acknowledged that the existing chamber is defective in the necessary extent of accommodation, and it is therefore proposed to construct a new house on the space now occupied by the Commons court and the dining-rooms. The new building would seat 141 more members, twelve more peers, fourteen more ladies, and sixty-seven more strangers than have hitherto been accommodated in the lower house. Mr. Barry's estimate of the expense is £120,000.

The Metropolitan Board of Works are seeking powers to compel railway companies to adopt some means of deadening the sound of railway bridges crossing the public streets, and we hope they will succeed.

A correspondent says:—"When the main drainage scheme of Mr. Bazalgette shall have been completed, the proper disposal of the house sewage will still have to be provided for, and the storm waters will still remain to be effectually disposed of or got rid of."

The St. Pancras Guardians at their last meeting selected Mr. S. Finney from among a number of other candidates to be resident engineer and clerk of the works at the new district school at Leavesden, Woodside, about to be commenced. He is to receive the handsome salary of £300 a-year, with house, coal, and gas.

A new kind of pasteboard roofing intended to supersede slate has been submitted to the inspection of the Emperor Napoleon. The invention is stated to be a coarse kind of cardboard highly impregnated with mineral substances, impermeable to damp and rain, and quite incombustible.

The thirty-fifth biennial meeting of the London Association of Foremen Engineers took place on Saturday; Mr. Joseph Newton in the chair. From the report and balance-sheet it appears that the association now numbers rather more than 150 ordinary and honorary members, composed mainly of foremen and employers of the engineering trade. The general fund of the society amounts to £13 2s., the superannuation fund to £903 18s., and the widows and orphans' fund to £12 4s., making a total of £1,347 4s.

Amongst the many metropolitan societies which have a special regard for the welfare of the poor, is that for promoting window gardening among the working classes in the united parishes of St. Margaret and St. John, Westminster. It has for its patrons the Very Rev. the Dean of Westminster, the leading clergymen of the district, and the Right Hon. Lord Justice Wood. The annual "show" took place on Wednesday afternoon, in the Dean's yard. Prizes were offered in three classes—the first being open for competition to working men and women; second, domestic servants; and third, children in parochial, national, infant, Sunday, and ragged schools. The pleasantest part of the meeting was the enjoyment which the poorer people and a large number of children obtained by being allowed to use the ground in the most unrestricted manner. In the evening the prizes were distributed by the Earl of Shaftesbury.

The Council of the Institution of Civil Engineers have just awarded the following premiums for original communications submitted to the institution, and read at the ordinary meetings during the session 1867-68:—1. A Telford medal and a Telford premium of books to George Higgin, M. Inst. C.E., for his paper "Irrigation in Spain, chiefly in reference to the Construction of the Henares and Esla Canals, in that country." 2. A Telford medal and a Telford premium of books to Christer Peter Sandberg, Assoc. Inst. C.E., for his paper "On the Manufacture and Wear of Rails." 3. A Telford medal and a Telford premium of books to Lieutenant-Colonel Peter Pierce Lyons O'Connell, R.E., Assoc. Inst. C.E., for his paper, "On the Relation of the Fresh Water Floods of Rivers to the Areas and Physical Features of their Basins." 4. A Telford medal and a Telford premium of books to William Wilson, M. Inst. C.E., for his paper "Description of the Victoria Bridge, on the Line of the Victoria Station and Pimlico Railway. 5. A Telford medal and a Telford premium of books to Charles Douglas Fox, M. Inst. C.E., for his paper "On New Railways at Battersea, with the Widening of the Victoria Bridge, and approaches to the Victoria Station." 6. A Telford medal and a Telford premium of books to John Wolfe Barry, M. Inst. C.E., for his paper "On the City Terminus Extension of the Charing-cross Railway." 7. A Watt medal to Edwin Clark, M. Inst. C.E., for his paper "On Engineering Philosophy; the Strength of Materials." 8. A Telford medal to William Jarvis M'Alpine, M. Inst. C.E., for his paper "On the Supporting Power of Piles; and on the Pneumatic Process for sinking Iron Columns, as practised in America." 9. A Telford premium of books to Thomas Login, M. Inst. C.E., for his paper "On the Benefits of Irrigation in India; and on the proper Construction of Irrigating Canals." 10. A Telford premium of books to Allan Wilson, M. Inst. C.E., for his paper on Irrigation in India." 11. A Telford premium of books to Wilfrid Airy, Assoc. Inst. C.E., for his paper "On the Experimental Determination of the Strains in the Suspension Ties of a Bow-string Girder." 12. The Manby premium of books to Andrew Cassels Howden, Assoc. Inst. C.E., for his paper "On Floods in the Nerbudda Valley, with Remarks on Monsoon Floods in India generally."

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

3523 G. A. YOUNG. AN IMPROVED CURTAIN OR SCREEN FOR SEPARATING THE STAGE FROM THE AUDIENCE PART IN THEATRES AND MUSIC-HALLS, IN ORDER TO PREVENT THE SPREADING OF FIRE, ALSO APPLICABLE TO OTHER BUILDINGS WHERE IT IS DESIRED TO PREVENT THE SPREADING OF FIRE FROM ONE PART OF THE BUILDING TO ANOTHER. Dated December 12, 1867.

This invention consists in constructing a curtain or screen of wire gauze with fine meshes, which is by preference fitted on a roller, so as to be rolled up and unrolled as ordinary blinds or stage curtains. The above is one method described in the specification, but other arrangements are also set forth.—Patent completed.

3542 E. R SINTZENICH. A NEW OR IMPROVED TREATMENT OF GUTTA-PERCHA, INDIA-RUBBER, HONDURAS GUM, AND THE OTHER ALLIED GUMS, FOR THE PRODUCTION OF A PREPARATION APPLICABLE AS A VARNISH, CEMENT, PAINT, &c. (A communication) Dated December 13, 1867.

This invention consists in dissolving such gums in benzine or benzole, or its chemical equivalents, and in adding alcohol in sufficient quantity, in separating the purer portions of the gum from the barky, resinous, and other foreign substances, the gum rising and collecting in the form of a curd more or less solid (by the action of the alcohol). This curd is to be re dissolved thoroughly in benzine or benzole to any consistency for the finer use or uses to which it may be desired to apply it.—Patent abandoned.

3550 J. G SETTLES. IMPROVEMENTS IN DOOR BOLTS AND INDICATORS. Dated December 13, 1867.

The patentee claims combining a door bolt and indicator (as described) so as to indicate on the outer side of the door whether the bolt within is shot or otherwise. He also claims the general arrangement of the apparatus described. The details of the invention are too voluminous to be quoted here.—Patent completed.

Trade News.

TENDERS.

The Chelsea Vestry have accepted the tender of Messrs. Brown and Smith for painting the exterior of the Vestry-hall, and other works, for £62.

LANGTON AND ELDENSFIELD DRAINAGE, Mr. T. Curley, Hereford, engineer.—The tender of Mr. William Field, of Shrewsbury, for £51 13s 2d. has been accepted. Mr. Thomas Brassey, Westminster, surety.

BEDFORDSHIRE.—For the erection of Sandy national schools, Bedfordshire. W. G. Habershon and Pite, architects:—

Cowland	£1990
Pattinsons	1900
Carter and Son	1870
Canvin	1737
Twelvetrees	1678
Field	1595

BURSLEM.—For the erection of canal wharf shed for the North Staffordshire Railway Company. Mr. J. S. Forbes, canal engineer, Stoke-on-Trent:—

Bennett and Cooke	£1200 0 0
Wooldridge	1087 0 0
Blackhurst	1086 10 0
Brindley and Critchlow	1085 8 6
Bowden	889 0 0

COVENTRY.—For alterations and additions to the old Coventry and Warwickshire Hospital. Mr. George Steane, architect:—

Brown	£2640
Matthews	2337
Dutton	2325
Worwood	2315
Webb	2307
Barnsley and Sons	2208
Marriott	2220
Lovatt	2100
Makepeace	2090
Woof	2062
Hallam and Co. (accepted)	1953

GROVE HALL.—For additions to Grove Hall lunatic asylum. Messrs. Tolley and Dale, architects:—

Fawcett	£2449
Rivett	1873
Perry and Co.	1707
Pritchard	1697
Abraham	1696
Hill, Keddall, and Waldrum	1668
Hedges (accepted)	1596

HURSTPIERPOINT. — For erecting national schools at Hurstpierpoint, Sussex. Messrs. Goulty and Gibbins, architects. Quantities supplied by J. C. Lansdown, surveyor:—

Stanbridge, Lindfield	£2269
Lockyer, Brighton	2105
Chappell, Steyning	2075
Cheeseman and Co., Brighton	2070
Howell, Hastings	2058
Kirk, London	1970
Nash and Co., Brighton	1962
Nightingale, London	1883
Hall and Co., Brighton	1870
Holland, Hurstpierpoint (accepted)	1867
Thos Wadey, Hurstpierpoint	1643

LLANSAMLET.—For erecting a schoolroom and house at Maesybyar, Llansamlet. H. Francis Clarke, architect:—

	School.	House.
John Michael	£308 9 10	£158 8 0
Rees Roderick	304 0 0	183 0 0
Thomas Ley	286 0 0	233 0 0
Rees Llewellyn	282 0 0	235 0 0
John Rogers (accepted)	310 10 0	200 10 0
Isaac George	—	166 10 0

LONDON.—For alterations and additions to No. 240, Blackfriars road. Mr. George Perry, architect:—

Patman and Co.	£1225
Axford	1175
Gadsby	1015
Bishop	993
Bamford	970
Langmead and Way	970
Macey (accepted)	949

LONDON.—For alterations and additions to No. 19, Great Windmill street, for Mrs. Kemp. Messrs. Glazier and Son, surveyors:—

Corbet	£256
Nightingale	227
Batchelor	177

LONDON.—For alterations and repairs to the Rodney Tavern, Westminster Bridge road. Messrs. Bird and Walters, architects:—

Nixon and Son	£1240
Williams and Son	1245
Ebbs and Sons	1243
M'Lachlan	1209
E. Brown	1188
Newman and Manns	1175
Kelly Brothers (accepted)	1153

MUCKING.—For alterations and additions to the vicarage house, Mucking, Essex. Mr. Charles Innes, architect, 6, Whitehall:—

Carter and Sons	£949
Place	895
Rivett	893
Blake	795
Davey	769
Lilleystone	730

This List will be rapidly added to, and it is believed that the Museum of Building Appliances is capable of almost indefinite extension. Exhibitors are urged to record the fullest information, and no trouble will be spared to procure for architects, *gratuitously*, any further information which may not already be recorded upon the books of the Museum. Architects and their clients are solicited to choose from the Specimen Works exhibited, and orders will be received for transmission to the exhibitors if desired. All applications to be made to THE CURATOR.

THE MUSEUM OF BUILDING APPLIANCES,
23, MADDOX STREET, HANOVER SQUARE, LONDON, W.

CONTRACTS.

TO BUILDERS and MATERIAL DEALERS.—TENDERS are required for the PURCHASE of the whole of the MATERIALS, except bricks and rubble walling stone, forming the old Guildhall and Prison at Grantham. The bricks and rubble stone are to be pulled down and cleaned and stacked on the premises. Further particulars and forms of tender to be had of the undersigned. Tenders to be sent in on or before July 24, The lowest or any tender will not necessarily be accepted.

WILLIAM THOMPSON,
11, Elmer street, Grantham.
WILLIAM EVE,
10, Union-court, Old Broad-street, London, E.C.

TO BUILDERS.—TENDERS are required for the ERECTION of a DETACHED VILLA RESIDENCE in the Linkfield-lane, Redhill, Surrey. Plans may be seen at the office of the architects, Messrs. Rees and Son, at Redhill, any day from ten to five, where bills of quantities may be obtained. Sealed tenders are to be delivered at the said office on or before Friday, July 17, by five o'clock. The lowest or any tender not necessarily accepted.

TO ROAD MAKERS.—TENDERS are required for CONSTRUCTING about 1,000ft. of ROAD to a building estate on Sutton Common-road, Sutton, Surrey. Contractors wishing to tender are requested to leave their names with the surveyor, Mr. Robert Walker, 10A, King's Arms-yard, Moorgate-street, on and after Tuesday, July 14, when copies of the quantities can be obtained on payment of 7s. 6d. The lowest nor any tender will not necessarily be accepted. The tenders will be opened on Tuesday, July 21.

TO RAILWAY TUNNEL CONTRACTORS.—Railway Tunnel Contractors, desirous of TENDERING for the COMPLETION of a TUNNEL abroad, about four miles in length, may have particulars by applying to M. Abrahams, Esq., solicitor, 8, Old Jewry.

DWELLINGS FOR WORKING PEOPLE.

THE SOCIETY for IMPROVING the CONDITION of the LABOURING CLASSE: have just published, at their office 24, Exeter Hall, Strand, a Revised and greatly Enlarged Edition (sixth thousand) of

The DWELLINGS of the LABOURING CLASSES: their Arrangement and Construction; to which is now added, The Essentials of a Healthy Dwelling, and a historical sketch of the efforts made for extending its benefits to the working population, particularly in the metropolis, and likewise on the continent. With numerous Illustrative Plans of existing Model Houses, those of the late Prince Consort and the Royal Windsor Society, as well as Designs adapted to Towns and to Rural Districts. By HENRY ROBERTS, Esq., F.S.A. Price 7s cloth.

Also, by the same Author,
New and Revised Editions of
HOME REFORM: or, What the Labouring Classes may do to Improve their Dwellings. An Address to Working People. Price 3d.
The PHYSICAL CONDITION of the LABOURING CLASSES, Resulting from the State of their Dwellings, and the Beneficial Effects of Sanitary Improvements adopted in England. Price 2d.
WORKING DRAWINGS, on a large scale, for Labourers' Cottages. Each design, complete on one sheet, price 2s.; specification for ditto, 1s; bills of quantities, 1s. 6d.

TO ARCHITECTS, ART-DECORATORS, and FURNITURE DEALERS.—An Architect of London practice, about publishing a work on art furniture and having several of the proposed designs successfully executed, WISHES to MEET with a MAN of CAPITAL, willing to co-operate with him in starting a business.—Address (D.), Cole and Williamson, Charles-street, King-street, S.W.

ARTISTIC BOOKS LOW PRICED.—Clearance Catalogue (gratis) of rare works of the galleries, drawings, etchings, costume, portraits, heraldry, pageants, architecture, ornament, emblems, early woodcuts, views, artistic anatomy, &c., prior to further extensive alterations.—Edwin Parsons, 45, Brompton-road. Just issued.

CONCRETE BUILDINGS.—Those desiring to avail themselves by the construction of this superior and inexpensive material for walls, by the use of MR. J. TALL'S PATENT APPARATUS, can be provided with Plans and Estimates by MR. PETER THOMSON, 24, High-street, Manchester-square, Marylebone, of whom may be had, on the receipt of 14 stamps, "Improved Dwellings for the Low Paid Worker," 4to. illustrated; "Healthy Moral Homes for Agricultural Labourers," 8vo, 30 plates, for 64 stamps; and "English Cottages for Artisans and Labourers," royal 4to, 30 plates, on receipt of P.O.O. for £1 1s., payable Thayer street.

COLLING'S ART FOLIAGE, for Sculpture and Decoration, royal 4to, 72 plates, with letterpress and numerous woodcuts, price 36s., or 30s. when ordered direct from the Author. London, published by the Author, 150, Hampstead road, N.W.

BUILDING GROUND.—Several PLOTS to be LET for Seven roomed houses, situated in Evershot road, Tollington Park; also ground for a Public and seven other houses. Bricks and money advanced.—Apply to Mr. C. Marnott, Marnott-road, Tollington Park, Holloway.

BUILDING LAND to be LET, close to Barnes Railway Station.—For particulars apply to Mr. Wood, 67, Hop Exchange, Southwark-street, S.E.

EUSTON-ROAD, near the Hampstead-road.—Valuable BUILDING LAND, with a frontage of 115ft., and area of upwards of 13,800 square feet to be LET on Building Leases in one or two plots.—Apply to Finch, Hill, and Parnare, architects, 442, Oxford-street, W.C.

TO CONTRACTORS, BUILDERS, and Others REQUIRING ROOMY PREMISES.—To be LET, with immediate possession, several light WORK-SHOPS, Counting House, Plumbers' and Painters' Shops, stabling, Coach-house, Stage for Stowage of Deals, &c. Also, if required, Saw-mill Machinery, situated within a few minutes' walk of the Bank.—For further particulars, apply at the City Timber Yard, 20, Long-lane, E.C.

PARTNERSHIP.—A Gentleman, who is the Inventor of a Process for the Manufacture of a Material of great beauty, and capable of extensive application in the architectural decoration of buildings, and who is practically acquainted with its application, desires to MEET with a GENTLEMAN possessed of £2,000, to develope the business in London and Paris.—Address, R. T., care of Messrs. Street Brothers, 5, Serle-street, London, W.C.

WANTED, to SELL on COMMISSION, MARBLE SCULPTURE (works of merit preferred), by a party just opening premises. Best thoroughfare in Manchester.—Address, J. H., 116, Portland-street, Manchester.

FOR SALE.—1½ tons of second quality WHITE LEAD, £14 per ton.—Particulars and sample at 10, Huron-street, Lorrimore-road, Walworth, S

UNDER THE PATRONAGE OF H.M. THE QUEEN.

THE LONDON PARQUETRY WORKS, —The first Establishment founded in England (in 1842) for the exclusive manufacture of Solid and Plated PARQUET FLOORS and BORDERS, CEILINGS, and WALL DECORATIONS; and Sole Patentees of the only system adapted to the English climate, whereby the evils of DRY ROT, SHRINKAGE, and WARPING (so common to work manufactured in foreign climates), are EFFECUALLY PREVENTED.—For designs, estimates, and list of nearly 300 floors, &c., apply to THE LONDON PARQUETRY WORKS, Grove-lane, Camberwell, S.; or to their Sole Agents, Messrs. Gillow and Co., 176, Oxford-street.

C. H. DAVIES and CO.'S
GENUINE AND ARTISTIC
SOLID PARQUET FLOORS
N.B.—Designers and Practical Joiners.
CAMBRIDGE HALL, NEWMAN STREET
LONDON.

JOURNEYMEN CARVERS' TRADE SOCIETY.—EMPLOYERS and the Trade are respectfully informed that the above society MEET every MONDAY EVENING at the Adam's Arms, Hampstead street, Fitzroy-square. N.B.—The Unemployed List can be seen at any hour during the day.

MORTGAGES. — MESSRS. HENRY SALTER and CO effect Mortgages on Landed Estates and House Property to any extent, and where estates are being laid out for building they undertake the needful arrangements for advances and permanent mortgages throughout.—11, Pancras lane London, E.C.

TO BUILDERS.—MONEY ADVANCED as the work proceeds by the BUILDERS and GENERAL ADVANCE ASSOCIATION (Limited.)—Particulars and forms of application may be obtained of the Secretary.—Offices, 110, Cannon-street.

TO BUILDERS, &c.—Combined machine for Sawing, Mortising, Tenoning, Rabetting, Grooving, and Boring, worked by manual or steam power, £17. Write for prospectus, and see testimonials from some of the largest firms in London.—Marshall, Patentee, Union Steam Works, Union-street, Whitechapel, E.

LAMP-POSTS—Plain and Ornamental.
DWARF GAS PILLARS, ditto ditto.
LAMP BRACKETS, ditto ditto
LAMPS, in Cr., per Tin, Iron, and Brass.
NUMBERS for STREET-LAMPS, newly invented,
FOUNTAINS—Garden and Drinking.
GATES RAILINGS, &c., &c.
VASES for GARDENS, TERRACES, & &c.
A Book of the newest DESIGNS for these will be forwarded free on receipt of 3s. 6d. in stamps, which will be allowed on first order
TURNER and ALLEN, Founders and Contractors
201, UPPER THAMES STREET LONDON.

GOUT and RHEUMATISM.—The excruciating pain of Gout or Rheumatism is quickly relieved and cured in a few days by that celebrated medicine, BLAIR'S GOUT and RHEUMATIC PILLS.

They require no restraint of diet or confinement during their use and are certain to prevent the disease attacking any vital part.

Sold by all Medicine Vendors, at 1s. 1½d. and 2s. 9d. per box or obtained through any Chemist.

THE BUILDING NEWS.

LONDON, FRIDAY, JULY 17, 1868.

THE NEW FOREIGN OFFICE.

THIS building, as is generally known, was handed over to the Government Department of Works on the 17th of June. It is to be regretted that no opportunity has hitherto been offered the public for viewing the interior and assuring themselves that the whistle for which they have paid is not dear at the money. It must be borne in mind that the Foreign Office is something more than a public office. It is the place where Her Majesty's principal Secretary of State for Foreign Affairs holds his official receptions, where councils are held, treaties made, and where the great ones of all nations will at times assemble. In what may be termed the State apartments of such a building no amount of magnificence is out of place and no expense should be spared. With the exterior of the building the public have for some time been familiar; it is our present object to give a description of the decoration of the interior. Entering from Downing-street through gates of most elegant design, the visitor finds himself in what Dr. Johnson was pleased to call "outward rooms" devoted to the hall porter and "posts with packets." Exit thence is made by ascending a short flight of very badly lighted steps, and the grand staircase hall, ablaze with light and colour, is reached. Here the decoration of the building may be said to commence. In describing this building, or rather this portion of the huge structure which, when complete, will embrace the Home, Foreign, Colonial, and Indian departments, it may be as well to state that it surrounds a quadrangle at the north-western corner of the main block. The coloured decoration is confined to the principal or State apartments, but an air of solidity and truly national character pervades every portion of the structure. The State apartments occupy two sides of the quadrangle, the staircase occupies the third, and the corridor of communication the fourth. We are now in the staircase hall on the ground floor. This is beyond doubt the most imposing feature in the building. A noble staircase, branching right and left, panelled with the choicest marbles, well lighted, and rich in all the adjuncts of colour, can, for scenic effect, be with difficulty matched. The marbles which, without exception, are British, are splendid specimens, ranging from black to dove-colour. The black Derbyshire is used in the form of a string decorated with a Grecian honeysuckle pattern in gold. The balusters are of alabaster, and the rail of dove-coloured marble, the effect being, with one exception, harmonious. There are two columns of polished red granite supporting the corridor above; these ruin the effect. Polished red granite is, at the best of times, a risky element of colour, and mixed up with marble is disastrous. The architect, Mr. Gilbert Scott, seems to have realised the fact that it is impossible to fall over a staircase on the side next the wall, and therefore provided a balustrade on the outer side only. It may be remembered that the staircase of Dorchester House, costly as it was, is simply ridiculous from having a balustrade on each hand—for symmetry forsooth! Ascending these stairs a noble corridor is reached, communicating on the one hand with the rooms of the principal secretary and private secretaries, and on the other leading directly into the principal council chamber, or conference room as it is named. From this corridor, or from any part of the staircase, a good view is obtained of the ceiling of the staircase hall. This ceiling is vaulted and domed, the cupola being ornamented with female figures draped in white on a gold ground, and representing various nations. Signs of the zodiac, inscriptions, heraldic devices, &c., are introduced, the general effect of which—and the remark applies to the whole of the coloured decoration throughout the building—may be described by the word "delicate." It may, perhaps, be questioned whether a little more colour might not have been introduced with advantage. There is a trifle too much gilding, and some may object to the *gala* air which pervades the decoration, but of the taste displayed there can be no question. If a building is to be devoted to two purposes, business and pleasure, things at all times hard to reconcile, it is impossible to choose a line of decoration at once grave and jocund. Where the conference room does duty for a ball-room, the cabinet for a banquetting hall, and the smaller conference room for a drawing-room, the man must be indeed gifted who can hit upon a style of decoration suited to such diverse conditions. The attempt has, however, been made, and the result is as satisfactory as could be expected. Passing along the corridor, with its splendid columns of Devonshire marble, with gilded capitals and bases, we reach the apartment of the principal secretary. Sage green and gold are the colours used on the walls, with a black bordering. The ceiling is coffered in octagons, pale green and gold. The effect is good, light without being gay. Farther on are the rooms of the private secretaries, and at the end of the corridor the cabinet is reached. This is a noble room, used also as a dining-room. The walls are of an amber colour, and the ceiling is tinted in white and blue. In our opinion, there is an excess of white and blue, and we would willingly have seen a little red or even olive green. Opening into this room is the smaller conference room, which does duty as a drawing-room, and here the efforts of the artists have been most successful. The walls are of a sage green, relieved with delicate devices in gold, and the ceiling is decorated with gold, red, and green. From this room the principal conference-room is approached, a noble apartment, 66ft. in length, 33ft. in breadth, and 45ft. in height. The ceiling is wagon-headed, coloured turquoise blue, powdered with stars, and decorated with medallions. The walls are of a well-chosen salmon colour, decorated with exquisite Grecian devices in Indian red and gold. For a ball-room the decoration is appropriate, though for a council chamber the gilding is excessive, and the use of Corinthian capitals or *quasi* capitals as corbels is to the last degree unwarrantable. The frieze is somewhat coarse, having a gilt running ornament on a red ground. The friezes throughout the building are very similar, the ornament being the unmeaning Roman pattern which the late Mr. Pugin termed "in and out Sheffield eternal." There is so much that is excellent in the general decoration that it is to be regretted a single fault should be found in it. The dark colours in the dados are correct, the blues, whites, and gold in the ceilings are unobjectionable, but it cannot be maintained that dark red—Indian red, in short—in mass is fit colour for a broad continuous band such as a frieze, more especially when the wall lacks strong colour to lead up to it. Of the general devices of the coloured decoration it is impossible to speak too highly. Designed in the Grecian spirit by earnest students of the decorative art of all nations the ornamentation of the Foreign Office will long be pointed to as an example of the state of the art in England in the middle of the present century. That it is perfect, or that it will please all, would be saying more than is our wont; but that it will always give pleasure to the cultivated mind and educated eye we are certain. On quitting the grand conference room we again enter a corridor having made a complete circuit of the quadrangle, and, descending the staircase find ourselves passing through the dark lobby after a visit to the MS. library, and so into the courtyard or into Downing-street, as pleases us. In all criticism on the coloured decoration of this building it must be borne in mind that everything is designed for the night effect, when artificial light will be used. It is therefore impossible to do complete justice without seeing the rooms under those conditions. If they have as good an appearance by night as they have by day there is little with which the most captious could find fault. The mantelpieces are for the most part ancient, having at one time belonged to the old Palace of Whitehall. They are of great beauty, and harmonise well with the architecture and decorations. The metal-work, such as grates, fenders, sconces, and chandeliers, are of very elegant design. In these rooms a peculiarity will be observed. Owing to the necessity for fireproof construction iron girders have been freely used, and in all cases they form a visible portion of the ceiling. A girder of wrought iron is at no time an architectural object. In the present instance they have been rendered as little offensive to the sight as possible. Coloured, gilded, plated with majolica ornament of good design and well-chosen colour, the wrought-iron girder asserts itself in an unmistakable manner. There is no doubt that it is a thing for ever, but it is never a thing of beauty. It has hitherto defied treatment, and will continue to do so as long as we build our walls perpendicular and lay our floors horizontal. It would seem that all the resources of art have been lavished on these girders, and they are really pretty, but the building is not pretty. There are few structures above the pretension of a marquee at an archery meeting to which the application of the term "pretty" would be complimentary. The Foreign Office, inside or out, may be grand and imposing, or petty and weak, but it cannot descend to the depth of prettiness. The decorations are by Messrs. Clayton and Bell; the metal-work by Mr. Skidmore; the majolica ware by Minton.

ON THE SESSIONAL PAPERS OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS—1867-8.

THOSE of our readers who are not members of the Royal Institute of British Architects are probably hardly aware that the papers read at the ordinary general meetings throughout the session are not only issued with commendable despatch in the form of a pamphlet so as to be in the hands of all the members within a few days after they have been read, but that, collected in the shape of a goodly volume at the close of the session, they are offered to the public as well at a moderate price. These papers are often profusely illustrated, and during the past year even more liberally than on former occasions, a boon which must be particularly appreciated by those members who reside in the provinces. Such a description, for instance, as that given by Mr. W. B. Scott, of the mural decorations executed by him at Wallington, would have been simply unintelligible to those who were prevented attending when he exhibited the paintings themselves had it not been for the complete manner in which they are rendered in the illustrations. Thus a general section of the hall for which they were designed is given, as well as the whole of the eighteen spandrels representing the old Border ballad of Chevy Chase. With regard to these there may fairly be difference of opinion as to whether they are sufficiently architectural in their character, and we have already criticised them from that point of view; but with regard to the completeness of the manner in which the scheme and work of the artist have been set forth in this volume there can be no question. The illustrations are absolutely his own handiwork, being translated by a new process invented by Mr. C. Hancock, by means of which they are reduced by photo-

graphy on to copper from pen and ink drawings. The process, like all new ones, is probably capable of great improvement. At present greater care seems to be requisite on the part of the printer than is needed in the case of woodcuts, together with some experience on the part of the artist, but it may be stated with certainty that the expense of any other method hitherto employed would have precluded the appearance of these illustrations at all.

This series of papers is fitly commenced by a memoir of the late Charles Fowler, one of the founders of the Institute, who had died during the recess. This is from the able and prolific pen of his comrade, Professor Donaldson. It is written in an affectionate and apologetic spirit, for the honesty of the biographer forbade his claiming for his old friend any very high niche in the Temple of Fame. Fate had been somewhat unpropitious to him, for his most important work, Hungerford Market, has been but lately swept away; that of Covent Garden, however, and some other similar buildings of his remain, of which the most that can be said is that they are simple, practical, and inoffensive. Lithographic views of the interior of Hungerford Market, and of the exterior of that at Exeter, accompany this paper, and will help to preserve the memory of a good if not of a great man.

With the next paper we confess to being disappointed. It is that by Professor D. T. Ansted, on "The Relation of Geology with Architecture," a somewhat slight handling of a grave subject. The origin of constructive materials, somewhat to the astonishment of the Hon. Sec. for Foreign Correspondence, is laid down as having been almost universally from deposition in water. Their several varieties, such as limestones, sandstones, granites, marbles, and slates, are rapidly sketched, and those in general use are referred to in their proper classification, and the method of their formation, according to the latest theories, is pointed out. The process of decay in weathering is explained, and some nostrums for its prevention are noticed, and cements are spoken of as being within the province of architectural geology. The Professor concludes with the assumption that architects, as using such substances on a large scale, desire to learn as much as possible of their history and nature to enable them to look for them in the right place, to use them in the right way, and to manipulate them properly and economically. The assumption is perfectly correct, but hardly needed so long a preamble to prove it. Architects are well aware of the importance of the subjects of its manifold branches, as was shown by many pertinent questions put by several members in the course of the discussion; such as, "Which are the stones that may best be relied upon to resist the atmosphere of London?" "Which have the strongest fire-resisting qualities?" "What green and grey slates can be relied upon?" These and other questions elicited some valuable replies from Professor Ansted, but as far as it has yet been carried by this paper and the discussion thereon, it has been but opened, and needs far more minute and careful consideration.

The very high importance which should be attached to attempts to introduce a better style of mural decoration is quite sufficient excuse for the opportunity afforded to Mr. W. B. Scott by the Institute, to explain those he has executed at the mansion of Sir Walter Trevelyan, at Wallington, and those at Pentill Castle, in Ayrshire. But with very high merit as paintings, they are unquestionably in error as mural decorations. They ignore the architectural forms to which they should be subservient; they turn solid spandrels into aerial spaces of mist, sunshine, and shade; their perspective sets the flatness of the wall in defiance, and the composition, ingenious as it is, is misapplied. Mr. Scott has lately had the opportunity of seeing some of these paintings placed in the same gallery with the beautiful drawings for the decoration of a church, by Mons. Lameire, and we trust that he has learnt by the contrast the principles which ought to be respected in such matters, not but that Mons. Lameire himself might carry them a little further than he has done, and give up the seductions of shading his mantles. It is strange that we should have to be propounding as novel truths what every old Byzantine or mediæval painter acknowledged by intuition; and if our own decorators would but study the old screens in Norfolk, we should be spared having thus to criticise their works.

Mr. Seddon, taking as his text the photographs of the Architectural Photographic Society for the year 1867, describes the difficulties encountered in obtaining them after the selection of the route—itself no easy matter, it would appear, from a racy letter on the subject, by Mr. Aitcheson, which is quoted in the paper. In spite of difficulties, however, some fine photographs were secured, such as the exterior and interior of Limburg Cathedral, which we have since engraved in this journal. Some short notes upon each building visited are accompanied by plans and sketches, which greatly aid the reader in grasping the necessary technicalities in such descriptions. The country thus explored is that of the Lower Rhine, the Lahn, and the Mosselle; but in a later paper, by Mr. H. W. Brewer, ably illustrated by sketches by that artist, the subject is taken up, and continued into Central and Southern Germany—particularly to the cities of Würzburg, Bamberg, and Ratisbon, and their neighbouring towns and villages—in a manner which, if we mistake not, will lead many a student to follow in the route suggested, full, as it must be, from his description, of objects of art, and rich in natural beauties.

We are led still further eastward in reading the paper by Mr. Edward l'Anson "On the Kremlin of Moscow," a region less richly endowed with art or architecture, but which boasts the greater interest of being comparatively unknown. We suspect that a more intimate acquaintance would leave it rather destitute of charms to the architect, and the rather naively confessed inability of the author to describe the style of its buildings would lead us to think that they hardly deserve any such classification. Still the multiplicity of towers and domes, and pinnacles, like half a dozen bluebottles with a bodkin run through them, glistening in green and gold, is a sight not sufficiently common to be contemplated without interest by the most rigid purist. The rich iconostasis which is the feature of all the interior of the churches must be exceedingly suggestive, although all the gold and jewels which excite our marvel in the description must fail to render it a work of art; and we read of these with much the same feeling as that with which we listen to the inventory of the vergers who describe the cornelians and opals, with an eruption of which the reredoses of our own cathedrals and churches have of late been so sorely afflicted.

In the description of the "Proposed School of Art at Bombay," by Mr. W. Burges, we have what we are most thankful for as an instalment of what should be the principal feature in the transactions of the Institute; we mean notices of the works of the members. This one is the more interesting as, having been designed for a distant country, we are never likely to see the structure itself, if it should be erected, which now seems to be doubtful. The requirements of the building were peculiar, and to meet them very great ingenuity was called for. This demand was well responded to, and every provision seems to have been made to exclude the heat of the climate, and to admit the air freely. The plan is simple and well-arranged, in the shape of the letter E, having projecting wings and a staircase tower, which is made the feature of the design in the centre; between them there are open corridors on each side of the building, and from the back projects from the centre a low building, leading to what Mr. Burges calls "a circular domed building, somewhat in the shape of a mediæval kitchen." We should say it was very much so; in fact, just as if it had walked out of the pages of M. Viollet-le-Duc.

A very well lithographed plate, by Messrs. Kell, shows a view of this back of the building, which seems strangely selected in place of the front, as if for the purpose of exhibiting the feature we have just referred to. For ourselves we are free to confess that, however archæologically correct this may be, we think it exceedingly ugly, and we believe that such kitchens in mediæval monasteries were not thrust so prominently forward. Such a one as that at Glastonbury or that at Durham may have been, but then they were buildings worth seeing. Such an example as this, like a beehive stuck all over with pipes, we feel pretty sure would have been kept well out of sight. Other points, against which we cannot but protest, are the manner in which this excrescence is attached to the main building, the squat proportions of the principal windows, and the manner the small circular turrets at the angles are thrust through the roof without springing properly above them. With these abatements the breadth and simplicity of the building is commendable, and it is with much regret that we learn that there is a probability of the work being put into the hands of military engineers, and of the consequent loss or mutilation of this original and striking composition. We expect they must have been frightened by the tower, which not being seen except in section in the illustration, is described by the author as designed upon the model of the celebrated specimen in the Château of Blois, which presents the same system of external balconies. Above the third storey it developes into a tower, and finishes with a dome, for which there is ample authority in the churches of Perigeux, Angoulême, &c. A short communication we need only notice, one from the President "On the Antiquities of Fréjus, in the South of France," and on the great roof over St. Pancras station, Midland Railway terminus, now in course of erection by Professor Donaldson, and we must postpone till our next number any notice of the remainder of the more important papers read during the session.

THE PLASTERERS' COMPANY'S PRIZES.

LAST week we called attention to the prizes offered by the Plasterers' Company, and gave the names of the successful competitors. Since then we have had an opportunity of seeing the designs at South Kensington. The competition is open to all students in the provincial or metropolitan schools of art, but the first and second prize in either case cannot both be taken by students of the central school at South Kensington. Altogether not more than a dozen models and sixteen designs have been submitted. Of the merits of the models of friezes it is impossible to judge, as many of them are placed horizontally on a table, some upright on a screen, all below the level of the eye, and in such a position that a spectator cannot get further from them than 4ft. Under these circumstances criticism is of very little value. The first prize has been awarded to A. Gibbons, a South Kensington pupil. It seems to us to possess no marked superiority over two or three others. The second prize falls to G. Japp, aged twenty-three, a professed modeller. This work is very cleanly modelled. The design is full of birds and little Cupids, eight or nine inches in height, and is suited for a wooden cabinet, or even a bronze panel. It is no more fit for a frieze than for a fender. It was absurd to give a prize for this work, as it must discourage those who stuck to the text and tried to model a frieze. It is excellently modelled, but it has an unpardonable fault for a continuous design. It will

not *repeat* satisfactorily. A model by J. Brooke struck us as vigorous and repeatable, and there is a clever piece of modelling, by G. Bradbury, aged nineteen, of Penzance. Another by G. Morgan, a South Kensington student, though not particularly novel, is good. Of the sixteen designs for centre pieces few possess any merit. W. Mackaness, South Kensington student, takes the first, and John M. Pinn, architect, the second prize. The design by John Brooke is, in our opinion, better than either, though of such a different character that it is difficult to institute a comparison. In the distribution of these and all other prizes the South Kensington authorities certainly take care that those of their own house shall suffer no wrong. The wisdom of fostering the head establishment at the expense of the schools throughout the country is at least questionable. To the works submitted by the local schools for national medals we could give but a passing glance. Next week we hope to notice them fully.

PROPOSED RAILWAY TUNNEL BETWEEN SCOTLAND AND IRELAND.*

SUBMARINE tunnelling bids fair to become one of the engineering questions of the day. It is about to be re-tried on the Thames, on a limited scale, by Mr. Peter Barlow, and on principles that seem almost to guarantee success. The various schemes for forming a tunnel beneath the English Channel are by no means despaired of by their originators, and now Messrs. Macassey and Scott come forward with a plan for connecting Ireland and Scotland by a tunnel extending from Glenstrone, in the Mull of Cantyre, to Cushendun, on the north-east coast of the county of Antrim, a distance of 14⅜ miles, to be connected at each end with the principal railway systems in either country. Their reasons for the selection of this route are that it is the shortest and that the bed of the channel in that part is peculiarly favourable for tunnelling operations, consisting as it does of mica shale with a comparative absence of running sand. They propose to construct the tunnel of a single line only, with an extreme diameter of 19ft., a depth of 21ft., and the clear width at level of rails 15ft. The invert is to be of the usual form, but with a deeper curve and of greater strength, and filled with ballast to the level of the sleepers, so as to deaden the vibration as much as possible. The side walls will vary in thickness, a maximum of 7ft. being proposed through the more dangerous ground, and 4ft. for the crown. The material to be used would be to a large extent sandstone, which abounds on the Irish side. For purposes of ventilation it is proposed to construct horizontal air drifts 2ft. 9in. in diameter in the sides, and similar drifts 2ft. in diameter in the crown of the tunnel, with openings in the centre at intervals of 50ft. Connected with these drifts would be air pipes attached to a hydraulic engine at the Antrim end, the power of which would be applied to exhausting the air in the drifts, and, by means of the openings, also, that in the tunnel. This rarefaction at the Irish end would, it is expected, produce a draught through from the Scotch side which could be modified to any extent. Three large ventilating shafts are proposed of the same sectional area as the tunnel, two at the Irish end and the other on the Scotch side, also a number of smaller shafts in the approaches to the tunnel. The cost of the work is estimated at £4,224,490, including the cost of connecting the rails with the nearest adjacent Scotch and Irish lines, and six years is named as a period within which it might be completed. A series of calculations have been prepared by the projectors to prove the probability of a return of at least 5 per cent. on the capital expended. The scheme is a bold one, but all the details have been carefully worked out, and present a possibility of success. The route itself seems to us the principal objection. It may be that it offers the least obstacle to the execution of the project; but who is going to travel by it when it is finished? Very little, if any, English traffic could be counted upon; as for mails and merchandise time would be lost by its adoption, and we think most passengers would prefer a short sea voyage to a railway journey to the south-west of Scotland, and then southward from the north of Ireland. It certainly might lead to the development of much mineral wealth on the Scottish and Irish coasts, but till that come to pass it must principally depend on Scotch and Irish traffic. We regard the project as Utopian. Supposing the engineering difficulties, which are enormous, to be conquerable, we don't see how the enterprise could pay. Mr. James Chambers's idea of making a tunnel under the sea between France and England has far more fascination about it than that of Messrs. Macassey and Scott, and there is scarcely a distant probability of Mr. Chambers's idea being realised.

* Report on proposed railway tunnel between Scotland and Ireland, by L. LIVINGSTON MACASSEY, C.E., and WILLIAM SCOTT, C.E.

A NEW ACADEMY.

IN the endeavour to help on a new and better system of art action and practice than that now in vogue, so powerfully supported and so universal, it is almost impossible to avoid noticing shortly, first, one or two principles guiding such system of art action, and the art societies founding themselves on it. No one will of course deny that the Royal Academy of Arts has always held, and still continues to hold, the very first place as an art influence; it would seem to be the last court of appeal in matters artistic, its annual exhibition the greatest of existing art results, and its schools models of artistic instruction and educational skill. So much is there to be said in its favour indeed, and so comprehensive is it, that we need to notice no other society, for all others have to a certain extent taken their tone as far as possible from this central art institution. No one ought to feel any prejudice against the Royal Academy, for has it not in its day done work when there was no other institution to do it or even attempt it? Those who belong to it think it well nigh perfect, and its late president, Sir C. Eastlake, is reported to have said that no one council meeting of the Royal Academy ever took place without its being taken into consideration how best to improve and perfect its mode of art action, its exhibition, and its schools. More than this cannot be said.

But let us consider for a moment what it is that this great and leading art institution of the time and country really does. First, the Academy as a body—and may it not be said individually?—has laid it down as a principle from which there can be no departing, that there are and can be but forty artists capable of finished high art work out of thirty millions of people—two or three architects, two or three sculptors, one or two engravers, and thirty painters. Of the vague term "high art" no definition has ever been given by the Academy. If there be one thing more than any other which distinguishes the present age and generation from the past, it surely is that the wall which then so strongly fenced round each nation and trade has been broken down. Protection has given way to Free Trade, and little perhaps do they think who have been so instrumental in bringing about this change that the last stronghold of that protection is yet to be sought and found in art! But this is the foundational idea of the Royal Academy.

Again, if the idea of the mere accidental figure of forty, forming the boundary not to be passed, be a matter, as it must be, of wonder, what shall be said of the fact that the mere *medium* through and by which colours are laid on canvas and paper is another wall of separation between those in and those out of this Academy. Painters in oil may be academicians, but painters in water may not be academicians! Yet, strange to say, the greatest works in the world by the hands of painters are in water colour—Raphael's cartoons, and the whole of M. Angelo's Sistine ceiling, together with the very curious circumstance that M. Angelo himself despised oil painting; yet can no water colour painter *as such* find entrance into the Academy. Indeed, he cannot even exhibit except as colourist of an architectural perspective, or in some other accidental and exceptional manner. Strange inconsistencies! but serving to show into what a state of artificial confusion art is at last got.

There are so many other principles of art policy appertaining to the Royal Academy and its management that I hardly know which to select, or how many; but I must content myself for the present, and for the main purpose of this note, with saying in the most distinct way, and after very considerable thought about it, that if another and a new art academy, on a national scale, and for the use of all gifted naturally with artistic power, ever comes to be founded, it will and must be mainly by the *reversal* of all those principles of art action on which the present central art institution of this country and time has been built and acts. This is saying a very great deal, but it may be proved. Let us look at one of them by way of commencement.

Any ordinary person, unprejudiced, and of common capacity, and without troubling himself about art mysteries, on being asked what he thought of landscape painting and landscape painters, would doubtless reply—that landscape painting was a very good thing, and quite as good in its way as historical painting, or portrait, or any other, and that quite as much capacity and natural talent and acquired knowledge must be needed for it as for any other, and that quite as long a training is necessary and must be gone through by the student of landscape as by the student of the antique, or for the purposes of historical painting, whatever that may imply. Certainly, and of course, says everybody. But, strange to say, it is all the reverse of this. Landscape painting is not *officially* recognised by the Academy; it is admitted on sufferance, and because it cannot be excluded. Landscape painting, as far as such an art *can* be taught, is altogether excluded from the Academy system of art teaching. It is quite impossible to imagine what would happen were anyone in authority to propose that some one student, with a natural liking and turn for it, should, by way of elementary commencement, copy and paint a *leaf* or a cluster of leaves. Such a revolution in Academy art could only be thought of in the very darkest times, and when every man had turned professed reformer. All political reformation and change is mere child's play, and quite innocent and harmless compared to it. It can serve one good we are quite sure, that of showing the state of art in this nineteenth century of the Christian era, and a century's space of Royal Academy existence. Leaves, flowers, trees, earth, and sky, are all equally unknown in the world of Academy life, and it is a little significant that on the spot to which the Academy is now banished there were noble trees on ground encompassed with brickwork, and the first thing, of course, done to make way for it was to cut them all down. We say a necessary but significant act.

To reform such an institution is impossible; another generation may see the end of it, but in the meantime it may be useful to try and awake attention to one means of art action on a new and untried but natural plan, viz.—that of encouraging the production and exhibition of drawings, paintings, and copies in material of the simplest natural forms, especially by the artists and workmen who now act as subordinates, not that such trial work is to be confined to such, for what could be more interesting than the presentment to the public by each individual artist of the results of his own mind and hand, and the

showing to the world how he saw the object before him, the same leaf or flower coming forth almost as a new creation from each artist, sculptor, and workman? All this has never yet been tried. No idea can now be formed of the interest and beauty to be found in a room filled with paintings of the simplest forms of vegetable life by the very highest as well as the humblest art powers the age can produce. We do not know, indeed, what the academicians can really accomplish—they do not know themselves—for there is no trial work, no condescending to elementary work and details, however difficult or elaborate or impossible of actual realisation. The future of art, as we think, must begin with this, to be followed by that larger decorative art visible to all. Art as it is is only for the few, fit only for dining and drawing rooms, but surely it is not too much to say that the great future must bestow it on the public and the many. But we must begin at the beginning, and that beginning must be with details and parts and simple forms. Imagination, we are told, is the soul of fine art, and serves to separate one man from another; but it would be found that two equally-gifted artists working at the same simple form, in the mere act of simple copying will differ from each other in the final result as much as if they had tried to imagine things entirely different—no two men being alike. In what way any one of our Academy artists could be induced to copy the simplest blossom and leaves the full size of life, and as seen against the pure sky, it will, of course, puzzle any conjuror to say. It may be an impossible feat, but surely it may be hoped with some confidence that the humbler rank of artists might be induced to contribute their labours to such an exhibition of art results by the artists themselves and as examples of personal artistic gifts and powers. It would help, too, to draw forth a "style"—one of the time and country, with nothing to hinder or complicate it, for the natural forms are always the same, nature never failing.

C. BRUCE ALLEN.

LINCOLN CATHEDRAL.*

NORMAN PERIOD.

FOR all speculation as to the character and extent of the first Norman cathedral erected at Lincoln by Remigius, the first Norman bishop, I must refer you to Mr. Poole's treatise. What is certain is that, with the exception of what remains of it at the west end, it has altogether disappeared. This fragment, however, is of the highest interest. It has been respected and preserved by all subsequent builders, and still forms an integral and very important portion of the west front. The outline of its simple and unadorned masonry is easily to be traced on the west elevation, and its massive proportions are as clearly visible on the plan. That we see in what is left the entire breadth of the west front of the original church of Remigius, commenced probably about 1076, there is no doubt whatever. How this design was terminated above, and on the north and south sides, is a matter of speculation. I think, however, that the solution of this problem is not so difficult a one as might at first sight be supposed. We have not time to enter upon it here to-day, but if I am correct in the supposition which I have formed, and which involves the existence originally of a single western tower, in place of the two western towers which actually exist, the opinion which Professor Willis and Mr. Poole appear to entertain that these towers were built either in restoration or in continuance of Bishop Remigius's design is incorrect. That these two towers, and other works to be noticed at the west end, were built after the second fire, which is recorded as having consumed the entire church in 1141, there is little or no doubt. They exhibit, up to the top of their third storey, in all their ornamental details, the characteristic features of this very date. They were flanked, on the north and south sides, with richly ornamented projecting gables, which still remain; and on their west side also with gables of probably similar design, which have been removed. But the weather moulding of these gables, still to be seen under the roof of the later work of the Lancet period, reveals to us the singular fact that the apex of both these gables, which corresponded with the centre of the two large circular side arches of the west front of Remigius, were not in the centres of the two towers, which latter were not, in fact, placed symmetrically with the earlier work of the west front. How these and other discrepancies of the second Norman design, which could not have been in harmony with that of the first, behind which it stood, were reconciled, we have no present means of knowing; but we may naturally conclude that they furnished the reasons which induced the gifted architect who masked these irregularities and combined the works of these different periods into one harmonious whole, to erect, towards the close of the Lancet period, the noble west front or screen, which still remains to us as it left his hands. Besides these two western towers, built at the very close of the Norman period, two other works of this date remain in the west front. The first is the circular arcade, immediately above the plain walling of Remigius' front on each side of the central arch. The second is the great western doorway of the nave, which exhibits, in the five richly ornamented orders of its circular archway, the latest features of the period to which it belongs.

TRANSITIONAL PERIOD.

Closely following the last-mentioned work, but of well-defined Transitional character, are the two other western doorways, those, namely, of the north and south aisles of the nave, that on the north side being of slightly earlier character than that of the south side; the limits of time within which all the three doorways were designed and built probably not exceeding ten years.

These two later doorways are amongst the most interesting and valuable remains of the entire structure. Although to be reckoned amongst the earliest works of the Transitional period, they contain not one of the characteristic features which distinguish the works of the Normans either in this country or their own; nor does their ornamentation resemble that of the works of any country of Europe of the same date. They prove to us, in fact, along with numerous other similar works in all parts of the kingdom, the existence in England at this time of a school of native artists, who were not only completely emancipated from those influences which had governed the designs of buildings for the previous eighty years of Norman rule in this country, but who were able to design and to carry out their works with an originality of thought, a fertility of invention, and a perfection of execution which most justly entitle them to our especial notice, as well as to separate classification.

Although they were, in reality, the earliest works of English design, properly so called, in the country, we are unable to call them "Early English" from the fact that this term has been applied to, and is generally received as indicating, the works of the subsequent or Lancet period. Neither, although belonging to that period in which the pointed arch was first used in this country, can we call them "First Pointed"—first, because that designation was also intended to apply to the works of the Lancet period; and, secondly, because in this really First Pointed period the whole of the arches of decoration are usually circular, as indeed are those of the doorways in question. Until, then, we are supplied with a better term, I shall continue to apply to them and to similar works that denominative expression which so aptly characterises the transitional nature of those intermediate works which were constructed during the prevalence of both forms of arch (used, as the latter were, simultaneously, but discriminately, in the same building), and which occupied, in point of time, the latter half of the twelfth century.

LANCET PERIOD.

We have no work in the kingdom of genuine Lancet character to which we can attribute an earlier date than the eastern transept and the choir of Lincoln Cathedral. We know, from undoubted documentary testimony, that they were commenced about the year 1190 by Bishop Hugh de Grenoble, and were on the point of completion at his death in the year 1200. The dignified simplicity of the whole of this work, and the vigorous boldness which marks the design of all its details, its simply clustered piers, the single vaulting shaft descending in their front in an unbroken line from the clerestory to the floor, their spreading capitals and projecting foliage, the bold sweep of their overhanging bands and circular bases, the deeply-moulded pier arches and vaulting ribs, and the tall single Lancet windows; above all, the largeness of treatment and the vigorous originality of conception with which the entire design has been conceived and executed, demand our highest admiration, and place this grand work clearly at the head, as well in point of time as of excellence, of the works of the Lancet period.

It is not to be wondered at that so noble an example should be rapidly followed by works designed in the same spirit. Within the next ten years several important buildings of similar character were begun; and even before the commencement of the thirteenth century this new fashion of building, the second characteristic type of English art in church architecture, had become firmly established in this country.

For those who desire to study the progress of style through the Lancet period, Lincoln Cathedral presents the amplest opportunities. We can trace the hand of the designer of Bishop Hugh's works, in continuation of that of the choir, along the east walls of the great transepts, as well in those of the east aisles as in the upper parts of the building; we can trace even the gradual slackening of the work, and its absolute cessation in the north and south walls of these transepts. Here a pause of many years must have occurred, probably whilst the crossing and central tower were rising, which, however, fell from insufficiency of some kind, *per insolentium artificia*, in the year 1239. Meanwhile Bishop Hugh, having been canonized, became the patron saint of Lincoln; the odour of sanctity attached to his memory attracted crowds of the faithful to the cathedral, and the contributions, which flowed in largely, permitted the rapid prosecution of the works, which, judging from internal evidence alone, must have been resumed about 1215, and carried out without intermission in the course of the next twenty years. These later works of the Lancet period comprise:—1. The central transept (west side). 2. Nave and aisles with north and south chapels. 3. West front, with north and south pinnacled turrets. 4. Chapter-house. 5. West porch of south transept. 6. The crossing and lower part of the central tower (rebuilt); and, 7, the two western doorways of the choir aisles. They were constructed probably in the order above given, and show, with the exception of the two last-named, but slight differences of style in their details.

With regard to the Chapter-house there exists a singular discrepancy between the internal evidence afforded by the character of its work and the external evidence of documentary history. We are told by Giraldus Cambrensis, on the authority of Wharton, that Bishop Hugh built the "Capitulum," a term which can only correctly be interpreted "chapter-house." Professor Willis, feeling convinced that the work was of later date, endeavoured to explain away the difficulty by arguing that the word "*capitulum*" meant, in this case, "*caput ecclesiæ*," the head, or east end of the church.

It is always unfortunate when, as is sometimes the case, antagonism arises between the internal evidence furnished by the building itself, and the external evidence of contemporaneous history. In the earlier days of archæological study the tendency was to discredit the former and to accept the latter; in these days the results of strict analytical investigation and comparison of the minor details of the buildings of the middle ages dispose us to place much more reliance upon this species of internal evidence than on even the most unequivocal assertions of ecclesiastical historians. The inductive reasoning based on the former appears to be safer than the possibly hearsay testimony of the latter.

Without, then, contending for, or, indeed, accepting, Professor Willis's interpretation of the word "*capitulum*," as used by Giraldus Cambrensis, I have no hesitation in asserting that the stonemasons who executed the work of the Chapter-house of Lincoln Cathedral did not live in Bishop Hugh's time, but 20 or 30 years later.*

* Lecture delivered to the Members of the Lincolnshire Diocesan Architectural Society at their Annual Meeting at Lincoln, on Wednesday, June 17, 1868. By EDMUND SHARPE, Esq., F.R.I.B.A.

* In a paper which was read at Lincoln by the Rev. J. Dymock, on "The Documentary History of Lincoln Cathedral," the day following that on which Mr. Sharpe's lecture was delivered, the difficulty above referred to was completely solved by the fact announced by Mr. Dymock, that, on reference to the original text of Giraldus Cambrensis, he had discovered that the passage in question had been erroneously transcribed and printed by Wharton, the real word in the MS. being plainly and legibly written, not "*capitulum*," but "*capitium*," which cannot otherwise be interpreted than as signifying the head or east end of the church.

The two latest of this second group of Lancet works, namely, the west porch of the south transept, or Galilee porch, as it is usually called, and the two doorways situated at the west end of the choir aisles, exhibit much greater elegance of treatment and delicacy of execution than the others. Of these two works, the former may be advantageously compared with a similar work, similarly named, at the west end of Ely Cathedral, which belongs to the earlier, as this porch does to the latest part of the Lancet period; whilst the exquisite carved work and capitals of the former correspond closely with those of the elegant work of contemporaneous date at the east end of the choir of the same cathedral, which was commenced by Bishop Northwold in 1235.

Before quitting the work of the Lancet period it may be well to notice an opinion which has prevailed, and which is due, I believe, to Professor Willis, who discovered that the name of Bishop Hugh's architect was Geoffrey de Noiers, to the effect that the design of the east transept and choir of Lincoln Cathedral is of French origin. The only feature, however, in this work which at all resembles French work of this date is the pier capital of the choir, which, with its double row of stiff foliage and four attendant shaft capitals, all attached to the same block, is not unlike those of Chartres and Goissons. But we have in the pier capitals of the presbytery of Chichester Cathedral, designed and constructed only a few years earlier, at the close of the Transitional period, the very idea in genuine English workmanship, of which these Lincoln capitals are the Lancet version, and to which, with their detached shafts, they bear a much stronger resemblance than to the capitals of any French cathedral with which I am acquainted. In all other respects in the general outline of the design, and in all its minor details of mouldings and carved work, there is no resemblance whatever between the work of Geoffrey de Noiers and that of French buildings of corresponding date.*

FASHION IN ARCHITECTURE.†

FASHION in criticism, as in art, has its day, and works its wrong. Goldsmith makes his connoisseur advise a neophyte, if he would be held in repute as a critic to praise always the works of Pietro Perrugino. A similar kind of advice, one would think, had formed a main part of the education for their pursuit of a large proportion of critics both professional and amateur, both in architecture and the sister arts. Tell one of these, while blindfold, that he stands before a church by this architect or a townhall by that, and he would dictate at once a proper critique for the publication he represents; but put the same man with his eyes open before the most meritorious work of an unknown artist and he will know equally well how to ignore all its beauties and exaggerate all its defects. This is a charming and sufficiently notorious phase of modern architectural fashion, happily not extending to the leading journals connected with architecture, but very apparent from time to time among the minor luminaries of the art press. Some years ago a periodical, devoted chiefly to ecclesiastical matters, despatched a critic, a clergyman, in fact, for the time without a cure, to descant for the benefit of its pages on the recent ecclesiastical erections in this part of the country. He visited Liverpool, enlarged on the barrenness of the town and neighbourhood in what concerned good church work, dwelt earnestly on the defects of all buildings by local architects, and revelled in admiration of the three or four which he was told were the works of some metropolitan magnates whom his editor delighted to honour.

His discrimination could scarcely have been very acute, for one of the most characteristic buildings of one of these very Titans in church design having been described to him by its sexton as the work of a local architect, he launched out freely in abuse of all that most marked it as its real author's work; he was duly informed through the press of his little mistake, but I do not remember that he acknowledged his obligation for its correction.

Let all beware how they hang their faith or their opinions in art on any information but that of their own eyes (supposing these sufficiently tutored to inform them correctly), for otherwise they will often have to retract them, and prove the rottenness of the staff on which they rested their belief.

An editor being handed a book for reviewing by a pet author, asked "had you not better, my dear sir, review it yourself?" Does this ever happen with respect to architectural works? If not, how is it that we find ourselves dropping from the sublime to the ridiculous, when sometimes induced by the glowing account given of some new building to go out of our way in expectation of gaining valuable ideas, or at least of gratifying our taste by dwelling for a time on what is described as so purely excellent.

I have been several times trapped thus, but am growing wary, as I have in most cases found that the buildings so rapturously lauded were simply examples of one or other of the prevailing "fashions" of the day, and in scarcely a single instance have I been in the least repaid for my time and trouble in making the visit.

It seems to me that a system must exist of crying up these passing fashions, well-recognised and mutually exercised by those who excel in them, since the same kind of eulogy is not, so far as I have seen, usually bestowed on any, even though much superior works, which do not step out of the recognised path of real architectural principles.

I remember to have heard it said that certain artists, anxious to place high prices on their works, made exchanges of their pictures with each other at the same nominal hundreds of guineas; and when it was related to a patron that such and such a distinguished brother brush had become possessed of the noted canvas at this high rate, he felt at once convinced that he could not be wrong in giving at least as much for its fellow.

Buildings cannot be exchanged quite in this style, but their praises may; and it would be better for our art, in respect of which, after all, I may be mistaken in imagining such a system, if authors as well as critics would abstain from excess in their descriptions of their praises, as most men of any experience and cultivation, either professionally or critically, really know pretty well the proper rank which a work is entitled to take, and know also pretty well how that rank should be stated.

Passing by this fashion of architectural criticism, a matter of no slight moment, however, to the interests of the art, I would notice a few other points in which system, and not principle, prevails to the disparagement, I think, of good art, and tending to foster what is in a great measure weak and spurious in design at least, and sometimes too in construction. One of these fashions is that of confining our study of architecture, and, as far as we can, our practice, to one style only, than which no course, I believe, has a more narrowing and damaging effect on an architect's powers of thought and design.

The custom exists, so far as I can see, much more generally among those who profess a decided preference for the Pointed styles than those whose tastes are more professedly Classical; but in either case injury is, I believe, suffered by the architect in his power of design. Preferences may and will exist, but exclusion should not; for all, as I have said, of these advanced styles of our art contain matter of immense value for the modern designer, and he who shuts his eyes to any deprives himself not only of a high source of intellectual pleasure, but of a part of that mine of pure precedent, the largest knowledge of which, as Sir Joshua Reynolds truly remarked in regard to painting, will ensure the largest powers of original design.

Do not fear the clashing of the claims of varied styles, and do not look for their combination. Many have, if we examine them to their sources, nearly a common root or stem, but all have diverged, and it is generally—may I not say always—somewhere about the middle point between their birth and culmination, if the latter has been reached, that we find them in their greatest purity of treatment and strength of individual character.

At these middle points of excellence we shall find that every style has elements of value to the designer in every other, and many an I many are the happy hints which may be derived unexpectedly and sometimes almost unconsciously from one style to enhance another. The architect cannot, if he have a general practice, afford to ignore any one of the styles recognised in the professional practice of the day, or if he do he is likely to find himself some day placed in the unpleasant and humiliating position of floundering in a design he cannot master, or obliged to find help where he should be giving instructions.

To disparage a style because not of this or that school is in a measure to bring our art into contempt, and too often marks the man who is conscious of his own incapacity in the path he decries; while, on the other hand, I feel certain that he who with natural fitness and thorough cultivation essays his powers in every pure style as occasion may require, will stand on as good a level of excellence at least as he who, by excluding all but one class from his knowledge, or at least his study, narrows in so far his perceptions, and is in danger of crippling his powers.

A fashion of rejecting local and excellent building materials for those of an exotic and perhaps not at all superior kind, is a practical affectation much to be discouraged, and it appears to be on the increase. As our population increases it will tend to exhaust the resources of certain districts, and restrict the proper measure of labour in others; while it is to be observed that it is to a great extent certain that the stone, clay, and other building materials existing in any district are those not only best suited for picturesque and artistic blending with its natural features and foliage, but often also the best adapted to withstand the local variations of climate.

The use of brick for the exterior of buildings of importance, such as churches, where good building stone, of moderate price and cost of labour, exists, and in cases where economy is not so rigidly inculcated as to make the use of brick peremptory, is, in my opinion, a mistake in art, since the higher effects of architectural design are capable of being much more fully developed with the better material; while brick, even of superior excellence, soon becomes dingy and unsightly under the influence of our damp-laden atmosphere and smoke-charged breezes.

High indeed should be the qualities in respect of fine proportion and pure form possessed by a building intended to hold its own in a garb of simple brick against all that may be raised around it with the superior advantages of good coloured and well wrought stone; and happy should the architect be who obtains a verdict of equality even for his work under the detractive effects of such material. The example of Bruges and other continental cities in which brick architecture prevails, on account of the lack of building stone, afford no sufficient precedent, in my opinion, for the adoption of this style in England. I have not yet heard of any such grand saving of cost as compensates for loss of style, and I should much regret it if this fashion, led by a few metropolitan architects, should ever become general.

The introduction of iron in constructive architecture is a feature of quite modern practice, and goes far in many cases to overcome difficulties which could scarcely otherwise be surmounted. Its visible use, suitably decorated, interiorly is evidently within the proper scope of true architectural design, and I have seen instances of its skilful adoption, and not least so in Liverpool, in external details. These latter, however, I am inclined to consider as not sound architecturally; for although by care in renewing paint and varnish the surface of such dressings may be preserved in great measure from decay or serious deterioration, the exposure of metal, in combination with stone and brickwork, to the open rays of the sun seems likely to constitute a cause of disruption in the work, since the expansion of the metal being greatly in excess of that of the stone or brick, must constantly change the dimensions of the former under varying temperatures.

I may be told that this difference is so slight as to be of no moment; but I dissent from this view, for it will be found that a wooden door hung on gudgeons and with iron bound angles will expand so much as to become completely fixed on a hot sunny day, while under ordinary temperatures it would be perfectly free—an example of large expansion which leads me to the conclusion that this fashion of introducing external ironwork in architecture has serious objections, and that it should be used only in such manner as will protect it from the direct rays of the sun, if the ill results of undue expansion are to be avoided.

As regards the decoration of our buildings at the present day, a system prevails far too commonly of leaving the carving of enrichments, capitals in both Pointed and Classic buildings, trusses, scrolls, &c., to the taste of the carver, giving, if anything at all, a mere slight sketch for his guidance. A school of clever architectural carvers has, it is true, grown up in the country, chiefly under the encouragement to their craft arising from the extended use of carved ornament in many

* To be continued

† Read before the Liverpool Architectural and Archæological Society by H. P. HORNER, architect. Continued from p. 466.

of the larger churches built or restored under our leading ecclesiastical architects. In many cases, no doubt, they have been supplied with amply sufficient details, but still they have for the greater part been taught only in one style, and that to a great extent not of our own country, but adapted from examples in France.

Much of the mediæval carving in France is no doubt very skilful, and some of it really beautiful, but I consider that its conventionalism is often carried to excess, and in so much decidedly inferior to the best stone carving to be found in our own large churches and cathedrals. At all events, much of what these skilful modern carvers produce is of this over-conventionalised kind, and also now very hackneyed, and it has become absolutely wearisome to fall again and again on the same forms and arrangements of ferns and mallows, some tolerably natural, but others quite the contrary, however well-executed; and in this respect, as well as others, I am quite at a loss to discover what advantage our late modern Gothic buildings are supposed to derive from the fashion of adopting French tracery and foliage to the exclusion of English, with many other quips and cranks of detail which render the French originals in so far inferior to contemporary English works, and tend to increase labour on our buildings without affording adequate effect. These carvers, left to themselves, will often produce in Classical buildings the most extraordinary combinations of incongruous styles of ornament—Greek anthemia, Italian scrolls, Gothic flowers and Elizabethan strap-work, mixing, but not blending, in most admired confusion.

The simplicity and consistency which meet in the best English Pointed work I do not see excelled, if indeed equalled, in that of any continental country, and I should think it much to be deplored if our native insular style were to be neglected or deserted, rich as it is in resources for endless varieties of effect, in favour of one by no means superior, and which grew up in itself complete, while foreign in many points to our own, and thus comparatively incongruous with our English tastes and habits of thought.

We have further the fashion of using Italian Gothic where surely our own in some of its varieties would be more fitting; and this, the least pure and interesting of all the forms of Pointed architecture, we find pressed into the service of secular design as a contrast to what is considered more properly the province of English and French Pointed. In neither one nor the other of the exotics do I recognise any real advantage whatever above our own, and there is a masculine, vigorous treatment in the latter, especially in the plainer and therefore most adaptable examples of its use, which I have seen nowhere in the published plates or photographs of foreign Gothic work, none of which, however, I have had any opportunity of personally inspecting.

In scale of height and in some flights of constructive power the continental cathedrals visibly exceed our own; in proportion, beauty, and completeness and elegance of composition ours, I think, as much exceed theirs, and I am not myself enamoured of those evidences of difficulty sought and met which are apt to disturb what should be the repose of artistic enjoyment by the constant thought, how dare they have ventured it? how could they have done it?

One other fashion, if it must be deemed so, demands notice, and it would be a happy day for architecture when it should die out. The debasement of any art in its practice to the level of a mere business carries with it, among other evils, the certainty that the real living distinctions between true and false art will, under such a lowering influence, be to a great extent lost sight of; and that this has, to a great extent in England, taken place, as regards architecture, during late years is undeniable. The fact, notwithstanding, remains sure, that to be really an artist a man must be naturally fitted for it by acuteness of apprehension with respect to proportion, grace, beauty, and this natural fitness must be fully cultivated to secure good results.

Nothing is much more common, however, than to find youths put into architectural training who have never evinced the least apprehension of what really belongs to art in that or any other walk, but who are brought into the profession merely perhaps because their social connections give promise of a field of practice, or that in a large family it is difficult to find varieties of calling or employment for all.

Under judicious teaching an intelligent pupil, though with little original leaning towards the pursuit, may gain much of what constitutes fitness for an architectural practice, but this is more often in the direction of construction than of design; and there can be no doubt, I think, that the cause of the great number of inartistic, vulgar, and exaggerated designs with which our land teems is to be found in the opportunities afforded by this kind of education and practice to men who are able to construct works, often of magnitude, but who have never possessed or acquired the taste needful to give grace and interest to what they or their patrons desire in an architectural shape.

Principles, not fashion, I would say, in conclusion of this hasty sketch, must be paramount with the designer and the critic, if good design and sound judgment are to prevail in our art; and fully believing that each and all of the phases of fashion I have touched upon are in greater or less degree inimical to this result, I venture to commend the matter to your consideration, while I ask you to forgive the sad insufficiency and rambling arrangement of this brief essay.

DESIGN FOR THE PROPOSED NATIONAL GALLERY.

IT will be remembered that when the competitive designs for the new National Gallery were exhibited to the public, we criticised them somewhat minutely, and concluded that neither design was worthy of the site or the purpose for which the new building was intended. After ample time for consideration the Government came to a similar conclusion, but at the same time they said the design of Mr. E. M. Barry most fully met the required conditions. And so the matter has slept, and we suppose would have slept eternally, had not the Law Courts' embroglio compelled the Government to try to please all parties. Mr. Street having been chosen architect of the new Law Courts, not exactly because his design was the best, but because he was thought to be the best architect for the purpose, the Government felt bound to do something for Mr. Barry. And it cannot be denied that Mr. Barry had a strong claim, as his plan for the Law Courts had been selected jointly with that of Mr. Street. Mr. Barry was, therefore, in obedience to the spirit of compromise, chosen as architect for the new National Gallery. We, therefore, select this week for illustration Mr. Barry's design, as submitted in competition last year. Having on a previous occasion expressed our opinion of this design, it is unnecessary for us to do so now. Under the circumstances, Mr. Barry, like Mr. Street, will no doubt feel justified in modifying his plan and his architecture, as his experience, assisted by criticism, may suggest.

MEMORIAL WINDOW AT GUILDHALL.

THIS window, presented to the Corporation of London by the operatives of the cotton manufacturing districts, was on Wednesday handed over to the corporation; in other words, it was inaugurated. The memorial indicates the gratitude felt by the Lancashire operatives for the fund subscribed in London during the cotton famine. The window, which fills the eastern end of the hall, is new only as respects the glass. The stonework is of the fifteenth century. That the glass is by Messrs. Clayton and Bell is a guarantee of its general excellence. It has the true appearance of fifteenth century work. There is plenty of light, plenty of red, enough blue, and abundance of lead, without which no window can look well; but there is not sufficient yellow and green in the composition, and the treatment of the City crest and the Lancastrian rose is unworthy of a Long Acre coach painter. Making every allowance for the gloom which for months covers the City, we are firm in our opinion that a little more colour is wanted, purple, olive, and even black. It must not be supposed that these colours do not find place in the window at present; what we would imply is, that they are insufficient in quantity. Taken as a whole, it is the best modern window of which we have any knowledge, and the difficulties surrounding design for painted glass can only be appreciated by those who have given much study to the subject. The window is divided into three sections, the central section being subdivided into five lights, and the sides into two each. The middle division is devoted to historical subjects connected with the City of London. The north side contains figures of Lancastrian worthies, and the south side men of mark of the City. The subject of the lower tier of the central portion of the window is illustrative of the rebuilding of the City by Alfred the Great, that of the upper tier being devoted to the subject of the grant of the charter to the City of London by William I. The two figures in the side division on the north side are full-length portraits of Sir Richard Whittington and Sir Thomas Gresham; those on the south side being of John of Gaunt, Duke of Lancaster, and Sir Thomas Stanley. In the tracery openings above these portraits are introduced, together with the Lancastrian rose and the City crest, the herald's bearings proper to each figure; while in the tracery openings of the main portion of the window are represented the shields of the twelve City companies. At the base of the window is an inscription illustrative of the origin and object of the window.

INTERIOR VIEW IN CHEVET CHURCH OF ST. QUENTIN.

THIS sketch, taken in the aisle of the apse, looks into one of the chapels, which were represented externally in a former illustration (see BUILDING NEWS, No. 701). The peculiarity of the arcade of three arches at the entrance to each of the chapels is likewise to be found at the church of St. Remi, at Rheims, and also cleverly managed in that of Notre Dame, Chalons-sur-Marne; in these cases the arches are not so extremely stilted as at St. Quentin, neither have they the windows over them which form a clerestory to the aisle of the apse in this example. The detail of this chevet is excellent, which we trust our illustration sufficiently shows.

WIMBORNE MINSTER, DORSET.

AN interesting paper on this minster was read by Mr. J. Medley Tulford, at the last quarterly meeting of the Exeter Diocesan Architectural Society. The paper was illustrated by several very clever drawings. The minster was founded, he said, A.D. 700, by Cuthberga, daughter of one and sister of another king of the west Saxons, who became the Abbess. The minster is dedicated to St. Cuthberga. A monumental brass, still existing in the church, records that Ethelred, elder brother of Alfred the Great, who was mortally wounded in a battle with the Danes, near Wimborne, was buried in the church. The nunnery was dissolved by the Danes, and Edward the Confessor afterwards converted the house into a collegiate church. The extinction of the college took place in 1547 (Edward VI.), and nearly all the manors round Wimborne, the advowson of the college church, the deanery, and all the prebends and all the chantries within it were given to Edward Duke of Somerset. Among other facts mentioned in the historical portion of the papers, it was stated that the churchwardens paid for the repairing of the copes, altars, chasubles, &c., after the Reformation, and that this was the only church in the country where the choral service of the English church had been continued with slight interruptions since the Reformation.

With reference to the statement of the burial of Ethelred, Mr. Grey said that it was generally believed, though his tomb was in the church, that he was buried in the market place. He also mentioned a curious fourteenth century painting, which formerly existed on the ceiling of the vestry, but which had now been covered with whitewash.

TECHNICAL EDUCATION.

CLASSES have been formed for the purpose of giving instruction in practical geometry, and its application to building generally, in arithmetic and mensuration, in practical architecture and constructive detail, in the use of algebraic formulæ in the calculation of strength of materials, and in other matters concerning the science of carpentry and joinery. The terms are:—entrance fee 1s. and monthly payments 1s. 4d. (paid in advance,) the month being four weeks. The classes meet every Wednesday and Friday evening, at St. Gabriel's and St. Saviour's schools, Glasgow-terrace, Lupus-street, Pimlico, from 8 to 10 in the summer half year, and from 7.30 to 9.30 in the winter half year. The services of a most efficient and practical head master have been secured, and the students will from time to time be invited to engage in competitive prize essays, drawing, &c. Application for membership may be made any Wednesday or Friday evening, and any further information will be given by Robert Harvey, hon. sec., 21, Charlwood-street, Pimlico, S.W.

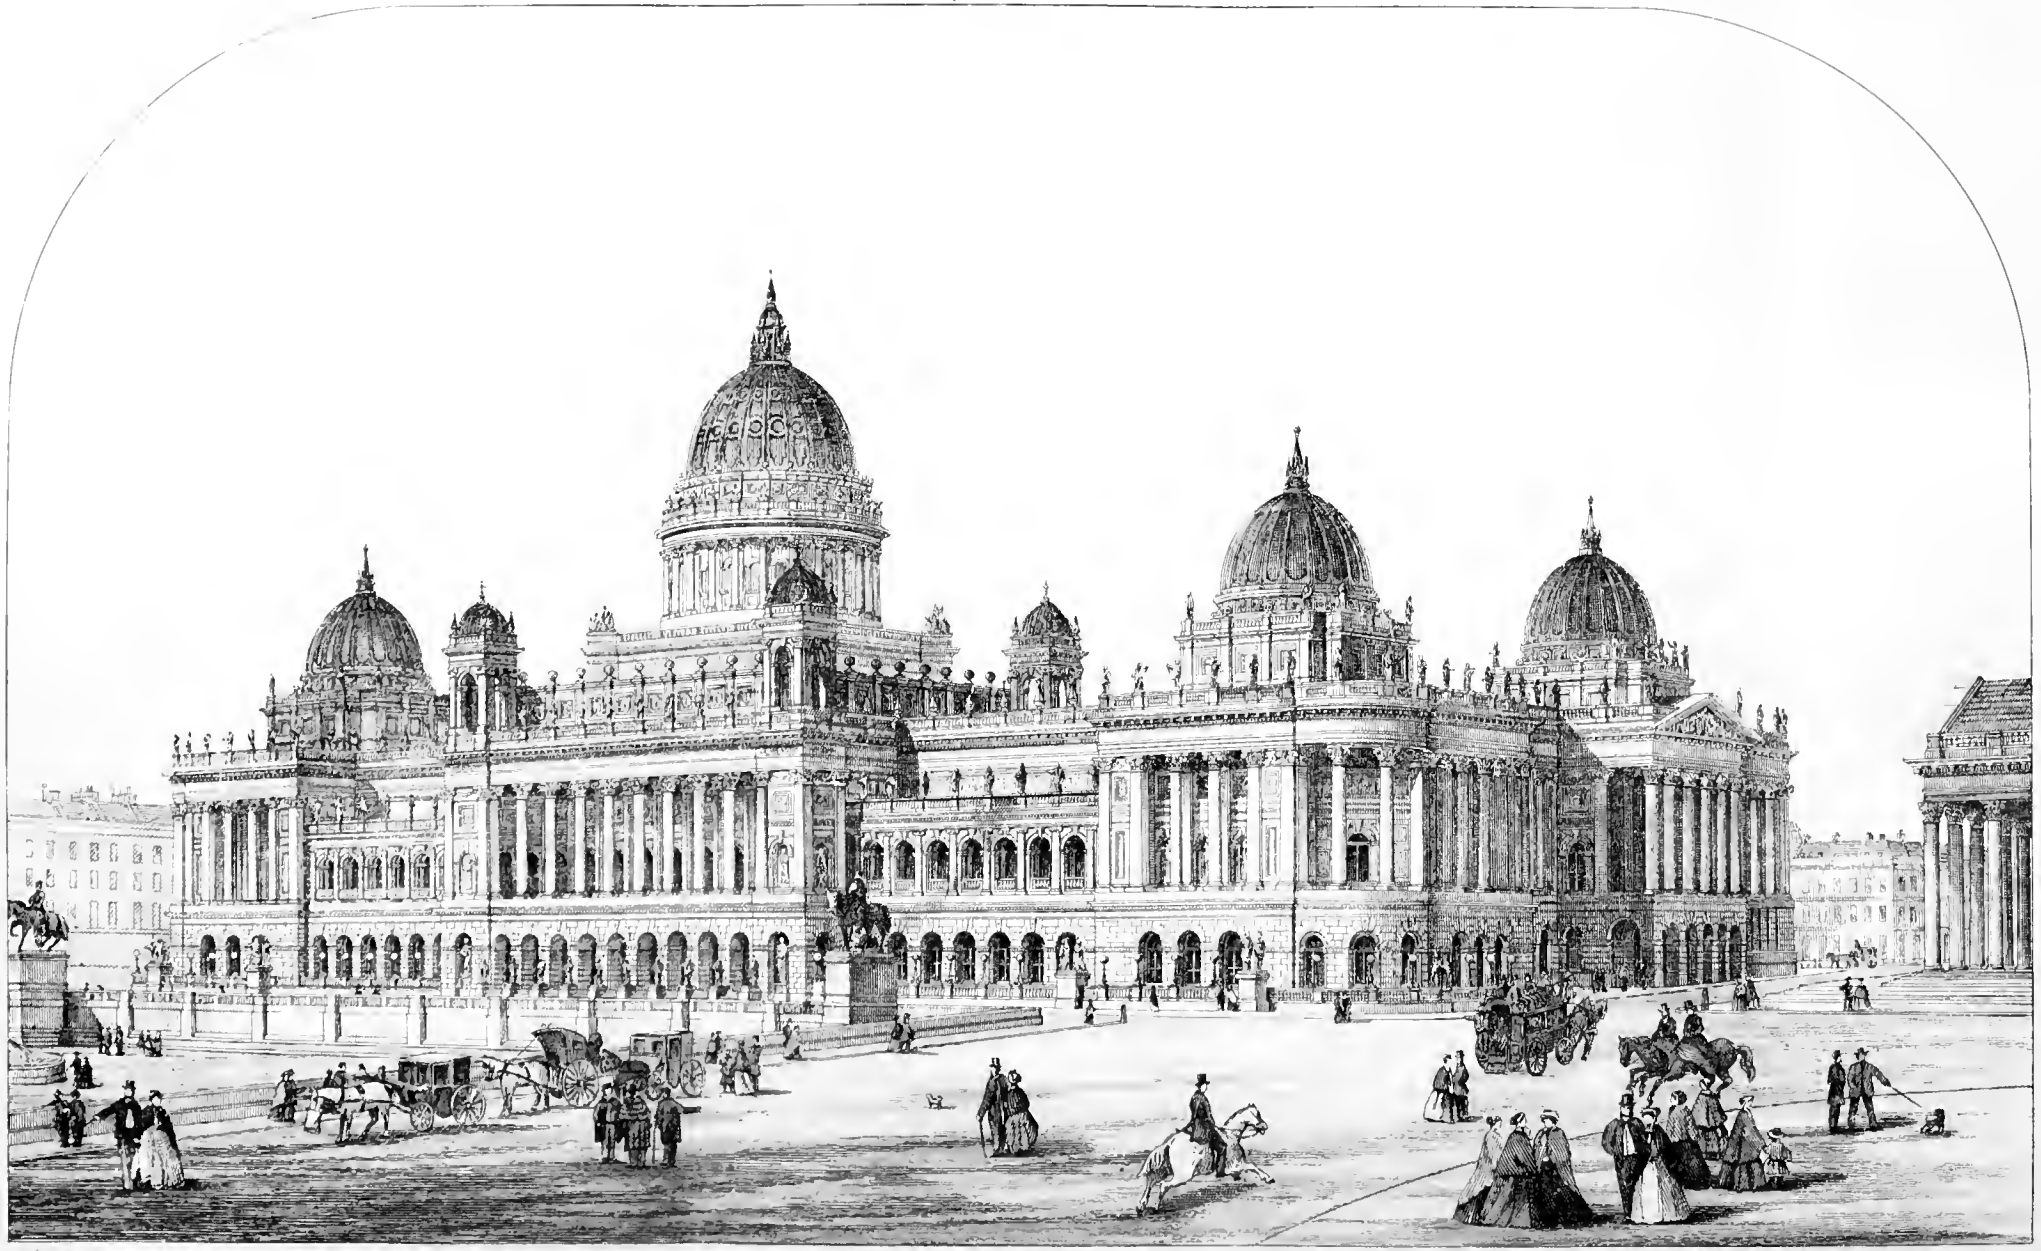
VIEW IN CHEVET

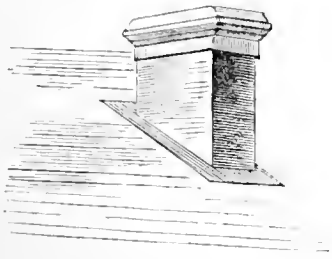
Printed by Whiteman & Bass



Design for the Proposed National Gallery, Trafalgar Square.—BY Mr E.M.BARRY, A.R.A.

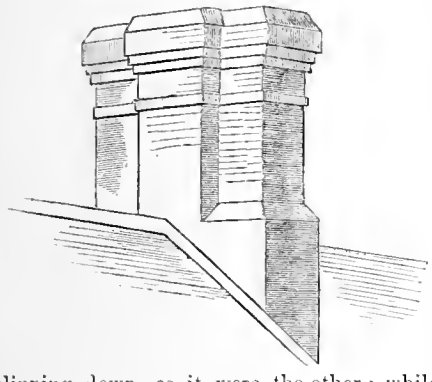
CONSTRUCTIVE AND ÆSTHETIC DESIGN.—XVII.

THERE are few things that concern our prosaic domestic architecture so much as the external appearance and design of chimney stacks—features not long ago looked upon with a pedantic disdain as quite repellent to the spirit of literal correctness, so-called Classic taste that held supremacy, and in obedience to which chimney heads never showed themselves above our parapets and gutters. Of late a marked improvement in these useful appendages has been witnessed, and we may here profitably note the most

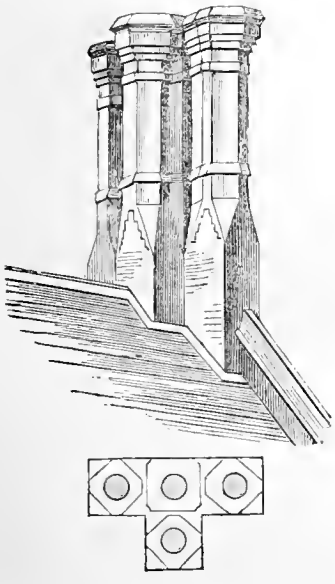


useful and effective types for our development. From the most insipid baldness they have assumed the character of most elaborate adjuncts, peering above our roof tops, and occasionally transcending in their shafted and turreted outlines the structures from which they rise.

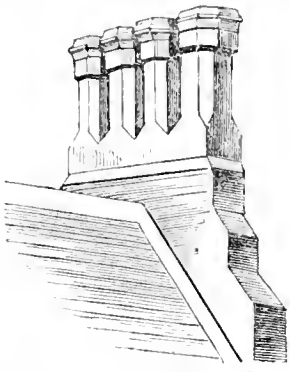
Chimney stacks may be considered under two heads—their position in regard to the building, and their design *per se*. They spring from ridges, slopes, and gutters, sometimes sitting or straddling across the one and



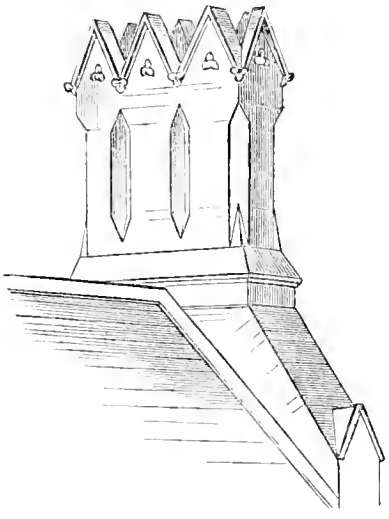
slipping down, as it were, the other; while frequently we find them perched in all conceivable positions, cutting awkwardly the lines of hips and valleys, or so unbalancing



the skyline of our buildings that they positively more detract from the general effect than help it. Of course we cannot and ought not to plan our fireplaces for our stacks, nor should we leave the latter entirely to look after themselves. Nothing, I think, is more disagreeable to the eye than the appearance of a stack on the sloping side of a roof, particularly when there is no apparent wall or base for it. It is true we are often driven to the committal of such a questionable thing, and I think there is a certain angle both in flat and high pitches that is rather more favourable than others. Above an angle of 30 deg., which may be regarded as the limit of apparent re-

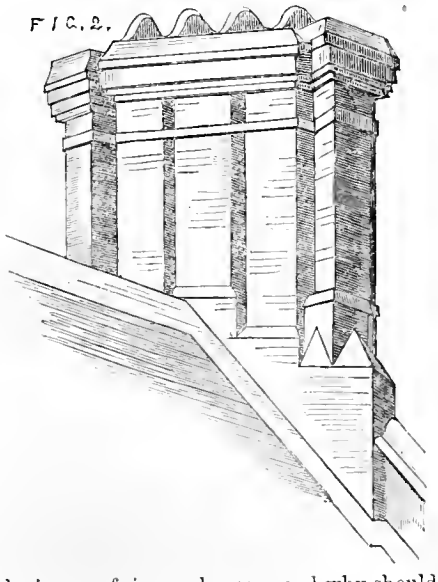


pose, a mass of work like a chimney stack has an effect of slipping, which effect increases in every steeper pitch till we arrive at a decidedly acute one—say of 60 deg.—the steepness of which renders the mental vision less uneasy by reason of the self-evi-



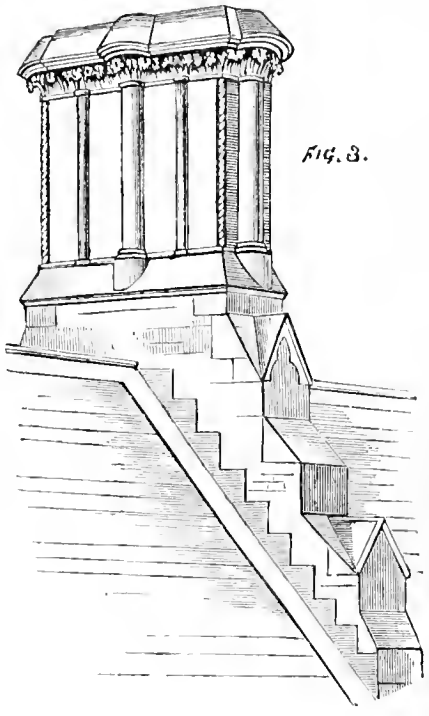
dence afforded. Our outward senses require repose or assurance in these matters; their deception often defeats the end of true art. Such a thing as a pinnacle or cupola on a

FIG. 2.



sloping roof is rarely seen, and why should smoke erections be an exception? Regularity of springing line—that is, the avoidance of an appearance of indifference or carelessness in the position of stacks as they emerge from the roof—is essential in all buildings in the regular or "Classic" styles of art; and affected irregularity in *any* style is both stupid and condemnable.

FIG. 3.



The plans or bases of chimney stacks assume a variety of form, from the simple elongated or square form to regular figures partaking more or less of polygons or crucial shapes. These complex forms may have simple square plinths, the angles being variously weathered or capped, or they may rise from the roof of similar form, though in the latter case the angles and nooks that are formed are expensive in lead aprons and flashings, and get clogged up by snow-drifts. In stacks elongated in plan, as those of party walls and the like, elevational variety may be got by recessing every other flue, or by alternating them at right angles and diagonally, or alternative forms, as round and square, may be employed with good effect. In these same kind of stacks, where they sit equally on both sides of ridge, it adds much to the appearance to see the wall from which the stack rises coped or stepped above the slating, figs. 2 and 3. With steep roofs there are rather awkward triangular spaces left under the plinth set-off of stacks. It shows how this difficulty can be met by stepping the separate shafts to the inclination of the roof slopes.

SCHOOLS OF ART.

THE awards made by the Science and Art Department to the Stoke and Fenton School of Art have been published, and are as follows:—National competition: silver medal, John Henk, modelling from nature; bronze medal, Alfred Bentley, modelling from nature; bronze medal, F. D. Bradley, porcelain painting; bronze medal, W. Boote, porcelain painting; bronze medal, R. Nabney, porcelain painting; book prize, J. Slater, design for earthenware. Free scholarships for one year, the Science and Art Department paying their fees, have been awarded to the following students for advanced works: A. Bentley, T. Emery, James Griffiths, Josiah Hassall, J. Longmore, T. Longmore, John Henk, R. Nabney, John Slater. Book prizes were awarded to the following students: W. Broad, figure drawing; Henry Corden, mechanical drawing; Thomas Spilsbury, ornamental drawing; W. Wood, architectural drawing. Francis Dutton got honourable mention. In addition to the above twenty-seven students passed in the art examination in March last, of whom seven took prizes for excellent papers.

PARLIAMENTARY NOTES.

On Friday night in the House of Lords Lord Chelmsford in bringing up the report with amendments of the Artisans' and Labourers' Dwellings' Bill, explained the various amendments which had been introduced by the select committee, and he expressed his belief that if their lordships passed this bill it would effect a great and substantial improvement in the dwellings of the labouring classes, while it religiously protected all the rights of property. Lord Portman said that the state of the bill now, as compared with its condition when it came into that house, fully justified its reference to a select committee, and he believed that it had, by their lordships' care, been made a useful and workable act. The Earl of Shaftesbury thought that the bill, as altered by the select committee, would be a useful and workable measure. The report was brought up and agreed to.

In the House of Commons, Mr. Bentinck obtained leave to bring in a bill to prevent the removal of the tower of the church of St. Mary Somerset, in the City of London, and for vesting the tower and the site thereof in the corporation of the City.

On Tuesday night in the House of Commons Mr. Gregory called attention to the present condition of the Royal Irish Academy, stating that in consequence of the mismanagement and extravagance of the Board of Works Department the Academy was inaccessible to the public, and he wanted to know what the Government intended to do in order to place the works of art more at the disposal of the public than they were at present. Mr. Disraeli said there was a commission sitting to inquire into the whole of the art institutions of Ireland, and he hoped that the result of their labours would be to terminate those abuses of which complaint was now made.

Building Intelligence.

CHURCHES AND CHAPELS.

The foundation stone of a new Wesleyan Chapel at Hungerford was laid on the 8th inst. It is to be erected of brick, with Bath stone dressings, in the Early Gothic style, from the design of Mr. Wilson, of Bath, the contractor being Mr. Philips, of Swindon. It is to contain 400 sittings, and will cost £1,800.

On Tuesday week the foundation stone of a new edifice erected by the Free Church congregation at Stonehaven was laid by the Earl of Kintore. The building is in the Decorated style of Gothic, simply treated in general detail. A commodious session-house is attached to the building. The cost of the building is about £1,500; and it will accommodate 500 in the area. The height to the apex of the ceiling is 33ft. The architect is Mr. James Souttar, Aberdeen.

On Monday week Bishop Trower, acting for the Bishop of Lichfield, consecrated a new cemetery at Market Drayton. It contains two stone chapels, built by Mr. C. Wright, of Nottingham, and designed by Messrs. Clarke, architects, of the same town. The cost of the cemetery, including the chapels, is about £2,200.

On the 2nd inst. the parish church of St Andrew, Dover, was reopened, after restoration, under the direction of the Ecclesiastical Commissioners. The whole of the chancel has been raised one step, and a new altar and pulpit added. The old ceiling has been removed and an open roof substituted.

On St. John Baptist's day the village church of Vaxley, Suffolk, was reopened after restoration. The chancel has been rebuilt, and the whole of the nave reseated. Mr. Blackbourne, of London, was the architect.

The foundation stone of a new Presbyterian Church, to be named "West Coates Church," was laid at Edinburgh yesterday. It will be cruciform in plan, and will be erected in the later style of Pointed Gothic. It will be built of freestone, and will seat 900 persons at an estimated cost of £7,500. Mr. Bryce is the architect, and Messrs. Oman and Mansom the contractors.

The new church of St. Paul, Glenageary, was consecrated on Wednesday week by the Archbishop of Dublin. It is in the Gothic style, and capable of seating about 600 persons. Mr. A. G. Jones was the architect, and Mr. John Nolan the builder.

The corner stone of a new Baptist Chapel at Bolton, was laid on Wednesday afternoon, by T. Barnesley, M.P. The chapel will be built in the Italian style of architecture. It will accommodate 1,000 persons, and the school 500 children. The architect is George Woodhouse, Esq., of Bolton, and the contractor Mr. J. Robinson, jun., of Hyde. The cost of the building is estimated at £5,500.

A new Roman Catholic Church is about to be built at Crosshaven, County Cork. Plans for the building were sent in by Messrs. Pugin and Ashlin, of Dublin, and accepted. The expenditure will be under £2,000, exclusive of spire, fittings, &c.

On Monday Sir John Heron Maxwell laid the foundation stone of a new United Presbyterian Church at Waterbeck, near Keithbridge, Dumfries. The church, which will accommodate 381 sitters, will be of the Early English Gothic style, and will be formed of nave and transepts. A manse is also in course of erection. The sites and the whole of the stone required for the buildings have been given free of charge, and the remaining cost is estimated at £1,868.

The works at the new Catholic Cathedral, Queenstown, have been begun to the extent of excavating for foundations and levelling the site. This portion of the work is being carried out by the architects, and when the foundations shall have been built up to surface level a contract will be entered into for the superstructure, which will be of considerable magnitude.

BUILDINGS.

On Friday last the foundation stone of the new City Police and Session Courts was laid at Manchester by the mayor. The building, which will be in the Gothic style, has been designed by Mr. T. Worthington, of that city.

On Monday the foundation stone of a new police-station was laid at Sunderland. It will comprise cells, &c., and lodging-room for officers. Mr. Younger, borough surveyor, is the architect, and Mr. Hepple, the contractor. The estimated cost is between £800 and £900.

TO CORRESPONDENTS.

Notice.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

Notice.—The BUILDING NEWS inserts advertisements for "SITUATIONS WANTED," &c., at ONE SHILLING for the first Twenty-four Words.

Received.—"Clamp."—E. P.—A. C. F. K.—C. L. E.—H. L.—S. P. C.—J. L.—I. P. S.—F. W. R.—R. H.—H. H. S.—I. I. and Sons.—C. G. D.—G. C.—I. T. B.—I. E.—I. T.—J. P. S.—W. C. F.—I. S. S.—W. N.—S. H.—G. G.—D. and T.—I. P. L.—W. R.

Re William Hey.—We shall be glad to refer to this case when "his honour's" decision is recorded.

D. C. L.—Your letter is inadmissible, though it contains many good points. We do not feel justified under the circumstances in inserting a communication which condemns with undue severity and possibly unjustly the editorial conduct of an able and responsible professional contemporary. Eagles don't like to pick out eagles' eyes.

W. H. T.—Letter and photos received. The building contains nothing sufficiently novel or good to justify a page illustration.

W. T., Truro.—Our article last week will give some of the desired information. Tall's apparatus is, we should say, as applicable for building a mansion as a cottage. Read the article again.

Correspondence.

SLOUGH CHURCH.

To the Editor of the Building News.

Sir,—Up to this date the competitors have not been apprized of the result of this competition, though you gave us their decision more than a fortnight ago. It would be highly satisfactory if you would give your numerous readers a copy of Mr. Christian's careful report in order that they might be able to see how far the final choice of the committee is in accordance with his judgment.—I am, &c.,

One of the Competitors.

July 11.

MODERN RESTORATION.

Sir,—In spite of continued remonstrances from the true lovers of Gothic art there is little sign of the decrease of the vulgar spirit of "modern restoration." True, we are not alone in the matter. Italy, who by her art traditions should scorn to countenance the practice of such imposition, goes far beyond us, and "restores" her buildings, colouring and defacing the modern parts to make them appear old. We have not yet begun that, we are at present content with the opposite anachronism of causing all old things to appear new. Of course we know architects are only partially to blame in the matter. The caprice of a client or a building committee must be humoured, or the architect's commission account will be scrupulously canvassed, and, what is of far more importance to him, his professional reputation held in very light esteem. Yet there are matters in which clients and committees seldom interfere, and for which consequently the architect must be solely held responsible. The opposite principles that guide true and false restoration have been seldom set forth more plainly than in a recent paper by Mr. James Fowler, F.S.A., on All Saints' Church, Wakefield, from which I extract them:—

1. Remove nothing save what is mean, paltry, or a sham; square pews, galleries, plaster, &c., in order to	1. Remove everything, no matter what, that is unsightly, or, if this cannot be afforded,
2. Expose freely whatever is the fruit of genuine original intellectual energy; then,	2. Hide whatever is out of fashion, peculiar, that does not match, or is of no use, and then,
3. Leave the latter as a sacred thing exactly as it is found, no matter how worn by wind and rain, or battered by ignorant persons or fanatics, merely guarding it from further dilapidation, if need be, by props and stays;	3. Without any false sentiment, whatever is broken, or bent, or bowed, or worn, or time-mark'd, chisel away, finishing afresh, so as to obtain an entirely clean and fresh surface.
4. Adding nothing save what is itself the fruit of genuine original intellectual energy.	4. Adding, according to taste and funds, conjecturally, mason's work and carpenter's work to order.

As Mr. Fowler truly says, the two columns are in themselves irreconcilable and uncompromising. True, the advocates of the second theory seldom state their views so frankly, but they are not a whit the less apparent in their works. And our worst charge against these men is that the mischief they do is irreparable. If they must prostitute art let them build their own buildings and fashion them to their hearts' content. We can some day remove them, or if not they will stand as monuments of warning to true artists. But when they attack our old buildings and obliterate the work and teaching of men to whom they are not worthy to be called successors we claim either the right of the strong to prevent or of the weak to complain. The evil by no means ends even here. The bad influence daily gains power over the minds of workmen. Architects know well enough now how difficult it is to find men able to enter into the spirit of ancient work and to deal tenderly with it. If, then, this lack of all individual art feeling be not only permitted but encouraged to assert itself, what other effect can be produced than the degradation of their minds and the exclusion from their work of all freedom and life.—I am, &c.,

E. J. K.

PRIZE COTTAGE DESIGN.

Sir,—I beg to thank you for illustrating my cottage plan in your paper. Enclosed I send you copies of four letters I have received from the Central Cottage Improvement Society, from which you can form your own opinion. I have received from them, at least, twenty other similar letters. The statements made by Mr. Fortescue are incorrect. The staircase, plans, or specification have not in any way been altered.

—I am, &c.,

J. T. Smith.

8, Windsor-terrace, The Grove,
Ealing, W., July 14.

[Copy].

Central Cottage Improvement Society, 37, Arundel-street, Strand, W.C., July 11, 1866.

PRIZE COTTAGE DESIGN.

Dear Sir,—I have the pleasure to inform you that the prize of ten guineas was yesterday awarded to you by the Council of this Society, provided that the estimate for the same is correct. (See *Award.*) Will you be so kind as to call on me to-morrow between two and four to make arrangements for carrying the plan into effect?—I am, dear sir, yours faithfully,

(Signed) H. Martin, Secretary.

Mr. J. T. Smith.

37, Arundel street, Strand, W.C., October 19, 1866.

PRIZE COTTAGE PLAN.

Dear Sir,—The Council have decided on delivering the prizes at a public meeting to be held at the Society of Arts as soon as Parliament assemble. Hoping this arrangement will meet your approval, I am, dear sir, yours faithfully,

(Signed) H. MARTIN, Secretary.

Mr. J. T. Smith.

37, Arundel-street, Strand, W.C., June 29, 1867.

Dear Sir,—I have just received yours of the 26th inst., and as Mr. Hill will now carry out the plan as desired the difficulty is over. The Council will meet here on Tuesday, at three o'clock, when you may attend and arrange about the premium.—Yours respectfully,

(Signed) H. MARTIN, Secretary.

Mr. J. T. Smith.

37, Arundel street, Strand, W.C., October 1, 1867.

Dear Sir,—We have a council meeting next Tuesday afternoon, and if you will kindly send me by that day the undermentioned paper,* I hope we shall then be able to bring the prize cottage matter to a very satisfactory conclusion.—Yours respectfully,

(Signed) H. MARTIN, Secretary.

Mr. Smith.

* [Copy.]—Should this design be chosen in competition the architect will forward a detailed estimate with the builder's prices attached.

SIR,—I notice carefully your remarks, with estimate and specification, respecting detached cottages for labourers in your impression of July 3, and beg to enclose my card. Will you permit me to say I will undertake to build any number of them at £105 each within four miles of my address.—I am, &c., T. PEARSON.

Portland House, Bancroft-road, Mile End,
London, July 9.

Intercommunication.

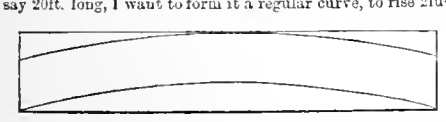
QUESTIONS.

[921.]—WORKMEN'S INTERNATIONAL EXHIBITION FOR 1869.—Some time since I saw in the papers that it was intended to hold a workmen's international exhibition in London in 1869. I have recently heard nothing about it. I should like to know whether the matter is abandoned or not, and if not, what progress has been made. No doubt some member of the council of the Working Men's Club and Institute Union, or some member of the council of the Public Museums and Free Libraries Association, could give the desired information.—W. B., Nottingham.

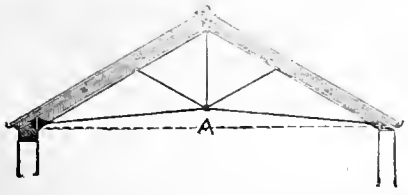
[922.]—UNINFLAMMABLE DEAL FIXTURES.—I write to ask if there is any of your intelligent readers who will be kind enough to inform me, through "Intercommunication," if there is any preparation that will render deal fixtures of a fireproof room less liable to take fire, or be less combustible? The shelves are to be filled with account books and papers.—EXONISIS.

[923.]—BRICKMAKING BY MACHINERY.—Will you or any of your contributors oblige by giving prices paid per thousand for making bricks by machinery (Porter's machine), including wheeling clay to machine a distance of 25 yards, and wheeling bricks from machine to stacks a distance of 50 yards, and backing; also prices for setting bricks into Hoffman's kiln for burning, exclusive of wheeling? The prices solicited are for labour only.—BRICKMAKER.

[924.]—ARCS OF DIFFERENT RADII.—The answer of "A. Z." to my query on July 3 not being satisfactory, I beg to put my question in another form, as I presume "A Z" did not understand my meaning. Having a beam, say 20ft. long, I want to form it a regular curve, to rise 2in. in the middle. Will "A. Z." or any of your readers inform me if there is any method by which a piece of wood ¾in. or 1in. square could be bent on surface of the beam, so as to mark the curve along the piece, as here shown?—HOWELL.

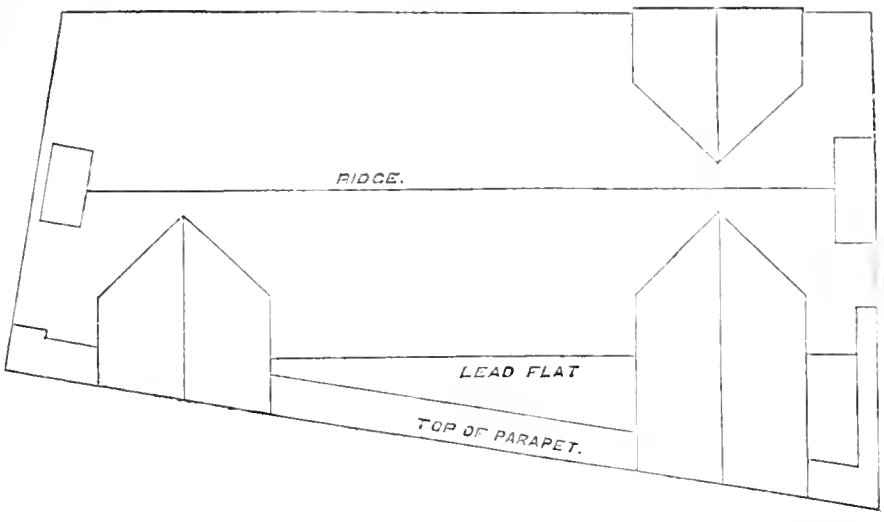


[925.]—SPAN ROOFS.—Will any of your readers kindly inform me what the effect of the undermentioned would be? I have a span roof of 29ft., but, instead of the ordinary tie beam, there is a 1in. tie rod, suspended by a 1in. ring bolt, as shown in the accompanying sketch. Now, what would be the effect on the tie rod if there was a weight (say one ton) suspended from it in the centre at A? Would it not be to bring the tie rod down until it was straight, and consequently to force out the feet of the principals? or, supposing the latter did not yield, would not the tie rod bend?—SUBSCRIBER.



[926.]—REMOVING OIL PAINT FROM STONE.—I am restoring a church, and some of the columns and all one wall are covered with thick coats of oil paint. I do not wish to resort to the detestable practice of chiselling down the surface of the stone, and so destroying all the traces of old work. Can anyone tell me how to remove this paint without injuring the stone?—E. S. B., York.

A TAPERING ROOF. (895.)



[927.]—HEARTHS.—Would you consider the specification of "slate hearthstones" correct or otherwise?—F.

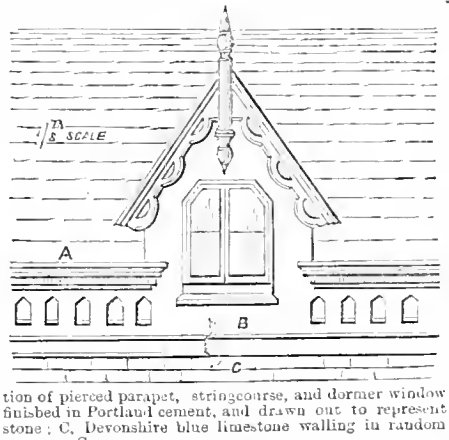
[If not strictly, literally correct, the phrase would be conventionally correct.]

[928.]—INSTITUTION OF SURVEYORS.—Will a member of the above kindly inform me, through your "Intercommunication" column, what benefit I shall derive from becoming a student in the above; also where the rooms of the institution are situate?—YOUNG SURVEYOR.

REPLIES.

[889.]—KAURI PINE.—Experience in the behaviour of this wood is limited in England. It is truly a beautiful wood, and but for its high price would undoubtedly become of general use. It is known with botanists as the *Araucaria excelsa*, or Norfolk Island Pine. It is a common wood in our Australian and New Zealand settlements, from whence it has been shipped to this country. There is no particular use to which it has been at present applied; and as it possesses neither colour nor beauty to recommend it there is a loss upon the imports. Logs of this timber are occasionally seen in London and Liverpool, and may be procured ninety feet long and a yard square. It has been used in Manchester and the cotton districts for printing rollers, in place of sycamore wood, and has been found to stand remarkably well. It is pale in colour, close in its texture, and remarkably straight in the grain; and is peculiar in having no turpentine in the heart wood, although it is abundant in the sapwood and bark. For flooring, I should consider it suitable; it would wear bright and hard, as do all our light soft woods, such as larch, sycamore, and horse chestnut. As a compact tenacious wood, the Kauri pine has few rivals; as a thin slice, if placed under a die, it will take and retain an impression in the same manner as soft metal or leather.—W. S., Nottingham.

[895.]—A TAPERING ROOF.—I have a roof of this kind in course of construction, and the annexed sketches will show the treatment I have adopted. A (in the elevation) is the parapet cornice, executed in red brickwork; B, portion of pierced parapet, stringcourse, and dormer window finished in Portland cement, and drawn out to represent stone; C, Devonshire blue limestone walling in random courses.—CLAMP.



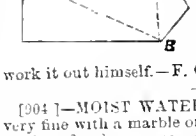
[898.]—WELL DIGGING.—For "A. B. C.'s" information, I venture to tell him that no man, to do himself or "A. B. C." justice, can give him a definite price for his work, for in neither of his questions does he say anything about the nature of the soil. This is an important consideration. It may require 14in., 9in., or 4½in. steining, or more, and these in cement; or it may do with only 4 in. dry work. The above, "A. B. C." will see, will very materially regulate the price of labour. And secondly, he does not say whether his 4ft. diameter is the diameter of earth or brickwork. "A. B. C." cannot do better, if he wants a good sound job made of his well, than to employ some respectable practical man.—W. W.

[900.]—BOLTED GIRDER.—"Peter," although so very sarcastic in his reply, has omitted the principal reason why a piece of timber cut down the centre longitudinally, and the two pieces then reversed, not only in the direction of the grain but also end for end, is considered preferable to the same piece of timber uncut. The main object of the above process being this, that should there exist a defect between the centre and one end we by it probably divide that defect between the two ends, so making the strength of the girder uniform at both ends.—F. C. H.

[900.]—"Peter" has palpably proved—to my satisfaction at least—that "prejudice and preconceived notions and ideas" *would* materially affect the strength of a girder. The argument of "having the grain of the pieces bolted running in opposite directions" as a means of securing additional strength I consider puerile. To a dead certainty, if the piece in its entirety is placed the strongest way of the grain, an argument of two to one in pieces, at least, is immediately secured; besides, the stronger half is not weakened by partially supporting the weaker; neither, again, has the whole to sustain the extra weight of bolts, or withstand the the weakening influence of holes necessary for the same. "What everyone says must be true" is an argument preeminently characteristic of aged females. The bolted girder is an erroneous and partially exploded notion, and, however readily *nobled* by "Peter," cannot certainly be so easily digested by many as by that worthy. I have re read my query carefully, and still fail to see the "sea of words" *salt Peter* is in such a "sea of troubles" about. If the *Blue Peter* is not "flying at the fore," I await a broadside.—F.

[901.]—VENTNOR HOSPITAL COMPETITION.—As the name of the successful competitor in the above did not appear in the last number of the BUILDING NEWS in answer to inquiry, it seems probable that no design was accepted by the committee. I sent in drawings, which "fell short of their requirements," and were consequently returned, together with a cheque for the amount of the first premium.—HUBERT BENSTED, Maidstone.

[903.]—CONTENTS OF CISTERN.—The answers to this query are very unsatisfactory. If "Inquirer" will give, in addition to the other measurements, the two, A B and C B, I will then furnish him with a correct solution of his question, and also the means by which it is arrived at, so that he can work it out himself.—F. C. H.



[904.]—MOIST WATER COLOURS.—Grind the colour very fine with a marble or glass slab and muller; do not use iron for the purpose, as its contact with some colours is injurious to them. Then mix to a proper consistency with a little honey.—F. C. H.

[913.]—IRON SEMICIRCULAR ROOF.—I think there cannot be any dispute as to the shape (theoretically) of these kind of roof, i.e., less deep at the crown than at the spandrel; but, in practice, I think "Calculator" is right in making the flanges parallel, as all the plates will be duplicates. But "Young Engineer" will find no satisfactory formula for these ribs. He may apply to any of our great professors, consult their works, burn the "midnight oil" to fathom the depths of their formula, and when day breaks still be in a fog. Therefore, to "Young Engineer" I would say, don't be disheartened, but do like many an "old engineer" would do under the circumstances, and copy from some existing work, such as the Great Western Railway terminus, at Paddington. Messrs. Handyside, who erected the semicircular roof at the Agricultural Hall, could no doubt give excellent advice on this subject, if "Young Engineer" were to apply. An engineering friend informs me that Phillips and Co., of the London Coal Exchange, have put up some of these kind of roofs.—NIL DESPERANDUM, Leicester.

[914.]—ETCHING GROUND.—The following is a good one:—1 part of black pitch, 1 of white wax, ½ of Burgundy pitch, 1 of asphaltum, 1 gum mastic. Melt the first three ingredients over a slow fire in a pipkin; add the other two finely powdered, stirring the whole well together; when well mixed, pour it into warm water, and make up while warm into balls. If too soft, use a little less wax. Be careful the mixture does not burn while melting.—E. J.

[915.]—DRY ROT.—The dry rot was in all probability inherent in the timber, and if so is probably not due to the formation of fungus, but to spontaneous decomposition. The remedy in this case is the use, if possible, of some substance as will, when penetrating the wood, combine with

its albumenous matter and solidify it. Corrosive sublimate, sulphate of copper, and arsenic acid have been found very efficacious. Nitric acid and sulphuric acid may be used with advantage, and especially where the growth of fungi is the cause of the rot, or where vegetation has followed decomposition, as it sometimes does.—W. R.

[915.]—Cut away the parts which are suffering, and repair with good material; at the same time look to the proper ventilation of the floors.—F. C. H.

[915.]—Wood is a light vegetable composition of a volatile nature, and if kept dry will last for a great length of time. Dry rot is a misnomer, and should be termed "wet rot," for it only exists in damp and humid places. If wood is placed against a damp wall, or used for flooring over a damp basement, it is sure to take the dry rot. Boards constantly damp will become mouldy. This mould is a fungus, and its food is the gaseous or volatile part of the wood, and will slowly consume it, leaving behind a charred powdery matter, which reminds you of the action of fire, or in other words, it leaves behind the mineral residue or ash. In some cases, where the floor joist or plinth blocks are dry, the boards take the dry rot between; in other cases, where they are damp and dry air is made to circulate under the floors, the dry rot will only seize upon that part which is fixed to the damp wood. Dry rot, as a rule, is not inherent in the wood, but is the natural result of the position in which it is placed. To cure the dry rot, you must take the moisture from the plant, and death will ensue. Ventilation (with dry air) is the only certain cure, but this is not always practical. Damp courses should be placed as much below the level of the timbers as possible, and the air in the basements or between the ground and the sleeper floors should not become stagnant; a good layer of dry rammel, or lime scraps, should be laid over the ground to prevent vegetation on the surface; such low forms of vegetation as mould engender dampness and so communicate its destructive influence to wood or other vegetable composition within its reach. Perhaps the best illustration of the "dry rot," may be given in a post fixed in the ground. That part above the ground, although wet at intervals, will remain sound, as will the lower portion, which is excluded from light and air, but the part level with the ground which is well supplied with moisture and air will rapidly decay. This portion is alive with fungi feeding upon the vitals of the wood; the sap, which is alive to all vegetable influences, is the first to be seized and then follows the heart wood. In pure and soft woods its progress is rapid; but with oak, yew, and other hard woods time must be called to aid this feeble plant in its work of destruction.—W. S., Nottingham.

[916.]—STAINING WOOD.—"X. P." can stain deal to a mahogany colour as follows:—Dilute aquafortis with an equal quantity of water, and add double the quantity of the mixture of archil. Lay it on as thin as possible, and when dry oil and polish.—K.

[916.]—To stain deal a mahogany colour, first rub the surface with dilute aquafortis; then dissolve one ounce of dragon's blood in a pint of spirit of wine by heat; and add one third of an ounce of carbonate of soda. Filter the above mixture, and lay on twice with a soft brush, of course allowing first lay on to dry previous to applying second time.—F. C. H.

[917.]—FASTENING ZINC ROOFING.—If "Inesport" will call here he can inspect the different methods of fastening of Messrs. Braby, Tyler, and Fox, and I shall be happy to explain them to him.—CURATOR, the Museum of Building Appliances, 23, Maddox-street, Hanover-square, London, W.

[917.]—In your "Intercommunication" column in last week's paper I find an inquiry as to the best mode of fastening zinc roofing. I beg to enclose a printed sheet, with illustrations at the back; but I fear the matter is too long for you to publish, so perhaps you would have no objection, in the event of not publishing the sheet, to refer the inquirer to this office, and we will forward every information to him.—JAMES S. EDMESTON, 5, Crown-court, Old Broad-street, E.C.

[920.]—RUBBING MONUMENTAL BRASSES.—The best plan is to cut away the margin, and then mount the rubbing on a clean piece of paper.—F. C. H.

WAGES MOVEMENT.

A STRIKE has taken place on the Alps. The labourers engaged in piercing the Mont Cenis tunnel struck work the other day at Bardonneche for an increase of wages. No acts of violence were committed, and it is hoped that an arrangement will be come to.

The advance of wages demanded by the Stockport bricklayers, at two days' notice, and resisted in April last, has been conceded.

The Sunderland ship joiners a fortnight ago gave notice of their intention to seek for an advance of 6d per day in order to raise their wages to the same amount as the shipwrights, 30s. per week. At a meeting held in their union room, on Friday night, 3rd inst., they determined to withdraw that notice at present, as there are many men out of employment in the trade.

STATUES, MEMORIALS, ETC.

MR. FOLEY is engaged on a statue of the late Prince Consort, for the Hyde Park Memorial, in place of that modelled by Baron Marochetti, which failed to satisfy the committee, and has been destroyed.

STAINED GLASS.

MESSRS. BEER AND SON, of Exeter, have just completed a new chancel window for Broadwood Kelby church, in that town. It is of three lights, and is in the Decorated style. The subjects are the True Shepherd, and St. Peter and St. Paul.

The Whitworth exhibition placed at the disposal of the Clifton College, has been awarded, after an open competition, to Mr. J. Bush, of Cardiff. Nine candidates competed for the exhibition.

LEGAL INTELLIGENCE.

WILFUL DAMAGE.—Last week, at the Marylebone Police Court, Edward Neal, a labourer, was charged with the following wilful damage. Samuel Wright, foreman to Thirsk and Co., builders, Chelsea, said, a few days ago the prisoner applied to him for employment on some buildings in Maryland-road, Paddington. He set him on. On Wednesday morning he disputed about his wages being only 4½d. an hour, the best labouring hands being paid 5d. The prisoner left, and said he would have it out. On return from dinner he found a quantity of brickwork thrown down, doing damage to the amount of £6. Evidence was adduced to prove the offence, and the magistrate committed him for trial.

ALLEGED SEWAGE NUISANCE.—ATTORNEY-GENERAL v. THE COLNEY HATCH LUNATIC ASYLUM.—This information was filed at the relation of the officer of the Local Board of Health at Edmonton, against the defendants for an injunction to restrain them from permitting any sewage or gas water to pass into a stream called Pymm's-brook, so as to be a nuisance injurious to public health. The plaintiff's case was that ever since the establishment of the asylum the flowing of the sewage from it had been such a nuisance as to produce remonstrances from the relators and the public, met by promises of amendment and ineffectual attempts to remedy the evil, by deodorisation, filtering beds, or otherwise, the River Lea being at the distance of several miles, and the brook flowing into it. To this it was answered that if there was a nuisance, it arose chiefly from houses and other sources, and that all that could be done by the filtering beds and use on the farm was done. The case was originally brought before Vice-Chancellor Wood and transferred to this court, and the motion for injunction turned into motion for decree. The Vice-Chancellor now recapitulated what had occurred, and under the power given to the Court by the 42nd section of the 15th and 16th of Victoria, cap. 80, directed the cause to stand over, with a reference to Captain Galton, the well-known engineer, whether it was necessary and proper, having regard to the health of the inhabitants in the district in which the asylum was situated, that any and what steps should be taken for purifying the drainage from the asylum as it now flowed into the brook; or, whether it was necessary and proper that the same should be diverted from the said stream, and if so, by what means such diversion could be made. This order could be appealed against as if it had been a final decree.

Our Office Table.

A correspondent, writing from Exeter, says that many tube wells have been sunk in the neighbourhood, in gravelsubsoil, of slight depth, and have answered admirably.

On Saturday last Vice-Chancellor Giffard dismissed the petition for winding up the Suburban Village and General Dwellings Company. The directors have now obtained an estate at Loughborough Park from the Ecclesiastical Commissioners, and operations will be commenced forthwith.

There is a statement in Constantinople that the Sultan proposes to appropriate a part of the gardens of the seraglio to the central railway station. Thus, where the Bostanji Pashi cut off heads in his fatal kiosk, the modern Pacha will be able to ticket for an excursion train, instead of taking an excursion to the other world, as his predecessors too often did.

A fine fresco has just been discovered in the church of Santa Maria del Giardino, Milan, which is now being demolished. This fresco, which is in a good state of preservation, represents St. Antonio of Padua, and is attributed to the painter Suardi.

The Metropolitan Board have accepted the tender of Mr. Strickson for the carrying out of the plan for the formation of the ornamental portion of Finsbury Park. The plan is that of Mr. M'Kenzie, with certain modifications recommended by the committee. The amount of Mr. Strickson's tender is £4,500. The other tenders were considerably higher, one being as much as £12,550.

The Exeter Freehold Land Society have quite recently laid out 30 acres of land for building over 300 houses. Every allotment has been taken up by the shareholders and others, who have already begun from 40 to 50 houses on the estate.

Lancaster has been fixed upon this year for the annual congress of the Royal Archæological Institute of Great Britain and Ireland. The inaugural meeting takes place on the 28th inst., and the congress will sit until August 4 Colonel Wilson Patten, M.P., Chancellor of the duchy of Lancaster, is the president, and the programme of the week's proceedings has been thus arranged:—On Tuesday, July 28, the inaugural meeting will be held in Lancaster Castle, and on the same day the principal objects of antiquarian interest will be visited. A reception will be held by the Mayor of Lancaster in the evening. On Wednesday morning there will be a meeting of sections, and an excursion to Heysham. Papers will be read in the evening. On Thursday the great excursion of the week will take place to Dalton Castle, Peel Castle, and Furness Abbey, where a lecture will be delivered, and the ruins described, by E. Sharpe, Esq. The Mayor of Barrow in Furness also gives a *dejeuner*. On Friday there is again a meeting of sections, and more excursions, and so again on Saturday several excursions to localities of interest in the neighbourhood are proposed. On Monday, August 3, there will be an excursion to the far-famed Bolton Abbey, Barden Tower, and Shepton Castle; and on Tuesday, the final meeting will be held, and papers will be read in the sections. Excursions are also projected to visit the Art Treasures Exhibition at Leeds in the course of the week.

Mr. B. Haughton, President of the Civil and Mechanical Engineers Society, writes us to say that besides assistant engineers and pupils for whose benefit the society was established, it is "largely patronised by men who practice engineering on their own account."

The usual quarterly meeting of the Exeter Diocesan Architectural Society was lately held. The report and treasurer's statement for 1867 were read and adopted. Since January, 1866, nine grants in aid of various buildings have been made by the society, payable when the work has been completed, according to approved plans. The financial position of the society is very fair. The report and statement were unanimously adopted.

A novel opportunity for the introduction of "arbitration and conciliation" has arisen at Ledbury, in Herefordshire. The organist of the church struck for wages on Sunday last, and positively refused to play until his demand for a rise was agreed to. In consequence of this resolution the congregation had to conduct their devotions without music.

The junction of the two Temple gardens is contemplated in connection with the improvements in progress on the Thames embankment.

The great success which has attended the adoption of the principle of arbitration upon the method of Mr. Rupert Kettle was celebrated in Wolverhampton, on Monday, after quite a jubilant fashion. Arbitration is practised in that town by the carpenters, the plasterers, and the bricklayers, but not yet by the masons and the labourers. Mr. Kettle had remembered with much pleasure the annual holidays of the operatives in the French towns, and at the last arbitration meeting he suggested that some such yearly holiday should take place in Wolverhampton, masters and men and their families cordially fraternising during the festivities. The suggestion was taken up, and yesterday "the first annual demonstration in commemoration of the adoption of the principles of arbitration as a medium for the settlement of trade disputes," as the bills term it, came off. The occasion was made a general holiday throughout the building trade there, the masters having closed their shops for the purpose. The proceedings comprised dinner, tea, and ball, music throughout the day, and the throwing open of the grounds attached to the residence of the arbitrator. At dinner the Mayor of the borough presided, and amongst the speakers were the Earl of Lichfield, Sir John Morris, Mr. Kettle, and others. Every exertion was used to make all feel at home in the somewhat novel position in which both sides found themselves, and the result was a thorough success.

The Kensington Vestry have adopted the sensible plan of watering the principal roads of the parish on Sundays.

The Westminster Board of Works have been obliged to call upon one of the dust contractors to give up his contract in consequence of his not carrying it out properly; and the contract of the whole district has been given to Mr. Cookson, who is to receive £595.

The following is the return of admissions to the National Exhibition of Works of Art, at Leeds, for the week ending the 11th day of July, 1868:—By season tickets, 5,787; by payment, 18,243. Total, 24,030.

It is expected that the Royal Academy will take possession of their new quarters at Burlington House by Christmas. It is stated that Mr. Horsley has promised that the first use of the new apartments shall be to hold an exhibition of the works of members of the Academy from the earliest times.

Trade News.

TENDERS.

BROMLEY.—For house and offices, Bromley, Kent, for J. A. Allsop, Esq.—Mr. C. H. Driver, architect, Quantities supplied by Mr. R. O. Harris:—

Gammon and Sons	£1937
Arnaud	1837
Payne and Balding	1835
Nixon	1855
Perry	1834
Taylor	1797
Nutt and Co.	1759

CARDIFF.—Cardiff Arcade, first contract for 24 shops and offices. Mr. Peter Price, architect. Quantities supplied:—

Webb	£3850
Price	3840
Stride	3765
Shepton	3550
Lock	3196
Seager	3040
Eassie and Co.	2976

EALING.—For the erection of a new Wesleyan chapel at Ealing. Messrs. J. Tarring and Charles Jones, architects. Quantities supplied:—

Brown	£6950
Myers and Son	6189
Adamson	6141
Kilby	6089
Chamberlin	6049
Dove Brothers	6009
Higgs	5862
Saunders	5840
Nye	5769
Hill	5670

HANWELL.—For the erection of a new Congregational church at Hanwell, Middlesex. Charles Jones, architect. Quantities supplied by Messrs. Richardson and Waghorn:—

Waters	£1833
Adamson	1793
Myers and Son	1789
Nye	1696
Hanson	1640
Gibson Brothers	1630

LONDON.—For alterations and repairs at 52 and 53, Margaret-street, Cavendish-square, for William S. Gard, Esq. Mr. Charles Bradley, architect:—

Longmire and Burge	£877
Haward Brothers	840
Hyde	792
Brown (accepted)	775

LONDON.—For various reparations to the parish church of Christ church, Newgate-street, E.C. Mr. H. H. Collins, architect and surveyor:—

James Pitcher	£497	10	0
George Shaw	366	0	0

NEW BARNET.—For the erection of a pair of villas, Victoria-road, New Barnet. Mr. I. Sargeant, architect. Quantities supplied:—

Bamberg	£1100	0	0
Twelvetrees	899	0	0
Binto	835	0	0
Glener	831	0	0
Hayley	827	12	6
Ginger	827	0	0

STROOD.—For new church, St. Mary's, Strood, next Rochester. A. W. Blomfield, Esq., M.A., architect:—

Browne and Robinson	£6675
Vaughan	6452
Stump	6446
Wallis	6356
Hill and Sons	6328
Wheeler	6300
Anscomb	6293
Foord and Sons (accepted)	6083
Futcher (withdrawn on account of error)	5099

COMPETITIONS.

LINCOLNSHIRE (LINDSAY).—Extension of time till September 1.—Plans for the erection of a gaol and house of correction. J. H. Holloway, Clerk of the Peace, Spilsby.

FINSBURY SCHOOL DISTRICT.—August 3.—Plans, sections, elevations, and estimate of costs for school at Upton, West Ham, Essex. W. W. Hayne, Vestry hall, City-road.

HERTFORD COTTAGE PRIZE COMPETITION.—Sept. 1.—Design for model cottages for agricultural labourers. Premium, £20. R. Dimsdale, Esq., M.P, 9, Queen-square, Westminster.

CONTRACTS OPEN FOR BUILDING ESTIMATES.

CITY OF PEST.—July 31.—For excavating trenches, laying the pipes, and making them entirely watertight. H. n Moritz von Szentkirályi, Ober-Bargermeister, President, City Waterworks Company, Pest.

ROYAL ARSENAL, WOOLWICH.—August 1.—For supplying and depositing dry rubbish or dredger stuff on the foreshore. Inspector of Works, Royal Arsenal.

HERTFORD.—July 20.—For taking down and rebuilding St. Andrew's Church. Architect, Mr. J. Johnson, 35, Moorgate street, E.C.

CHESHIRE NEW COUNTY ASYLUM.—July 27.—For the erection of the above-named building. R. Griffiths, Martin-street, Stafford.

LEICESTER.—July 21.—For laying about five miles of cast-iron socket pipes. J. E. Williams, secretary, Leicester Waterworks Company.

ST. IVE'S, HUNTS.—August 6.—For supplying and lighting the streets, roads, and other places with gas, for a period of three years. Messrs. Fisher and Ginn, clerks to the Improvement Commissioners, St. Ive's.

CROYDON.—July 28.—For the construction of about four miles of brick sewer, and one mile of earthenware pipe sewer. R. J. Cheesewright, Townhall, Croydon.

MAIDSTONE.—July 28.—For 400 tons broken Guernsey granite. E. Hoar, clerk to the board, Maidstone.

INDEPENDENT GAS LIGHT AND COKE COMPANY.—July 15.—For the whole of the tar produced on their works. J. B. Coulson, 236, Kingsland-road.

BRIGHTON.—July 30.—For the construction of about 4,000 yards brick sewers, and about 22,000 yards pipe sewers. D. Black, town clerk.

BATH.—July 23.—For the supply of glazed stoneware sewage pipes for twelve months. Mr. A. Mitchell, 3, Fountain-buildings, Bath.

METROPOLITAN BOARD OF WORKS.—July 20.—For the erection of a fire brigade station in Renfrew-road, Lower Kennington-lane. J. Pollard, clerk, Spring-gardens.

GRANTHAM.—July 24.—For the purchase of the whole of the materials except bricks and rubble-stone from the old Guildhall and Prison. W. Thomson, 11, Elmer street, Grantham, and W. Eve, 10, Union Court, Old Broad-street, E.C.

WISBECH (CAMBRIDGESHIRE).—Cattle Market.—For wrought and cast iron cattle pens, fencing, &c.; and for paving, draining, &c. F. Jackson, clerk to Local Board.

TOTNES.—July 23.—For altering, enlarging, and refitting the north aisle of the parish church. Mr. G. G. Scott, architect, 21, Spring Gardens.

KINGSTON.—July 27.—For the enlargement of the workhouse in Coombe lane. Plans at Messrs. Ruckworth and Luck, Carlton Chambers, 12, Regent-street.

NELSON.—July 24.—For the supply of about six miles in length of cast iron pipes and other castings. Specifications at Messrs. Cowley and Newton, C.E., Carlton Buildings, Manchester.

BEACONSFIELD, BUCKS.—July 30.—For altering, repairing, and part rebuilding the house, &c., at Hall-place. Plans, &c., Rev. S. J. Bowles, Rectory, Beaconsfield.

HALIFAX.—August 11.—For proposed new infirmaries, fever hospital, &c., at the Halifax Workhouse. C. Barstow, Clerk to the Guardians.

CAVERSHAM, NEAR READING.—July 30.—For the erection of a wrought iron lattice girder bridge over the Thames. Mr. H. Woodman, borough surveyor, 3, Grey Friars-road, Reading.

FARNBOROUGH STATION.—July 27.—For works and repairs at Royal Military College. Lieutenant Colonel C. B. Ewart., Royal Engineer Office, 11, James strert, Buckingham gate.

WAR OFFICE, PALL MALL.—August 10.—For the purchase of a turret clock. T. Howell, director of contracts.

SPILSBY (LINCOLNSHIRE).—August 1.—For taking down and rebuilding the George Hotl. G. Smith, surveyor, Spilsby.

WEST HAM LOCAL BOARD OF HEALTH.—July 27.—For the construction of a wrought iron lattice girder bridge.—July 27.—For the construction of about 2,700ft. of pipe sewer. C. Wilson, Rokebo House, Stratford.

PROPERTY SALES.

JULY 7.

AT THE MART.—By Messrs. Driver and Co.—Freehold 4a. 1r. 36p. of building land fronting Hitchen-hatch lane, Sevenoaks, Kent—sold for £1,066.

Freehold 3a. 0r. 20p. of building land, situate as above—£1,460.

Freehold and leasehold property, known as Forest Lodge, in the parishes of Rogate, Bramshott, and Thelton, Sussex, comprising a residence with pleasure grounds, cottages, and land, nearly 35 acres, together with the manor of Rogate Bohnut, comprising about 531 acres—£5,700.

Freehold estate known as Bramblys, Basingstoke, Hants, comprising a residence with stabling, pleasure-grounds, offices, and 17a. 1r 9p. of land, also Brambly's Cottage, and three cottage tenements—£5,000.

By Messrs. Farebrother, Clark, and Co.—Freehold 2a. 3r. 3p. of building land, part of the Grove Meadows, Muswell Hill, Hornsey—£2,500.

Freehold property known as Colham House, Colham Green, Hillingdon, Middlesex, comprising a residence with stabling, farmery, farm yard, pleasure-grounds, and land, 4a. 2r. 12p., also the reversion to four cottages—£2,400.

By Messrs. Debenham, Tewson, and Farmer.—Leasehold residence with garden and grounds, known as the Hermitage, Southgate, Middlesex, term 12 years unexpired at £55 per annum—£660.

By Mr. J. A. Smith.—Leasehold two cottages, Nos. 4 and 5, Wilson's road, Great Church-lane, Hammersmith, producing £42 18s. per annum, term 90 years from 1866, at £7 per annum—£205.

By Mr. Saffell.—Freehold residence, No. 4, York Villas, Albion-road, Stoke Newington, annual value £70, also builder's premises attached, let on lease at £60 per annum—£2,305.

JULY 8.

By Messrs. Norton, Trist, Watney, and Co.—Freehold plot of building land situate at Muswell hill—£70.

By Messrs Edwin Fox and Bousfield.—Freehold pleasure farm, comprising about 124 acres, with residence, pleasure garden, and buildings, in the parish of North Benfleet, Essex—£8,200.

Leasehold residence with stabling, known as Mansfield House, St John's Wood, term 77 years unexpired, at £12 per annum—£1,805.

Leasehold residence, No. 52, Ellington street, Barnsbury Park, let at £70 per annum, term 84 years unexpired, at £8 per annum—£510.

Leasehold four houses, with shops, Nos. 45 to 48, Addison-road, North, Notting hill, producing £195 per annum, term 81¼ years from Midsummer, 1868, at £9 each per annum—£2,020.

Leasehold two residences, Nos. 7 and 9, Winchester-road, Willesden lane, Kilburn, annual value £100 each, term 92 years unexpired, at £10 each per annum—£915.

JULY 9.

At the Mart.—By Mr. H. Haines.—Leasehold six houses, Nos. 112, 114, 116, 118, 120, and 134, East street, Walworth-road, producing £168 18s. per annum, term 18¼ years from Midsummer, 1867, and 28 years from Lady-day, 1814, at £11 10s. per annum—£500.

At the Guildhall Coffee-house.—By Mr. Marsh.—Absolute reversion to two third share of the house and shop, 8, Bishopsgate-street Within, expectant on the decease of a lady in her 63rd year—£600.

Leasehold residence, No. 1, Melbury-street, Harewood-square, let on lease at £80 per annum, term 83½ years from 1825, at £16 6s. per annum—£700.

By Mr. Wagstaff.—Freehold three residences, Nos. 2 to 4, Alma-road, St. Paul's-road, Canonbury, producing £152 10s. per annum—£2,350.

At Garraway's.—By Messrs. Stocker and Winstanley.—Freehold property, known as the Nevendon Hall Estate, in the parishes of Nevendon and Basildon, Essex, comprising a residence and about 72 acres of arable, meadow, and wood land—£4,050.

JULY 10.

At the Mart.—By Messrs. Norton, Trist, and Watney.—Leasehold house and shop, No. 44, Aldersgate street, let at £75 per annum, term 21 years unexpired, at £21 5s. per annum—£500.

By Messrs. Rushworth, Jarvis, and Abbott—Freehold timber yard, stable, and sheds, fronting Trinity-street, Rotherhithe, let on lease at £10 per annum—£260.

Freehold house, No. 45, Trinity-street, let on lease at £15 per annum—£200.

By Mr. Frank Lewis.—Absolute reversion to one-eighth share of the sum of £2,425 New Three per Cent. Annuities, receivable on the death of a lady aged 65 years—£100.

By Messrs. Baker and Sons.—Freehold about 5½ acres of land, situate at Harrow on the Hill, Middlesex—£1,050.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

William Hooker, Croydon, plumber, July 24, at 12—George M'Kerness, Forest Gate, builder, July 21, at 1—Richard Roper, New Cross, and Cubitt Town, house decorator, July 21—William Francis Shephard, Woodford, bricklayer, July 22, at 1—Charles Church, Clarkson street, Bethnal green, builder, July 29, at 11—William Robins, Reform-street, Holloway, builder, July 30, at 1.

TO SURRENDER IN THE COUNTRY.

Benjamin Bottomley, and George Spenceby, Halifax, stonemasons—Charles Davis, Castle Gresley, Derbyshire, builder, July 27, at 11—John Goodall, Stapenhill, Derbyshire, journeyman brickmaker—Thomas Guest, Gornal Wood, near Sedgley, field carpenter, July 23—Jonathan Labram, Northampton, builder, July 18, at 10—Benjamin Lewis, Trecynon, Glamorganshire, contractor, July 21—James Marshall, Hull, builder, July 22, at 12—William Cockram, Witheridge, Devon, carpenter, July 29, at 10—Robert Fearns, Ormskirk, painter, July 24, at 10—George Smith, Thurcaston, Leicestershire, carpenter, July 25, at 10—Robert Smith, Britton Ferry-road, near Neath, mining engineer, July 28.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

August 1, S. Jones, St. James's-place, St. James's-street, house decorator—August 14, T. Borras, Ransford-place, Rotherhithe brick merchant—August 28, E. Hughes, Bushwick, Worcestershire, builder—July 23, G. Griffiths and W. Evans late of Llandudno, builders—August 5, J. Lea, Balsall-heath, builder August 12, F. Woodward, Swindon, builder—August 12, T. Moorcroft, Stapenhill, Derbyshire, carpenter—July 22, W. Daw, Plymouth, carpenter—August 5, W. Munro, South Sea House, Threadneedle-street, railway contractor—July 29, H. Colton, Stratford, carpenter—August 4, D. Higginbotham, Undercliffe, Yorkshire, plumber—July 29, A. S. Butler, Smethwick, plumber.

PARTNERSHIPS DISSOLVED.

Piper and Wheeler, Bishopsgate-street, builders—Jones and Firth, Bradford, painters—South Bank Iron Company, Eston Junction—Elwon and Malcolm, Eston Junction, ironmasters—Hewitt and Co., Coventry, engineers—Wynn and Brown, Portsmouth, engineers—Lewis and Alston, Preston, consulting engineers—Poulter and Co, Waterloo-street, Camberwell-green, varnish makers—Dickinson and Robinson, Huddersfield, brass founders—Engel and Co., Gresham street, zinc merchants.

DIVIDENDS.

July 22, Sir S. M. Peto, Bart., E. L. Betts, and T. R. Crampton, Great George-street, Westminster, contractors and builders—July 22, Sir S. M. Peto, Bart., and E. L. Betts, Great George-street, Westminster, contractors and builders—July 22, Sir S. M. Peto, Bart., Great George-street, Westminster, contractor and builder—July 22, E. L. Betts, Great George street, Westminster, builder and contractor—July 22, T. R. Crampton, Great George-street, Westminster, contractor and builder—July 28, G. Gale, Sherborne, builder—July 21, C. Howell, Liverpool, slate dealer.

DECLARATION OF DIVIDENDS.

W. Hay, Rockingham-street, Newington-causeway, architect, div. 20s.

SCOTCH SEQUESTRATION.

William Kinghorn, Glasgow, joiner, July 17, at 12.

THE BUILDING NEWS.

LONDON, FRIDAY, JULY 24, 1868.

DEVELOPMENTS OF NONCONFORMIST CHURCH ARCHITECTURE.

TO see clearly what one wants and why it is wanted is the first condition of lasting success everywhere. Nothing permanent can be gained by following an indefinite object in a half-hearted way. Now the singularly shallow and unreal character of much architectural progress among Nonconformists suggests the inquiry whether there is not some first cause of failure here. Have they ever fairly gone to the bottom of the subject, and decided why art is to be desired at all in connection with their worship, how far it may go, and in what direction? May it properly go as far as in a mediæval cathedral, or no farther than in a Quaker meeting-house, or where and why should it stop between the two? When, in short, utilitarian ends have been reached, is it right to spend money at all for the mere sake of dignity and beauty? These questions lie at the very basis of the matter, and influence its treatment more, perhaps, than those who pass them over are aware. The half apologetic tone with which "unnecessary" outlay is still spoken of shows that theory and practice here do not always go together. The old belief has long died out; the new one—if one has been formed—has hardly found expression yet. It is not as temples of the Deity that Nonconformist churches at any rate are built. No faith in their special sanctity gives a motive for investing them with grandeur; and thus the leading principle which governed Jews, Pagans, and Catholics alike has wholly vanished. But is excellence no longer to be desired except for what it will bring? Is it only to be coveted that it may attract a congregation and appear respectable? If so, we may as well cease to look for it; it is not to be won by those who seek it thus.

It is, of course, beyond the province of an architectural writer to show on what principles Protestantism may consistently ally itself with the arts. But that such principles urgently need to be understood, is, perhaps, of all facts, the one which most forces itself on his notice. There is no purpose, no reality, no thoroughness in the present system. A kind of latent feeling that this artistic development may be at bottom indefensible—that it needs excuses—that, after all, it is somehow at variance with the groundwork of Nonconformity—paralyzes every effort. It is not in this hesitating spirit that anything great can be done. This divided mind—swayed one way by the instinct for beauty, and the other by dogmas which seem to contradict it—leaves its own likeness on its works. The case is worth the study of the thoughtful and original of the class chiefly concerned, and to them we leave it. Two or three points, however, are clear enough. First, art is, essentially, a reservoir of *force*. Its main aim is not, and never was, to teach. It may have tried it once, but its strength did not lie in this. Ever since men have had tongues, and far more since they have had printed books, there have been readier ways of stating facts than by representing them in painting or sculpture. The highest use of these—the use of poetry and music and architecture—is to transmit energy, not knowledge; to call forth the motive power for action, to arouse the feelings and the will, and raise the soul to that glowing heat in which alone it receives durable impressions. Unless the forward impulse be too strong already; unless the present age is too enthusiastic for all worthy ends, and only needs the restraint of reason; we can hardly afford to neglect so powerful an agent. Again, those who talk of external influences as a trifle, contradict every day's experience. They *must* be felt, even in connection with our worship. The only question is, whether they shall be harmonious or discordant, elevating or debasing. People may doubtless be found so sublimely indifferent to externals, or so insensible by nature, as to borrow their hymn tunes from the music halls. Their practice does not commend itself to the general understanding, but it is precisely parallel with that which sanctions meanness and vulgarity in religious edifices. As to "unnecessary outlay," it would be hard to show why the cost of mental culture is more unnecessary than that of bodily comfort. Its object is infinitely higher, its results more widely spread and more lasting. Yet men who spare no expense for personal gratification and display cry out, "Wherefore is this waste!" over every building which makes a permanent addition to the beauty of the world.

It is assumed, then, that architectural excellence is worth having; that there are other grounds for it besides the tradesman-like one of its being attractive. But what form of excellence is possible in Nonconformist churches, and in what direction is it to be looked for? Where it is *not* to be looked for—in the imitation of buildings materially different in purpose—is sufficiently plain. The first necessity is that of honesty—thoroughness—distinct avowal of all the facts of the case, and scorn of all disguise. For a design even to become interesting, much less impressive, there must be a transparent simplicity and directness about it. The vulgar idea is just the opposite of this. To make a row of houses like a "plaster palace," and a galleried chapel like a church with nave and aisles, are what it takes to be triumphs of genius. The truth is, they are only the expedients of an unimaginative mind. The real artist would make his houses beautiful mainly by bringing out every feature peculiar to them *as* houses. In his galleried building he would emphasize above all things the galleried arrangement and whatever specially pertained to it. Far from seeking to hide away such characteristics, he would make them the salient points of his work—the problems he most delighted to study. In his hands they would be the germ of new forms of beauty; forms perhaps which no ordinary church would admit of. To him the difficulties of a feebler workman would be precious opportunities for something fresh and striking. It is only the man of no invention who is driven to mask new forms in the semblance of old ones; to copy and disguise because he cannot originate. And how wearisome is the monotony which his system produces, Belgravia and Bayswater may witness. Unfortunately, however, it is not confined to miles of stuccoed fronts in uniform patterns. Church architecture has had its full share of the curse, and Nonconformist architecture the most of all. Till it is freed from this, there is no possibility of its rising towards the perfection of which it is capable; and those who really wish well to its future will scarcely complain of any attempt to break the chains which are hindering its development.

The first principle to be applied, therefore, is one familiar enough in theory, however it may be forgotten in practice: that the leading forms of every building should naturally rise out of and express its purpose, its uses, and its structural requirements. These things in each case are among the terms of a problem which it is the architect's business to solve; his design should be the perfect solution of it. If the design does not thus solve it, but only to a careless observer seems at first sight to do so, it is not an honest or meritorious work in any sense. What, then, are the general uses, purposes, and structural requirements of a Nonconformist church? It is intended for worship, usually not liturgical—for worship of the simplest kind, almost devoid of ceremonial, and quite foreign to all ideas of sacerdotal power, and of the sanctity of places and things. To this worship, preaching is a most important adjunct. The preacher, too, must be heard distinctly from beginning to end of the service, not in the sermon merely—for the aid of a formal liturgy is wanting. The prominence given to preaching often makes it desirable to accommodate a very large audience, far larger than is usual in a parish church. When people meet chiefly for worship, and especially for worship in a prescribed and familiar form, there is nothing in that fact to make it preferable for them to occupy one large building rather than several smaller ones. But if the sermon becomes a chief feature in the service the case is entirely altered. As long as particular speakers have the power of attracting crowds to hear them so long large churches will continue to be needed by those who advocate preaching. There is, moreover, another reason for this enlargement. Amongst unendowed churches, such as those of Nonconformists generally, one large congregation works with far more ease and success than two or three of a less size. Every unit added to the congregation is an increase of strength without a corresponding increase of working expenses, and hence, if this were the only ground for it, the utmost practical accommodation would naturally be desired. For these reasons there is a certain point at which galleries become inevitable, and in practice they are commonly resorted to long before this point is reached. There is no difficulty in seating 1,500 or perhaps even 2,000 persons on one area, so as to bring them all within range of an ordinary voice. But it is so much cheaper to place a part of them in galleries, and they can thereby be grouped so much more closely round the speaker, that this extreme limit is seldom approached. Galleried buildings, then, are not likely to be altogether superseded. If they were, the great puzzle of Nonconformist architecture would be at an end. To design a one-storeyed church adapted for preaching in and artistically good is not an every-day performance, but it is easy compared with the other one. We will notice the hardest class first.

Probably the commonest of all forms of chapel, and a form so common that it seems almost typical, is that given at the head of our illustration. There are all sorts of slight variations on it, but the general principle is faithfully represented here. It is a wide, oblong building, with a pulpit or platform at one end, and a gallery at the other end and down both sides. If each side gallery contains three rows of seats, and a passage behind, it will of necessity be 12ft. or 13ft. wide. This being assumed, the width from wall to wall cannot be much less than 50ft., and would be better considerably wider. In much the most frequent arrangement, and the one to be treated of first, this span is covered by a roof unbroken on the exterior. The gallery columns may or may not be carried up to support it within. The side walls are generally low, for the sake of economy; the roof of any pitch, but frequently of a very steep one. The internal length is sure not to be great—about 80ft. will be a fair allowance for the width assumed. The general shape of building thus arrived at—which is that adopted in a very large number of cases indeed—is surely one of the most ungainly it is possible to conceive. Wide, short, and low, it is about as opposite in character to a mediæval church as anything can be. One may go further and say that it is about as destitute of beauty in form as any object can be. If economy forbids to it suitable height, and the least picturesqueness of skyline, let it have the grace to keep itself as much out of sight as possible. As an ugly piece of necessity it may, perhaps, be pardoned; till it altogether transforms itself it can never be admired. Unfortunately, however, the usual plan is to disguise some portion of it rather than to improve the whole. It is decided, perhaps, to make it Gothic—a very wise choice, for Gothic admits of the utmost freedom of adaptation, and shines in barns as well as in cathedrals. But there is a wide-spread notion among Nonconformists

that Gothic *must* be aspiring and vertical; and so, in spite of nature and facts, the aim is to make this galleried church look narrow and tall. But the main lines of a galleried building are inevitably horizontal; the roof, we are now assuming, is unbroken; and so begins the pursuit of "Gothic" under difficulties. The true course would be to remember that style should be modified by circumstances, not circumstances by style. There is no reason why a building should be made to appear specially vertical in character if its actual nature is otherwise. Make it honest and artistic first, and let it take its chance whether it suits the popular notion of Gothic afterwards. The architect's wisdom will be shown not in repressing but in developing the strongest tendencies of his subject. The custom, however, is too often to begin at the other end. To give verticality to the whole of such a building as that just described would, indeed, be an impossibility, but a lofty-looking front is easily contrived. The two elevations (figs. 3 and 4) show a common way of obtaining it. A turret is put over one of the gallery staircases, and a little bit of sham aisle over the other. In this way half the width is got rid of, and the centre gable runs up as tall and narrow as can be wished. But this arrangement can only exist for a few feet in depth. The barn-like chapel stands behind it in its native uncouthness—architecture does not extend so far back as that. A row of buttresses with windows between them may, perhaps, adorn its sides, or a few gablets may be added above, but when all this is done, two objects more totally contradictory in expression than the chapel and its front could hardly be brought together. Something more than decoration is wanted to bring two such discordant masses into harmony. The main building is heavy, wide, unbroken, and horizontal; the front is all breaks, angles, and vertical lines. The one is the extreme of utilitarianism and monotony, the other runs riot in its search for the picturesque. How can two such incongruous parts possibly make one harmonious whole? Does it really need argument to prove that a Gothic barn, with a slice from a small cathedral attached to one end of it, is not an admirable work of architecture?

It is true that a scheme for improving the form of the principal façade need not in itself be objectionable. It need not, and does not in all cases, contain so much of the element of sham as the instance just given. But the misfortune is that it so often absorbs all the care of the designer, while the real building is left alone as a subject too difficult to deal with. The same poor expedient, with trifling variations, recurs, it may safely be said, in two Nonconformist churches out of every three that are built. It seems as if they could not be contrived without it: as if this very easy device were supposed to meet all the difficulties they present. We have selected half a dozen out of an almost countless multitude of instances. They show different modes—some better and some worse—of reaching the same end, the narrowing of the front gable. This accomplished, further effort ceases. A "front" has been secured, which, from some one point of view, will appear fairly proportioned. The actual chapel is left in its native shapelessness—a "preaching-shed" with an ornamental end to it. It may be as plain as the chief elevation is elaborate, or they may both be adorned alike, but the striking discord between them is hardly more conspicuous in one case than in the other. In fig. 5 the narrowing is accomplished by bringing the centre of the building a few feet forward, and placing a tower on one side of it. In fig. 6 a lean-to roof covers the staircases at a low level. In 7 and 8 the staircases project beyond the chapel on each side, and have gabled and hipped roofs respectively. No. 9 employs a tower on one side and a turret on the other, as fit appendages to the barn behind; while No. 10 tries to keep it out of sight by two towers and an apse in the middle. Dozens of other slight variations might be found on this well-worked theme; but these are enough to illustrate the principle. Some of them, as 5 and 6, are harmless enough in themselves; others, again, might not be out of place in an elaborate and picturesque building, though verging on the ridiculous where they are. There is, of course, no reason why the staircases should not be made a distinctive feature in the building. On the contrary, it is much to be wished that they were treated more characteristically than they are. There is no special objection to putting them, in certain cases, in the angles of the front, and keeping their roofs above or below the main one. The absurdity lies in stopping here; in being satisfied with this easy expedient as the beginning and end of the external design. To take a building with the shape and proportions of a barn, and fancy that by putting a turret on each side of the front it becomes an architectural success, is almost too childish a notion to be seriously defended. Yet, as far as general design is concerned, this is all that is attempted with a great number of expensive and ornate Nonconformist churches. Is it not obvious enough that such "fronts" cannot be of a piece with the rest of the chapel: that they are out of keeping with it, and are, more or less, mere screens or disguises to it? The design is not treated as a whole, nor rendered satisfactory, as it should be, from every possible point of view. The difficulties of making a wide, low building effective are not really grappled with. They are only kept a little out of sight in the most conspicuous part, to appear, totally unconquered, everywhere else. But though this is the case, it would be quite unfair and absurd to put every instance of such a treatment on the same level. All grades may be found, from the cheap grandeur of No. 3 to the unobtrusive simplicity of No. 6. The latter is so plain throughout that want of harmony is scarcely, if at all, perceptible. In the former the contrast between back and front is almost as offensive as such a thing can be. The great want here is that of thoroughness. To carry the work through on one scale, to make it, whether more or less costly, honest and consistent in every part, is one of the most indispensable conditions of impressiveness in architecture. With buildings as with men, honour in the long run rests with those which will bear looking at all round, not with those which carry all their virtues in their face.

NATIONAL PRIZES, SOUTH KENSINGTON.

THE annual exhibition of models and drawings from the Local Schools of Art in competition for National Prizes is now on view in the competition room at the South Kensington Museum. The number of competitors is above the average, the figure of merit is rather below. The professional examiners for the year are Messrs. Maclise, Horsley, Westmacott, Redgrave, and Leighton, the official inspector being Mr. H. A. Bowler. The prize list includes ten gold medals, distributed as follows:—One medal for the best study from the antique in chalk or monochrome; one for the best study of the figure modelled from the antique; one for a group of still life from nature in colour; six for the best designs in three classes—architectural design, surface design, and plastic design; and one medal for a work of a class not included under these heads. Twenty silver medals are given to the second best works, and fifty bronze medals to meritorious works in any of the various subjects of study. Good boys also receive books. The influence of the grant annually voted by Parliament for the purposes of science and art, though not all that was expected, is greater than the exhibition of competing designs would lead many to imagine.

In many a village school the grant of one shilling for every child who gives satisfactory proof of having been taught drawing, an additional shilling for every child showing proof of proficiency, and another shilling for every child who may excel, represents much more than its money value. It is neither possible nor desirable to make artists of an entire population; but it is very important that everyone should be able to make an intelligible diagram or explanatory sketch with a piece of chalk or a bit of charcoal. If the art schools do nothing more than this they will have effected much. The space at the disposal of the authorities is not too great, and the drawings have to be hung on hinged screens; a consecutive arrangement has, therefore, not been perfected. The South Kensington authorities, for convenience, divide the branches of study into "stages," which are numbered. These we will proceed to notice, not in the succession of numbers, but in the positions they occupy on the walls or screens.

For modelling the human figure or animals, stage 19, the national gold medal has fallen to the lot of Edwin Mullins, Lambeth, carver. This is an *altorelievo*, almost equivalent to a detached statue. The gold medal has been well awarded. Edwin Mullins, carver, should, with ordinary fortune, become Edwin Mullins, sculptor, R.A. A model of the same subject, Hercules, in his Van Amburgh character, by W. Kirkman, age twenty-four, South Kensington student, obtains the silver medal. A student in the art of modelling would do well to examine these two representations of the same subject. The latter has more finish but less power, more modelling but less sculpture. Of the other statuettes little can be said. They are smooth as a worn-out cast hawked about the streets. A Venus of Milo, by Miss Caroline Nottidge, age twenty-two, South Kensington student, is the best of the unrewarded statuettes. Miss Ayres, of Bristol, student, contributes a bust of Clytie, and obtains the silver medal. Of the other specimens we can only say that they are so bad that it is to be regretted they should ever have been exhibited at all. A classical subject, by Alexander Stevens, of Lambeth, is the best. Stage 20—"Modelling fruits, flowers, foliage, and objects of natural history, from nature." Here we reach a very low degree of art. The modelling is very good, but is of no use when it is done. If a *fac simile* model of still life is wanted, there are many ways of obtaining it. Gutta percha is known to scientific men, isinglass can be bought in the market, and the plaster which is commercially known as gypsum can be procured. Why, then, all this modelling of dead ducks? A *fac simile* model of still life is an abomination. The specimens exhibited are a duck suspended by the heels, a partridge similarly placed, and a snipe. The additional water melon, pine apples, plums, grapes, and damsons are certainly round, and show modelling. In the days of our youth we were in the habit of making marbles, as they are called, of clay. These we rolled in our hands until they assumed a spherical form, when they were, by favour of the cook, allowed to bake at the kitchen fire. These products of art workmanship were never truly spherical, and for purposes of marble playing were valueless, in the same degree as these *fac simile* models of natural objects are valueless for art purposes. It will be enough to say that the national silver medal is given to a duck and game bag with a powder flask in the background. The artist is J. Henk, Stoke-upon-Trent, age twenty-one. The bronze medal falls to A. Bentley, age seventeen, Stoke-upon-Trent—the subject, a lot of vine leaves and grapes too much relieved. Any one can get a *cast* of a bunch of grapes or a few leaves. A realistic treatment of natural objects in this class is fatal to art. In fact, no artist ever so treats them. In this stage there are two panels by youths of Birmingham, aged eighteen—Messrs. Thompson and

Markland—which are well modelled. The drawings for architectural ornament are not up to the mark of last year. Mr. Paul Loocke, of Hull, aged twenty-one years, has obtained the gold medal. The stage is 12—"Painting ornament from the cast." His drawing is the best exhibited. The same subject, the "Trajan Frieze," by W. Sambrook, of Hanley, house painter, is nearly as well rendered. Mr. Sambrook obtains the national prize of books.

Prizes have also been awarded to Miss James, of Sheffield; Mr. J. Nunn, St. Thomas Charterhouse; James Brodie and Jared Reckie, of Edinburgh; and Mr. Boyes, of Bradford, for drawings of fruit and flowers suitable for architectural design. These are but copies, and show merely skill in drawing, none in design. Why not give prizes for wax models of the same? The mechanical skill is greater in the latter case, and the resemblance to nature is the closer. The bronze medal in this class falls to J. Robinson, of Edinburgh, aged seventeen. For the stage 16a, figure drawing from the cast, E. M. Bancroft, of Manchester, age twenty-one, subject the Laacöon, obtains the bronze medal—national bronze medal. Mr. J. Somers, eighteen years of age, Hull, obtains the national gold medal in stage 12a, which means a monochrome, either in oil, water colour, or tempera. In this neighbourhood may be seen about twenty examples of bad teaching gibbeted on a screen. The names of the masters of the local schools are not mentioned, but the lesson is supposed to be inculcated. A very bad lot of drawings are thus exposed. It is plain that no teaching can be worse, and the committee are right in exhibiting the results of the indifferent teaching which prevails in some of the local schools. Of these there are twenty examples, including drawings from the antique, portraits in oil, still life, and even lace patterns. Our limits will not permit, on the present occasion, a more extended notice, but next week we hope to review more fully the various objects in the national competition, more especially those which are connected with architecture and architectural decoration.

NATIONAL EXHIBITION OF WORKS OF ART AT LEEDS.

FIFTH NOTICE.

GERMAN, FLEMISH, AND DUTCH PAINTINGS.

IN Gallery C we have a large and important collection of the works of artists who may be classed as representing the above somewhat divided, yet united, schools of art—a group having a common sentiment, yet varying much in their individual modes of expression. Commencing with the works of John Van Eyck, in the earliest years of the fifteenth century, it extends itself through a long chain of artists down to the commencement of this, the nineteenth. Embracing occasionally some who, forsaking the traditions of their fatherland, have sought to impress upon it the generally predominant feeling of Italian art, their labours have been such as only to individualise their works, for the feelings of the Teuton and the Latin races have ever been so widely divergent that it has always been impossible for the same Art language to adequately express the ideas of both.

The school of Germany, for by this generic name we shall include them all, influenced very largely the history of art in Western Europe, and from it the early schools of both France and Spain derived much of their vitality, and to it our own owes its existence. Moreover, its principal distinction, that of painting in oil, changed the entire course of Italian art itself. Of the earliest efforts of this school we have nothing here, for of all early art expressions there is, as we have before remarked, a singular absence at Leeds, nor is it until we come to the establishment of oil painting as its chiefest medium, and the name of John Van Eyck as its chief exponent, that we find here any record of art growth amongst the Tenton nations.

The humid climate of Germany soon showed that the Italian mode of painting in tempera or fresco was unfitted for the decoration of its buildings, and that some repellent, rather than absorbent, medium was a vital necessity to the existence of the art itself. With the demand, as is ever the case, came its supply, and from the painting of woodwork to preserve it, and the search of siccative admixtures to enable this to be done quickly, the painting of pictures in oil arose, and amongst the most successful applicants of this new medium were the brothers Hubert and John Van Eyck. Hubert was an artist and a chemist, and to his training and experience John owes his instruction, for Hubert was twenty years his senior, and it is more owing to his greater opportunities than to his greater merits that the fame of the younger has eclipsed that of the elder brother. Being attached to the household of Philip the Good, Duke of Burgundy, by the title of his "varlet de chambre," and being employed by him not only in artistic but in diplomatic pursuits, John's reputation and knowledge were much increased, to the spreading abroad not only of his fame but also that of the German school of art.

To him three pictures here are ascribed, and there is but little doubt but that to two of these his name is rightly given; whilst the third has, from the days of Walpole down to those of Waagen, been accepted as a genuine example of this master. This doubtful picture (501) is called "The Installation of Thomas à Becket," and purports to have been painted for the Duke of Bedford, Regent of France, at the end of the reign of our Henry V. There is much in support of this tradition, for the Duke of Bedford was son-in-law to Van Eyck's patron, the Duke of Burgundy, and the picture bears upon its back the inscription, "Johes de Eyck fecit ano MCCCCXL, 30, Octobris," an inscription which, if true, would be very important, as giving the earliest date known of this artist's signed works. Yet, in spite of all this corroborative testimony, the picture confutes it, as the architecture of the building is of much later date than Van Eyck's time; the symbol of the Holy Spirit, the label, and the mitre are all of later character than those which existed at the time the picture is supposed to have been painted, and if by Van Eyck he must have been the earliest and greatest clairvoyant known. What Van Eyck's work really was and what was the style of the architecture he introduced into his paintings is seen by referring to Mr. Hope's beautiful specimen of this master (No. 521.) Here the Blessed Virgin stands in front of a Gothic niche of elaborate detail and exquisite drawing, clad in a deep red robe, whose folds fall in the more graceful manner his earlier works exhibit rather than the stiffer and more angular one he afterwards adopted, and which, in a caricatured form, became in later times so marked a feature of the German school. The Divine Infant clasps his mother lovingly round her neck, and the work is one of great sentiment and merit. One of even finer finish, however, exists in No. 533, now belonging to the Duke of Devonshire. This is erroneously styled the Virgin appearing to St. Bruno; it should, however, be St. Bernard, and not St. Bruno, as the latter was not decreed to be a "Beato" until a hundred and fifty years after Van Eyck's death and was not raised to the full rank and title of a saint until so late as 1623; consequently, devotional pictures of this individual were not likely to have an existence in Van Eyck's day. St. Bernard, that "sweet singer of the praises of Mary," kneels under an open and arcaded loggia on a height overlooking a town, whose variegated roofs, towers, and spires are seen through its archways, and a rolling landscape of wonderful aerial quality melts away into the horizon of the far distance. St. Barbara attends the founder of the Cistercian order, and presents him to the Blessed Virgin, who holds in her arms our Infant Lord. He stretches forth a tiny right hand to give his benediction to the saint, and holds in the left a crystal orb. The amount of finish and truthfulness of execution of this small picture, the size of which is only about 5in. by 4in., is something marvellous and incredible, rendering it one of the most wonderful productions of any school we have ever seen. By Hubert Van Eyck's scholar and John Van Eyck's fellow-pupil Gerard Van der Meire there is a fair Marriage of St. Katherine (512), and to Rogier Van der Weyden is ascribed a most interesting triptych from Mr. Heath's very valuable collection. The central panel is occupied by a deposition from the cross, and the two side wings—which, however, do not belong to this centre—contain illustrations of the finding of the cross by St. Helena, and its recovery and restoration by the Emperor Heraclius after it had been stolen by the Persian King Chroses, in 614, when he sacked Jerusalem. We are hardly inclined to accept these as the veritable work of Rogier, but should attribute them to some pupil of his school.

Another very interesting early picture here is by Hugo Van der Goes, also a pupil of Hubert Van Eyck, and (517) representing the installation of, and certain scenes from, the life of St. Augustine, a subject Van der Goes would thoroughly enter into, as his unrequited love for Jacob Weyten's fair daughter drove him to seek peace and consolation under the garb of an Austin Friar. The picture, though structurally not a triptych, is pictorially arranged as one, and is particularly noteworthy for the representation of a remarkably fine folding retable, which stands upon the high altar, in front of which the ceremony of the saint's installation is taking place. The thuribles, holy water vat, asperges, and other ecclesiastical instruments are all as well worthy of study as the picture itself.

Wohlgemuth, the tutor of Albert Durer, and the supposed designer of the woodcuts which adorn the celebrated *Nuremberg Chronicl*, is represented here by a picture of most elaborate workmanship, and of ultra pre-Raphaelite character—pre-Raphaelite, that is, in the modern acceptation of the term, for which we would rather substitute the title pre-Rubensite, for the tendency of this school has always been more to the hard material objectivism of the early German rather than the subjectivism and spiritualistic aims of the early Italian school. The subject here is a compound one, representing some of the events of our Lord's Passion, and probably formed a portion of an altar triptych, which included the whole. The principal event depicted upon this is that which gives the name, "Pilate Washing his Hands," to the picture. As an example of high finish and low art it is worthy of imitation in the present day, and the seared and scarred face of the villanous executioner is sufficiently horrible and true to life in its most repulsive form to commend itself to Mr. Madox Brown and his *confrères*. As a work of the painter it is very admirable, but as a work of painting it is very painful to contemplate, and, in its close imitativeness, provokes a quotation from old Cornelius Agrippa, who, in his "Vanity of Sciences," says, "Painting is a monstrous arte, but very studious for the counterfaiting of naturall things."

By Hans Hemling we have several works, one of the most important being a remarkably fine triptych from Mr. Heath's collection (515), the central subject representing the deposition from the cross, and the side wings containing effigies of St. James and St. Christopher.

Of Mabuse we have a magnificent example in Mr. Napier's "Adoration of the Magi," of which it is quite impossible to speak too highly—the marvellous richness of the accessories, the quaintness of the architectural background, and the sparkling effect of the

whole, rendering it one of the brightest gems of this gallery. It is arranged as a triptych, and on its wings are the Blessed Virgin as the Regina Cœli, and the Descent of the Holy Spirit at the Feast of Pentecost. In this artist's works we begin to trace the first symptoms of the introduction of the Italian spirit into German art, a change we shall see more prominently developed in Bernard Van Orley, to whom six works here are attributed, the best of which will be found under the number 537. This is a remarkably good example of the union of the two styles, and represents the Holy Family seated in a garden, having on one side a Gothic fountain of pleasing design, and on the other an Italian portico. The drawing is admirable, and the tone rich and luscious. In Mr. Cholmondeley's "Adoration of the Magi" we see this struggle of the two elements rather curiously developed, even to the costume, for St. Joseph carries in his hand a straw hat of ordinary Tuscan type, whilst Balthazar, the negro king, bears upon his sable head the bright red headgear of a German baron. To Quentin Matsys is ascribed one of the innumerable "misers" or "money changers," which we so frequently encounter under his name, but which we can so rarely with truth assign to his hand. This (558) we are inclined to believe to be the work of his son John, who rather traded upon his father's reputation.

Albert Durer has been very badly used by the namegivers here, and three pictures claim to be by him, none of which, however, show anything of his spirit. One, it is true, is a copy from his woodcut of the Death of the Virgin, and comes from the Liverpool Institution, a fact which is of itself almost a proof that it is not an original, as so few rightly-named paintings exist there. Another is a very brilliant and curious work of South German character, but does not exhibit any of the peculiarities of this great artist. The artist-friend of Martin Luther and Melancthon, Lucas Cranach, is here represented by one of his nude studies, which, from some cause or another, has acquired the title of the 'Artist's Wife." A smaller replica of this exists in the Berlin Gallery, and, if we recollect rightly, is so called there also. This bears upon the rim of the fountain in front of which the lady lies the crest of the painter (for he was a noble, and entitled to bear arms) and the date, 1534, and is a work of great merit. Far otherwise is a wretched French copy here, named after him, and which, if truly so, would go a long way to prove that the birth of Protestantism was the death of religious art. The subject is "The Woman Taken in Adultery," and the lady looks as though she rather liked it. The painting is poorly and flatly trowelled on, and is almost too impudent an imposture to deceive anybody, excepting, perhaps, its owner. Perhaps Cranach's highest fame is to be derived from the fact that he was the founder of the first printing press established at Wittemburg, whence was issued Martin Luther's bible, illustrated with woodcuts by the artist proprietor, and many other works, now of the greatest rarity and value. This brings us down to the day of Holbein and the connecting point between the art history of our own country and that of Germany, whence for a time we can carry on the study of the German school on our native soil. Hans Holbein is a name dear alike to the artist, the antiquary, and the historian, and the works bearing his name are numerous at Leeds, far more numerous than his paintings, for we have some copies, some works that are like Holbein's style, by contemporary artists of lesser note, and some that we are quite at a loss to divine why the name of the Augsburg painter was given to them at all.

One of the most puzzling curiosities here in the way of nomenclature is a portrait bearing the name of "Tho. Cromwel, Æt. Ano Dni 1515." Now inasmuch as Holbein was not in England until 1526, and at the age of fourteen Thomas Cromwell, the future Earl of Essex, was only emerging from the blacksmith's boy of Putney, it is not probable he went to Basle to have his likeness taken. There are two other portraits here of him, attributed to Holbein, but both, we think, are copies of an older and engraved picture, and do not give us the character of a man who could rise from being almost the lowest to the very highest subject of so changeable and imperious a monarch as King Henry VIII. Of his uxorious majesty we have one of the ordinary flat stock portraits usually attributed to Holbein, but which were undoubtedly made in large quantities "wholesale, retail, and for exportation;" and of his son, Edward VI., we have one which must have been painted after Holbein's death. This occurred, not, as has been popularly supposed, in the plague which devastated London in 1554, but some eleven years earlier, and when the young prince could only be about five years old. A more genuine specimen of his craft will be found in No. 530, which is the portrait of Archbishop Warham, a replica of that in the Louvre, but hardly equal to it. It is the semblance of a man worn and tired with life's battle, which must have been no ordinary strife in those days. The processional cross it grieved him to see carried before the Cardinal of York is on one side, and the mitre he was soon to resign to Cranmer on the other, and the effort to keep his own head on his shoulders in those days, when they seemed so loosely attached to the body, must have been a trying one to any man of eminence. Thomas Howard, Duke of Norfolk, is here twice represented, once by Holbein, and in a copy of this same portrait, by Sir Antonio More; but one of the finest portraits here is that known as "Sir Henry Guildford," from Windsor Castle. It is a good, well-painted picture, but has suffered somewhat cruel usage at the hands of the cleaner and restorer. The green background is cleverly broken up by a spray of fig leaves, not ivy or vine, as Mr. Wornum thinks, and which throws up the figure in an admirable manner. The Duke of Devonshire sends a charming little portrait specimen, like so many others, unknown. It is a red-bearded, angular face, of great character and most admirably modelled, being one of the finest examples of the master we have seen. Many of the other paintings ascribed to Holbein here are doubtful, though some of them are excellent pictures, but of some we wonder how any could so far and so blindly deceive themselves as to hang them on their walls with such an ascription.

Lucas de Heere, who visited England in the reigns of Mary and Elizabeth, is represented by one poor specimen, and his contemporary, Sir Antonio More, by but one genuine one and some few doubtful. His portrait of his Royal master—Mary's husband—is a very fine work, and the proud, scornful face of Philip is excellently painted. Sir Antonio resided in England all through the reign of Mary, having been sent by Philip to paint her portrait before he ventured over himself, and it is stated that not only his pencil, but his pen, was largely employed on Philip's behalf during the artist's residence here. On Mary's death he returned to Spain, and soon after lost, by a practical joke, his Royal master and nearly his own life. The king, as our article on Spanish painting will have shown, was a great patron of art and artists, and amongst his most favoured was Sir Antonio. One day the king visited the painter and familiarly placed his hand upon his shoulder, when the indiscreet fellow, with a want of tact truly artistic, dabbed a large bladder of carmine on it; the courtiers shrank with horror at the irreverence, the king was wrath, and More had to make a speedy exit from Spain to save his life. The supposed copy by him of Holbein's portrait of the Duke of Norfolk we have before referred to, and there is attributed to him a poor copy of one of Bronzino's innumerable Medici portraits, and we should be inclined to ascribe to him that much repainted head called "Geronimo Deodato" (No. 563) now claimed as a Holbein. To another Flemish portrait painter who found a home in England, Paul Vansomer, we owe the very excellent portrait of Francis Bacon, philosopher, statesman, and Lord Chancellor of England, and this brings us down to the day of that prince of painters, Peter Paul Rubens, a notice of whose works we must reserve for another article, for the works of the artists of the German, Dutch, and Flemish schools are very numerous at Leeds, and it is so rarely that we have an opportunity of examining so large and good a collection that we find it impossible to include even its chiefest merits in the space we can this week devote to it.

LINCOLN CATHEDRAL.*

GEOMETRICAL PERIOD.

THE introduction of tracery in the middle of the thirteenth century caused a rapid and complete change in the appearance of buildings. It arose from the practice of perforating in various ways, the spandrels of arches and the solid stonework lying between the heads of contiguous Lancet windows. Of this practice and of its progress through the Lancet period we have excellent examples in Lincoln Cathedral. In the plain circles, trefoils, and quatrefoils, with which the solid stonework above the snb-arches of the blind-storey of the choir and east transept of Bishop Hugh is perforated, we see an early and a somewhat clumsy effort to relieve this blank space. In the nave three foiled openings more completely occupy it; and in the noble wheel window of the north transept so entirely is the large plate of stonework which fills the circle pierced that but small portions of solid stone remain between the circular voids. To call this a traceried window, however, would be a mistake. The principle of tracery, which consists in the conversion of the whole of these intervening portions of stonework into moulded bars, is wanting. This is the invention, then, which, applied in circular forms to the windows of the succeeding period, forms its chief characteristic.

1. Of the noble series of monumental works which were constructed in England during this Geometrical period one of the earliest and certainly one of the finest is the presbytery of Lincoln Cathedral. Designed, as we know it to have been, about the year 1256, at the exact moment when Gothic architecture, in its chief forms, its sculpture, its carved and moulded work had reached its highest development, it exhibits in every part a refinement and elegance, as well as a delicacy of finish in its minutest details, to which it would be difficult to find a parallel in the whole range of Gothic art. To attempt to describe to you its varied beauties in the short space of time at our disposal would be a vain effort. I can only hope to point out a few of them as we pass through the building this afternoon. I cannot, however, pass over without notice its chief and most characteristic feature, its glorious east window of eight lights, confessedly the finest of its kind in the kingdom; which, occupying, as it does, the entire east end on the inside, and worked out, as it is, with a wealth of deeply-moulded detail of surpassing excellence, may be looked upon as the crowning work of the singularly beautiful building, of which it forms the termination and chief ornament.

This building, commenced, as it is reasonable to suppose, immediately after the granting of the royal permission to remove the city wall in order to permit its construction in 1256, was so far finished in 1282 that Bishop Hugh's shrine was transferred into that year.

Among the remaining works of the Geometrical period may be noticed—

2. The stone screens of the choir on the east, north, and south sides. They were probably all commenced soon after the completion of the presbytery. One of them, on the north side, has, on its aisle front, an arcade of circular foliated tracery so exactly similar to that of the aisle arcade of the nave of York Minster, and is finished with straight canopies carrying mouldings, crockets, and finials, so identically the same, that it is

* Lecture delivered to the Members of the Lincolnshire Diocesan Architectural Society at their Annual Meeting at Lincoln, on Wednesday, June 17, 1868. By Edmund Sharpe, Esq., F.R.I.B.A. Continued from p. 483.

scarcely possible to suppose that they were not designed by the same hand.

3. An Easter sepulchre on the north side of the choir, with figures and carved work of great excellence, belongs also to this later Geometrical work.

4. It was not until the middle of the Geometrical period that the stone carvers of the middle ages began first to imitate in their works the foliage of nature. The period is thus divisible almost equally into two portions, early and late—during the earlier of which the carved work was of *conventional* design, and during the later in imitation of *natural* forms. In the Presbytery the capitals not only of the piers but of all the host of minor shafts, carry foliage of the most elegant conventional type, consisting of curled leaves of the most varied outline, but all designed in the same spirit.

In the passage leading from the north eastern transept to the cloisters, and in the cloisters themselves, we have an opportunity of contrasting this new fashion of carving, introduced about the years 1280—1290, with the old: the capitals of all the shafts of the tracery of these two later geometrical works having natural foliage only, chiefly in imitation of the oak and the vine leaf. So much as remains of this cloister is in other respects an interesting example of the works of the second half of the Geometrical period.

5. Whether the central tower, of which the two lower storeys remain, was ever carried higher, we have no record, and no present means of knowing. What is certain is, that its noble upper storey, belonging to the latter part of the Geometrical Period, must have been commenced about the year 1306. It is justly reckoned one of the finest central towers in the kingdom, and groups as grandly with the two smaller western towers as the central spire of Lichfield Cathedral does with the two subordinate western spires of that building.

CURVILINEAR PERIOD.

1. Whether or not all may be disposed to agree that the progress of art, from the point at which we have now arrived, was in a downward direction, and that the decay into which church architecture fell at the close of the Rectilinear period, dates in its earliest beginnings from the time when natural foliage was introduced into the ornamentation of buildings, and flowing tracery into their windows, it cannot be denied that, in one respect, the builders of the two latest periods surpassed their predecessors. The graceful finish of the upper walls and gables of by far the greater part of our cathedral and parish churches, of whatever date, is due to the panelled and pierced parapets and crocketed pinnacles of the Curvilinear and Rectilinear periods. Of this we have notable examples at Lincoln, the earliest of which occurs in the panelled parapet of the west front, which crowns so appropriately the earlier work below. To the same date belongs the flowing pierced parapet of the south clerestory of the nave, with its Curvilinear pinnacles marking the limits of each compartment. Following this parapet westwards we arrive at the west wall of the south transept, along which this open parapet of flowing tracery is still continued.

2. The chief work of this period, however, was the remodelling of the south front of the south transept. This work consists of a large circular window corresponding with the rose window of the north transept, and filled with flowing tracery of Flamboyant character, of a large five-light window above, and of a pierced parapet of flowing tracery to the gable.

3. It is not improbable that this work is due to the Burghersh family, one of whose members was Bishop of Lincoln from 1320 to 1340, during the time, in fact, that it must have been executed. This supposition is confirmed by the circumstance that a chantry belonging to this family was founded at the east end of the north aisle of the presbytery, one side of which was formed of the tombs of Lord Burghersh, the founder, who died in 1356, and of his brother, the bishop, who died in 1340, which are both very interesting monuments.

4. The last works of this period were the two canopied tombs at the east end of the presbytery, under the last pier-arch on the south side. They are, although late, of very elegant workmanship, and were probably erected during the lifetime of Lord Cantilupe, by whom the adjoining chantry is said to have been founded, but who did not die until 1372.

One of the most elaborate and admirable screens of any that exist, designed in this style, is to be seen in this cathedral, under the east arch of the crossing, and serves at present as the organ screen. It is stated by Wild to have been constructed in the year 1775; but it is scarcely credible that so excellent a work is due to a period when Gothic architecture was so little understood and appreciated. It is probable that it is a very careful and accurate restoration of an existing work of undoubtedly great merit, and that the greater part of what we see belongs really to the earlier part of the Curvilinear period. It deserves attentive study.

RECTILINEAR PERIOD.

1. Strongly resembling the Cantilupe tomb is the arcading of the interior of the ground-storey of the two western towers, with its elaborate vaulting; and to the same early date probably belongs the interior of the west doorway.

2. The upper part of the west towers was, no doubt, the next work executed. They are plain but well proportioned.

3. The insertion of the west windows of the nave and north and south aisles followed, and the construction of the canopied work above the west doorway, with its row of kingly statues, is of the same date.

4. The west porch of the south transept received in this period its richly panelled parapet, and the airy lightness of the sky-outline of the central tower is due to its pierced Rectilinear parapet, constructed probably about the same time.

5. The three last works remaining to be described belong all to the latter part of this period. They are the chantry chapel of Bishop Fleming, who died A.D. 1432; of Bishop Russell, who died A.D. 1480; and of Bishop Longland, who died A.D. 1521. The two last-named are excellent examples of this kind of sepulchral oratories, which were often erected by the prelates themselves during their lifetime.

In the transepts are several screens of excellent Rectilinear design, and the stall work of the choir, executed in the early part of the period, is amongst the best in the kingdom.

THE SOCIETY OF ARTS AND TECHNICAL EDUCATION.

IN February last a meeting was held at the Society of Arts, at which a number of speeches were delivered on the unsatisfactory condition of education in general and technical education in particular, in this country. The meeting ended in the formation of a sub-committee, which numbered amongst its members some of our ablest public men. This sub-committee was appointed to consider the question in its various bearings and to report thereon. The report, which has just appeared, sums up its inquiries and advice in the following resolutions:—

For the purposes of discussion, technical education should be deemed to exclude the manual instruction in arts and manufactures which is given in the workshop

That the term "technical education" is understood by the sub-committee to mean general instruction in those sciences the principles of which are applicable to various employments of life.

The technical instruction, as defined above, should not, as a rule, be given in separate professional institutions, but in institutions established for general education.

That, with a view to the development of a system of scientific education, it is desirable that schools be established having for their main object the teaching of science as a mental discipline. These science schools should prepare some youths for the higher courses of a college, and other less ambitious pupils for their professional pupilage.

That the subject of secondary instruction having been reported upon ably and deliberately by the Schools Inquiry Commission, the committee do not feel it necessary to enter into the details of this subject, while they desire emphatically to express their opinion of the necessity for the introduction of scientific teaching in all secondary schools.

That it is desirable that the higher scientific instruction should be tested by public examination, and that the proficiency of persons who pass these examinations should be certified by diploma.

That the preparation for the businesses considered by the committee is not sufficient until due scientific instruction has been followed by practical pupilage in efficient works.

The committee recommend employers of labour and others in the habit of taking pupils, apprentices, and clerks, to give the preference, as far as possible, to those adducing evidence of the possession of adequate instruction in the sciences applicable respectively to their professions or occupations.

Ample reasons are given for these recommendations.

The sub-committee are of opinion that Government should encourage systematic scientific instruction in the following way:—

1. By adopting the recommendations of the Schools Inquiry Commission, for the introduction of the teaching of natural science into all secondary schools, and for establishing new science schools of the first grade, which schools should be on all points on a footing of equality with the endowed classical schools.

2. By co-operating with universities and colleges in holding examinations which are or may be established for the purpose of conferring certificates or diplomas in connection with systematic studies, intended to educate civil engineers, mechanical engineers, officers of the mercantile marine, metallurgists, miners, naval architects, and marine engineers, architects, merchants, chemists, and agriculturists.

3. By giving some official value to those certificates or diplomas, such as allowing certain diplomas to represent a given number of marks in competitive examinations.

4. By putting at the disposal of the leading colleges which give methodical courses of scientific instruction, and diplomas of recognised value, a limited number of nominations annually.

5. By assisting old and new endowments where local subscriptions or donations prove the value set on the instruction proposed or given.

6. By instituting night classes for workmen in connection with all new scientific endowments, with access to a library.

7. By providing free libraries suitable for the use of students in night classes generally.

8. By providing suitable meeting-rooms for night classes organised among workmen, for the purpose of obtaining scientific instruction.

9. By according liberal prizes to workmen for excellence in mechanical drawing.

10. By taking steps to extend and improve primary education.

The sub-committee recommend that colleges should encourage systematic scientific instruction by the following measures:—

1. By instituting methodical courses of scientific teaching, adapted to students intending to enter a profession or business among those which have been enumerated above.

2. By the establishment of diplomas, corresponding to the several courses of study in conjunction with Government, and with the leading institutes belonging to each profession.

3. By the establishment of fellowships and scholarships in connection with those diplomas.

It is desirable that the leading civil and mechanical engineers, architects, merchants, shipowners, chemists, manufacturers, and agriculturists should encourage systematic scientific instruction by the following measures:—

1. By the creation of scholarships and fellowships in connection with those schools and colleges where methodical courses of instruction are given.

2. By co-operating in the examinations for diplomas.

3 By giving a practical value to those diplomas, such as could be evinced by a reduction of premiums to intending pupils holding such diplomas, and by attaching weight to the possession of a diploma when choosing among candidates for employment.

4. By granting distinct privileges, in connection with the professional institutes, to all holders of recognised diplomas.

At the meeting, on Tuesday, of the Technical Education Committee of the Society of Arts, the general satisfaction which was felt with the report of the sub-committee was manifest from the exceedingly thin attendance. A discussion ensued upon a suggestion of Mr. Ayrton, M.P., that science ought to be taught to children of eight years and upwards in national schools. Professor Williamson pronounced this impracticable. Dr. Storrar admitted that at so early an age only the facts of science could be conveyed, arguing strongly that the principles of science were not so easily grasped; Dr. Yeats, of the Middle and Upper Schools, Peckham, confirmed from his experience the drift of Dr. Storrar's argument; while Mr. Ellis A. Davidson and Mr. Antonio Brady spoke

of special instances showing how deeply rooted the love of scientific instruction might become in minds early familiarised with scientific phenomena. Ultimately on the motion of Mr. Ayrton, seconded by Mr. Brady, the report was adopted and ordered to be printed and circulated; and the sub-committee were requested to continue their labours until the reassembling of Parliament.

DISPUTE BETWEEN AN ARCHITECT AND A VESTRY.

AT the meeting of the Shoreditch Vestry, on Tuesday week, reports of the Vestry Hall Committee were considered. It appeared from one report that Mr. C. A. Long, the architect of the new townhall in Old-street Road, had sent in his bill of costs, amounting to £1,329 11s. 6d. He had received on account £800, and requested payment of the balance of £529 11s. 6d. The committee recommended that certain items in the account should not be allowed, but that the sum of £358 14s. 8d. be offered to Mr. Long in full of all his demands upon the Vestry. Mr. Long declined to submit to the deductions made in his bill, stating that it was framed on the most reasonable terms, and in strict accordance with the rules of the R.I.B.A. He was willing to receive the sum offered on account of his demands, and to refer the disputed charges to the arbitrament of some eminent architect, to be mutually agreed upon, or to deduct £50 from his bill, and accept £479 11s 6d. as a full settlement of his claims. The committee recommended that neither of these propositions be agreed to. After a long discussion, in which the architect was referred to in no very complimentary terms, one of the vestrymen moved that £400 be paid to Mr. Long, in full of his claims upon the vestry. An amendment was moved that £358 should be the sum paid, as recommended in the report. The amendment was carried by twenty to twelve, in spite of the warning of one of the vestrymen that they would go into a court of law with a very bad grace after refusing the architect's offer to submit the matter to arbitration.

REREDOS SKETCHES.

THE principal of the three reredos designs illustrated in this week's number is intended to be executed in stone, or alabaster and marble. The intention of the group in the chief panel is a symbolic rendering of the elements used in the sacrament of the Holy Communion; in the centre is a group of conventional foliage or scroll work, from which on the one side spring out ears of wheat, and on the other the fruit and leaves of the vine, which are being gathered by the angels, while over them the Holy Spirit is typified by the emblem of the dove. The other two designs are for reredos crosses, which may be executed in sculpture, inlay, or painting, or by a combination of all three. J. M. S.

MATERIALS FOR BLASTING.

HITHERTO the employment of nitro-glycerine for blasting and similar purposes has been attended with considerable danger. A recent invention, by Mr. Carl Dittman, civil engineer, of Berlin, has for its object not only to render the employment of nitro-glycerine safe, but to enable it to be transported and stored free from its present attendant liability to explosion. Mr. Dittman mixes the nitro-glycerine with a porous, combustible substance, such as finely-divided wood charcoal, which (by preference) has been previously saturated with a solution of saltpetre or nitrate of soda, or mixtures of the same, and also with a solution of carbonate of soda, and subsequently dried so as to expel the water employed for effecting such solution; or the nitro-glycerine may be mixed with nitro-cellulose—*i.e.*, with finely-divided wood or other solid liquorous matter which has been treated with nitric and sulphuric acid in a manner similar to that employed for the production of gun-cotton; or the nitro-glycerine may be mixed with sawdust or finely divided solid liquorous matters, previously impregnated with a solution of nitrate of potash or nitrate of soda, or mixture of the same, and with an alkali such as carbonate of soda, and subsequently dried so as to expel the water employed for effecting the solution of the salts; or, instead of employing the substances prepared as mentioned in combination with nitro-glycerine individually, mixtures of the same may be employed, and where such mixture of any two or more of the before-mentioned substances are employed with nitro-glycerine, the proportions of the same may be varied according to the desired requirement of the blasting material.

DUSTBINS.

DR. WHITMORE, the Medical Officer of Health of Marylebone, in his last monthly report, says:—"On some previous occasions I have found it necessary to advert to the intolerable nuisance which arises from dustbins in the hot months of summer, an evil which, I regret to say, lies more at the doors of the rich than the poor, and which will probably continue to exist until the owners of some few of our aristocratic mansions are summoned before the magistrate and fined for causing a nuisance injurious to the health of their neighbours. A few days since my attention was called to an abomination of this kind at a large house in my own immediate neighbourhood. The occupant of the adjoining house, by whom the complaint was made, assured me that whenever he went in or out of his own dwelling, his olfactory nerves were assailed by a most disgusting effluvia, which made him feel quite sick for a long time afterwards. The inspector, on visiting the premises, found the nuisance to proceed from the dustbin, which contained a large quantity of both animal and vegetable refuse in a decomposing state, and which, to use his own words, 'stunk most horribly.' Now this is but a slightly exaggerated description of the condition of scores of dustbins in some of our most highly rented houses, and it is really a disgrace to the owners of them that so disgusting a nuisance, which is not only injurious to the health of the servants living in the basement, but also very annoying to the next door neighbours and passers by, should be permitted to exist. Under no circumstances ought the servants to be allowed to throw either animal or vegetable refuse into the dustbin; the latter, as I have often before said, can easily be burned, unless the family be unusually large. It is simply necessary to place it, when the process of cooking for the day is over, at the back of the kitchen fire, where, in an hour or two, it becomes perfectly dried, and when it can be burned up in a few seconds without producing the slightest smell. In many families that I am acquainted with this is habitually done."

TOWN CHURCHES.

AT the last quarterly meeting of the Exeter Diocesan Architectural Society a paper was read on "Town Churches," by Mr. P. B. Hayward. The author called attention to the advantages which continental churches possess over those of this country, by being constructed so as to offer a vast unbroken space to the body of worshippers, enabling all to see and take part in the services, differing from our English churches in the absence of aisles. One form of this description of building was the polygonal or circular nave, such as in the Temple Church of London, and the churches of Cambridge and Northampton. Such a building might be roofed with a dome, like St. Paul's, or with a lantern like Ely. Even if aisles were introduced they should be used simply as passages, as in the new churches of St. Michael in this city. The cost of such churches would be great, but he argued that it was better to build one noble church than two or three inferior ones. He next called attention to the desirability, both in respect of beauty and utility, of erecting our churches higher than the surrounding buildings. There were two kinds of roofs which might be used with advantage in large rectangular churches—an open timber roof, but this was objectionable, and he preferred an iron roof. There was no limit to the capacity of that material, and he saw no reason why it should not be used in our churches. Another plan he suggested was a species of barrel roof—for the idea of which he was indebted to his father—of which he showed a sketch. Referring to the deleterious effects of town smoke on architecture, he noticed the suggestion which had been put forth for encasing the fronts of our houses and public buildings with glazed tiles. There were no doubt difficulties in the way of the adoption of this idea, but he saw no reason why terra cotta, which had been shown to be impervious to a London atmosphere, should not be more largely used, both in secular and ecclesiastical architecture. At Barking there was a new church where terra cotta entirely took the place of stone in the window tracery, columns, arches, &c. With regard to the seats in churches, he strongly advocated the use of chairs in the place of pews or benches. Not only was their cost less (about one-third), but they could be well adapted to the size of the congregation. In conclusion he strongly condemned the modern practice of elaborately and richly ornamenting the outside of our churches, and leaving the interior pinched and poverty stricken, and pointed out that it sometimes happens that a noble interior involves an unsightly and unpicturesque exterior. Let our churches, he said, depend chiefly on symmetry and dignity of outline for their external effect—and let us lavish on the interior all the wealth of art and imagination with which God has endowed us.

In the course of the conversation which followed it was stated that at Bolton-le-Moors, in Lancashire, terra cotta was used, with great effect, very largely in the construction of the church; the seats, the organ case, &c., being composed of that material. It was also used in the construction of the parsonage house. It was also mentioned that if chairs were adopted, the seating of a church would cost about 3s. 6d. per head of the congregation, but if pews the cost would be 10s. 6d.

BUCKS ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY.

THE annual meeting and excursion of this society took place on Monday week, the scenes of operation being Windsor Castle and Eton College. The party assembled in the Castle-yard, Windsor, at eleven o'clock, where they were met by Mr. Woodward, her Majesty's librarian, who accompanied them within the Castle, and gave a short address on its history, explaining the periods at which the principal portions of the building were supposed to have been erected, its original construction, and the changes that from time to time had taken place. The party subsequently (under the guidance of Mr. Parker, of Oxford) inspected the exterior of the Castle on the south side, and afterwards proceeded to Wolsey's Chapel, St. George's Chapel, and cloisters, the choir, &c. The descriptive comments by Mr. Parker on each were interesting. The visit to Eton College formed the second portion of the day's excursion. After inspecting the College buildings and chapel, especially the stained glass windows of the latter, which were commented upon by Mr. Parker, the company proceeded to the College Hall, where the general business of the society was transacted. Archdeacon Bickersteth presided. From the annual report, read by Mr. Lowndes, the secretary, it appeared that the society has now been in existence for twenty-one years. During these years much useful work has been accomplished in the accumulation of valuable information, which has been published in the "Records of Buckinghamshire;" in the establishment of a county library and museum, and the collection of antiquities, drawings, manuscripts, &c., illustrative of the history of the county. The roll of members in the first year only contained 55 names, but at the end of last year it contained 247. During the past year 14 new members have been added to the list, and 11 have been removed by death and resignation. Among those removed by death is Colonel Hanmer, one of the oldest members, and a vice-president of the society. The report was adopted, the officers for the ensuing year were re-elected, the Rev. Dr. Goodford, Provost of Eton, was elected vice-president, and fourteen new members were added to the society. The Provost of Eton then read a paper on "The Antiquities of Eton," after which the Rev. Wharton B. Marriott read a paper on "The Vestments of the Church." At the close of the proceedings the company were entertained by the Provost of Eton.

The Rector of St. John's, Southwark, is promoting a scheme to throw open the present churchyards in the parish for the recreation and use of the parishioners. The scheme seems an admirable one; these churchyards might very easily be divested of their gloomiest associations and be made pleasant promenades. The Rector appears to have something of this sort in view, as he talks of making the churchyard a place where "poor old people may smoke their pipes."

THE PALMERSTON MEMORIALS.

THE two memorials erected at Romsey to Lord Palmerston were inaugurated on Tuesday. The stained window in the Abbey Church is very large, the centre light being 39ft. by 5ft. 7in., and the two side lights, 36ft. 6in. by 4ft. 2in. each. The window has been designed by Messrs. Clayton and Bell, to exemplify the idea of Government descending from heaven to earth. In the upper portion of the three windows is a representation of the highest idea of rule—the Lord Jesus Christ sitting on the throne of glory, surrounded by adoring saints and angels. Below are three subjects from the New Testament, showing acts of power and teaching; namely, our Lord feeding the Five Thousand; the Sermon on the Mount, and the Tribute Money. Below these, again, are three subjects from the Old Testament, illustrative of power and government; namely, Joseph Distributing Corn in Egypt; the Judgment of Solomon, and Daniel as Ruler. In the lower tier are figures showing, allegorically, three modes of action in which an earthly ruler may beneficially exercise his power:—1. In preserving peace and plenty; 2. In making war in defence of his country and of a right cause; 3. In breaking fetters and liberating captives; and at the bottom are the heraldic bearings of Lord Palmerston, and the following inscription:—"In memory of Viscount Palmerston: obit 1865." Beneath each of the Scripture subjects is a descriptive Latin text. In an arcading dividing the subjects horizontally are demi-figures of patriarchs, prophets, kings, apostles, and saints. The statue on the market place, which is by Mr. Noble, is of bronze, and it represents the deceased statesman in his usual attitude whilst addressing the House of Commons. The statue, including the bronze plinth, is 8ft. 10in., and the pedestal 9ft. 6in. in height. The latter is formed of Aberdeen granite, and is about 6ft. 3in. square at the base, with a polished shaft, on the front of which, in letters of gold, is inscribed "Palmerston," and at the back "Born, 1784; died, 1865."

POTTERY AND PORCELAIN.

ON the 9th inst. Mr. Chaffers, superintendent of the Museum of Ornamental Art in the Leeds Exhibition, resumed his lecture on "Pottery and Porcelain," the first part of which occupied the attention of a select audience in the Philosophical Hall, Leeds, on Tuesday week. In continuation of the thread of his Tuesday's lecture, Mr. Chaffers gave a short notice of the family and history of Wedgwood, and of his inventions. He summed up this branch of his subject by saying that Wedgwood's ordinary productions combined utility with neatness and some degree of elegance, and in his ornamental works he emulated the ancient potters of Greece, in doing which he was ably assisted by his partner. The next subject to which the lecturer addressed himself was Oriental or Chinese porcelain. The manufacture of porcelain was discovered by the Chinese 1,600 years before the western nations of the globe became acquainted with the secret as to the composition of porcelain. Kin-ti-Chin was the principal centre of this Oriental manufacture, but the rebel Taepings had totally destroyed it, and given a fatal blow to this interesting and valuable manufacture there. The porcelain tower in another locality had also been destroyed by the rebels. Mr. Chaffers next described the materials of which Chinese vases are composed; and next in order he considered the character of the decorations, and said as much as ten thousand francs had been given at a public sale for an ancient Oriental specimen. The Portuguese trade with Japan, which was interrupted in 1641 because of the attempts made to Christianise the natives, was succeeded by the Dutch getting a monopoly of the exportation of porcelain from Japan, and they had retained that privilege for more than two centuries. There was but scanty information as to the making of porcelain in Japan, but in its fabrication the porcelain of Japan was very much like that of China, though the colours were more brilliant and fine, and the birds and flowers more natural. European porcelain was next brought under notice, and those specimens which have a world-wide reputation were especially made mention of. The first attempt to imitate Chinese porcelain was made in 1580, but the ware was not so hard as that of China, and not more than thirty specimens of those products now remained. In 1706 the first operations for the manufacture of hard paste took place at the celebrated manufactory at Dresden or Meissen, and it was from 1751 to 1756 that the best productions emanated from it. The Berlin and other manufactories having been hastily referred to, the lecturer mentioned the establishment of a manufactory at St. Cloud, in France, in 1695, which might be considered the parent of all the porcelain manufactures in France. The manufacture of porcelain in England began much earlier than was generally supposed, an Englishman having, in 1671, taken out a patent "for the manufacture of transparent earthenware." The Stratford-le-Bow, the Chelsea, and the Derby manufactories, and the peculiarities of their glaze, and their other perfections were vividly described. Worcester was still a flourishing seat of the art of making porcelain which neither grew brown nor cracked, as other products of that class often did. Donaldson's classical vases, and a dessert service painted by a lady at the latter end of last century, were prominently named, and the most celebrated painters in porcelain of more modern times were honourably recalled to the minds of the audience. The lecture was brought to a close with the usual formalities.

THE DWELLINGS OF THE IRISH PEASANTRY.

THE Irish Poor Law Board, in a report just presented to Parliament, describes the present condition of the great bulk of the agricultural population of Ireland, and the rapid progress that population has made within the last eighteen years in the matters of food, clothing, and dwellings. On the latter head it is said that more than 400,000 of the worst class of cabins have been demolished since 1841. It is, however, a fact that the class next above the lowest is still the dwelling most in use. This class, although greatly inferior in lighting, cleanliness, and comfort to the English cottage, has one sanitary condition which atones for much of its apparent discomfort. The one room, serving for both day-room and dormitory, occupies the whole length, breadth, and height of the building, and is ventilated all day by a draught from the open door to a blazing turf fire under an ample chimney. Even at night, when the door is closed, there are crevices which, with the aid of the constantly burning fire, effectually and continuously ventilate the apartment. Compared with the ceiled bed-rooms of the poor denizens of large towns, the thatched cabin of the Irish peasant is comparatively free from the most active and prolific source of fever, the presence of vitiated air. The rate of mortality by fever in unions comprising large towns is more than twice that of unions with a rural population. The best evidence of the improved condition of the Irish peasantry and their dwellings is found in the fact that the country has been comparatively free from any epidemic during the past eighteen years.

SCHOOLS OF ART.

THE distribution of the prizes to the successful students in the West London School of Art took place on Saturday last in the lecture-room of the Geological Museum, Jermyn-street, under the presidency of Mr. A. J. Beresford Hope, M.P. Mr. Hope, before distributing the prizes, directed attention to the fact that though the West London was the youngest, it was, at the same time, one of the most prosperous of such institutions, for next to South Kensington it had the largest number of pupils, giving instruction to not less than 492 students. Among the students who attended the school during the year he was glad to find that there were 67 draughtsmen and designers, 45 decorators, &c.; 41 wood, stone, and ivory carvers; 9 modellers; 27 glass painters; 11 papier machè workers; 18 goldsmiths, &c.; 23 engravers and diesinkers; 16 metal workers; 21 cabinetmakers; 31 upholsterers; 9 musical instrument makers; 43 carpenters and joiners; 14 machinists; 4 masons; 18 salesmen and clerks; and 23 teachers. Mr. Ruskin also addressed the students, complimenting them with discrimination on the progress which they had made in the study of art. He had watched the progress of the school, and regretted that he had not been able to devote more time and attention to giving advice and assistance when required of him. He advised them to study carefully what he called "the three-legged stool of art," viz., form, shade, and colour. If they worked and studied earnestly they must live on bread and water during their early days, but they would in the end feed upon ambrosia. Mr. Digby Wyatt briefly referred to the satisfactory progress of the students of the school, a circumstance not less gratifying to the students themselves than to the masters, who had devoted so much time and attention to its management and control. It was a gratifying feature that the young people who had taken the prizes were all more or less connected with the technical arts of the country. It was this connection of art with technical industry that was the great want of the present day. A few years ago England was sadly behind some of the countries of Europe. Mr. Peter Graham dwelt on the importance in a commercial point of view of greater attention to the studies connected with art and industry. England had powerful competitors in every part of the world, and the only way to make that competition successful was to unite as completely as possible the study of art with technical industry. He proposed a vote of thanks to Mr. Hope for his attendance. This vote, carried unanimously, as also a vote to Mr. Macdonald Clarke, the master, and the other officers of the school, brought the proceedings to a close.

ARCHÆOLOGY.

A GENERAL meeting of the members of the Devonshire Archæological Society was held on Thursday week, at Exeter, the president, E. Smirke, Esq., in the chair. The Ven. Archdeacon Freeman was elected a member. The following objects of interest were exhibited:—An emerald signet ring, bearing an Eastern inscription, once belonging to the King of Delhi, but now the property of Mrs. Palmer, and an antique cornelian ring, belonging to Mrs. Thompson—both shown by Lieut.-Col. Harding, F.G.S; a Samian patera, found in Exeter, and a portion of a smaller one, shown by W. R. Crabbe, Esq., F.S.A.; and two Palstaves found at Chagford, by G. W. Ormerod, Esq. A paper on the "Ancient Stone Bridges of Dartmoor" was read by Lieut.-Col. Hardinge, and another, on "Archæology," by W. R. Crabbe, F.S.A.

WATER SUPPLY AND SANITARY MATTERS.

A SYSTEM of sewerage has just been undertaken at Wolverhampton, at an estimated cost of £40,000. The sewage is to be utilised, and land has been bought for the necessary works of filtration and irrigation.

The attention of the Chief Commissioner of Woods and Forests has been drawn to the present offensive state of the pond near the northern end of the Broad-walk, Regent's Park. The Sanitary Committee of the St. Pancras Vestry advise that it be thoroughly cleansed and supplied with fresh water.

Building Intelligence.

CHURCHES AND CHAPELS.

A new font has just been placed in Christ Church, Albany-street, or rather the old font of white marble has been cased with other various marbles. The church some time ago was thoroughly redecorated, and there was only wanting a font of a superior nature to complete it. This has now been fixed, and shown for the first time last Sunday week, in time for a festival held there on Monday week, the thirty-first anniversary of the dedication of the church. Mr. Butterfield was the architect for the restoration. The design of the chancel is very tasteful. The reredos is composed of various marbles and alabaster. Derbyshire fossil, white marble, Languedoc red marble, Irish green marble, dove, and alabaster, have been used for the chancel work. The steps to the altar are marble, risers of red and dove marble to white treads. The floors in the nave and aisles are of encaustic tiles, self-coloured mixed with Portland stone. Open wainscot oak seats have taken the place of close pews.

The new Catholic Church at Burton Park, Sussex, is rapidly approaching completion, and will be opened some time this month. The details are of the most elaborate character. Mr. Gilbert R. Blount is the architect, Mr. Edward Jones the clerk of works, and Mr. J. Ellis, of Chichester, the builder.

The lately restored parish church of Elmesthorpe, Leicestershire, was reopened on the 14th inst. The building originally consisted of nave and chancel, and was built by the Earl of Leicester in the reign of Edward II., and part of the army of Richard III. slept within its walls on the night before the battle of Bosworth field.

St. Philip's Church, Kelsall, was consecrated on the 9th inst. by the Bishop of Chester. The style of the building is early Gothic of the thirteenth century, and it comprises nave, chancel, sacristy, and organ chamber. It is rather small, only affording sitting room for 180 adults and 80 children. Mr. Thomas Bower, jun., of Nantwich, was the architect.

On Wednesday week the foundation stone of a new Wesleyan Chapel was laid at South Shields. The chapel will be 68ft. by 40ft. in breadth, the vestry and porch will be 24ft. by 10ft., and the schoolroom 50ft. by 24ft. Accommodation will be provided for 400 sittings in the chapel, and 300 children in the schools. Mr. T. A. Page is architect, and Mr. Joseph Robson contractor. The cost will not much exceed £1,000.

On Thursday week the Bishop of Chester consecrated the new church of St. Paul, Bootle, Lancashire. The style of architecture is the Geometric Pointed, of a simple character, the west front having a central recessed porch and a large window over. On the north of the doorway there is a bell turret, 110ft. high. The front and side porches are built in Yorkshire shoddy stone and Stourton stone dressings, the remainder of picked bricks and stone dressings. There is accommodation for 850 persons in the shape of open benches on the ground floor, two galleries, and a small organ gallery at the west end. Messrs. Culshaw and Summers, of Rumford-court, are the architects, and Mr. George Rome the builder.

On Monday afternoon the foundation stone of a new Wesleyan Chapel was laid at Burscough, near Liverpool. The plan of the building is cruciform. The building will be in the Early Pointed style. The architect is Mr. Thomas Bridge, jun.

A new reading-desk, lectern, and pulpit have been placed during the past week in St. Nicholas Church, Tooting-Graveney, S.W. The reading-desk and lectern are of wainscot oak, with shafts of polished ebony, the capitals of the former being moulded, and those of the latter carved. The pulpit is of Caen stone, supported on eight columns of Irish green and red Devonshire marble alternately. The centre shaft, of yellow Mansfield stone, is octagonal in plan. Five sides of the pulpit are incised with the following figures under canopies:—1. Our Lord. 2. St. Peter. 3. St Paul. 4. Moses. 5. Elijah. The whole is surmounted with a foliated cornice. The lectern is a memorial offering. The rector has replaced those pews which are his property with open seats of a simple and effective design. The architect is Mr. E. Swinfen Harris, and the work has been executed by Messrs. Bell, Redfern, and Almond.

A letter from Jernsalem states that the grand cupola of the church of St. Sepulchre (which had fallen in) is now entirely covered with lead and surmounted with an elegant cross of gilt bronze. In the interior the mural paintings are being rapidly restored, and about the end of October the whole of the repairs will be finished and the scaffolding removed from the edifice.

The foundation stone of a new Congregational Church at Stoney Stanton, Leicestershire, was laid on Tuesday, the 30th ult.

On the 1st inst. the foundation stone of a new Baptist Chapel was laid on the site of the old chapel, Greek-street, Stockport. The estimated cost is £3,000.

On Wednesday week the foundation stone of the church of St. David, Westbourne-road, Arundel-square, was laid by the Earl of Shaftesbury. The cost, including site, will be upwards of £4,000, and seats will be provided for 1,000 persons.

On the 10th inst. the corner stone of the nave of Prior's Hardwick Church, which is being restored, was laid. The architects are Messrs. Slater and Carpenter, and the builder is Mr. Watson, of Napton.

The church of St. Mary, Sheet, Petersfield, Hants, is about to be completed by the addition of the remaining portion of the tower and a spire, in accordance with the original design, the Bishop of the diocese bearing the expense.

On Monday week the Bishop of Oxford consecrated the new church at Bledlow Ridge, Bucks, the foundation stone of which was laid in August last. The building is small and neat, and consists of nave and chancel, with a south porch, and bell turret at the western end. It is simple in detail, and is built of flint, with stone windows and coping.

On Tuesday last the Bishop of Hexham laid the foundation of a new (Roman) Catholic Church at the Brooms, Leadgate, near Newcastle. The style of architecture adopted in the new structure will be Gothic. Mr. E. Welby Pugin, of London and Ramsgate, is the architect; and Mr. Jasper Thornton, of Durham, the contractor for the masonry, plastering, and slating.

On Tuesday the foundation stone of a new Wesleyan Chapel was laid at Bill Quay, Newcastle. The style of the building is Gothic. It will seat 450 persons, at a cost of £950. Mr. Edward Titles, of Heworth-lane, is the architect, and Mr. Minto, of Hebburn, the contractor.

BUILDINGS.

Morecambe is about to be improved by the construction of a new pier. It will be 950ft. long, and generally 20ft. wide. The pier is the property of a company, and will cost about £10,000.

From Australia we hear that a new Mechanics' Institute has been completed at Geelong, at a cost of £5,600. The style of the building is a combination of Italian and Greek. It covers an area of 130ft. by 54ft., and comprises hall, lecture room, reading room, library, class rooms, offices, and private apartments.

A new cemetery has been completed at Clayhills, near Tunstall, and the Anglican portion was consecrated last week by the Bishop of Gibraltar. The cemetery was designed by Mr. R. Dain, architect, of Burslem, at a cost of about £4,000, and covers over seven acres. Chapels will shortly be erected.

Mr. Charles Brook, of Enderby Hall, has offered to build and endow a convalescent hospital in connection with the Huddersfield Infirmary, at a cost of £30,000.

On the 24th ult. the foundation stone of a new Masonic hall was laid at Belfast. Mr. John Lanyon is the architect.

New public baths, built by the Corporation, were opened at Blackburn on Saturday week.

A new post office is to be built in the High-street of Weston-super-Mare, and the foundation stone was laid last week. The building is to be erected by Mr. Harford, contractor, from designs furnished by Mr. Hans Price, architect.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

RECEIVED.—I. I. R.—B. N.—W. I. T.—I. F.—I. C. I., with MS.—E. G. R.—G. and Co I. F.—R. L.—T. B.—E. W. P.—I. A. H.—O. W. D.—I. B.—I. T. D.—C. R. and Co.—H. S.—I. H.—I. R. B.—P. and B.—I. G. P.—E. W.—K. and W.—I. W.—H. B.—I. B.—H. L. L. A.—I. S.—A. G. H.—A. C.—I. K.

I. T. When stones are worked in regular beds and joints and are dressed for facing work they are called ashlar.

"Peter's" communication throws no additional light on "bolted girders."

I. T.—Under the Nuisances Removal Act, 18 and 19 Vict., c. 121, sec. 26, the sanitary inspector appointed under that act is empowered to seize unwholesome meat &c., exposed for sale, and a justice of the peace may order it to be destroyed, and the owner is liable to a penalty of £10 for each carcase, &c.

Correspondence.

EXHIBITION OF STUDENTS' WORKS. KENSINGTON MUSEUM.

To the Editor of the BUILDING NEWS.

SIR,—The works forwarded by the students of the Kensington School of Art and its branches for national competition are now exhibited in one of the galleries of the above building, and are well worthy of a visit, although there is little or no improvement whatever on the last year's exhibition, which reflects very little credit on the masters, though the cause of the apparent failing to a great extent lies in the mistake that no student shall compete again in the stage in which he has once been successful, thereby giving no encouragement to the student who would wish to attain perfection, for no juvenile cares about working for twelve months at a drawing or design if there is no chance of a reward, and if to receive a prize is his ambition, his mind must be directed to another stage entirely out of his sphere, and for want of sufficient study he naturally fails. Can a person who has for a few years been studying from the antique models and oil paintings be expected to compete in architecture with advanced pupils from architects' offices? No; therefore the principle upon which the national art schools are working is wrong, and excuse must be made for many of the unawarded designs now exhibited. However, to return to the works, I select the architectural stage first. The principal drawing is that by W. E. F. Clarke, age twenty-four—a design for a church, or, to use his own expression, an attempt to apply the dome to Gothic architecture. The plan, of course, is cruciform with a dome at the intersection of the transept, with nave. Throughout the whole design truth is preferred to economy, which is a very sensible preferment in the present instance, and in one point especially does Mr. Clarke deserve great praise, that is, his protesting against the old sham principle of an inner roof of stone and an outer of wood and slate. In this case the groining and the roof are one, but here look very ugly; another ten feet to the clerestory and an addition of gablets into the roof would be an improvement, and also the removal of the bell tower. However, I hope the idea of a dome to Gothic churches will be followed not only by students but by architects in practice, who seldom, if ever, attempt to apply a dome to that style of architecture, but with one exception, viz., the National Gallery and Law Courts competition, which undoubtedly were Mr. Clarke's models, judging from the similarity between them; however, Mr. Clarke was awarded the gold medal, and considering the age, I should expect something better. The silver medal was awarded to Mr. T. Patchett, for a design for a townhall, represented by the most carefully-prepared drawings, with the exception of perspective, which is very tame indeed, and spoilt by a badly-proportioned, ill-designed dome. Mr. Patchett, nevertheless, is well worthy of his reward, and his drawing of close inspection. The bronze medal it has been thought fit to award to Mr. Edwards (age twenty-two), for a measured drawing of two or three bays of Lincoln Cathedral, carefully drawn—nothing more. A design for a villa in brick, with a quantity of timber, by Mr. H. Price (age seventeen), is really very good, and tastefully got up, and, in my opinion, deserves a bronze medal, but, to my great astonishment, receives nothing. It must either have been overlooked or sent in too late, for surely Mr. Redgrave could not let such drawings go unrewarded. Mr. Chapham received the national prize books for design for a villa of very insignificant design, though the draughtsmanship is very good. Prize books have also been awarded to Mr. Woodsend for a design for a villa; such a design! and also to Mr. Willmott (age seventeen) for a measured sketch of an altar, pulpit, Litany desk, &c., designed by G. Street; and prize books also to Mr. Jones (no age mentioned) for a design for the upper part of a tower. Judging from the subject and detail, he must be quite a junior. Mr. A. Foster exhibits a measured sketch, also of Lincoln Cathedral. I believe that gentleman got the national bronze medal last year for a measured sketch of the Chapter-house of the same building, much better executed than the present drawing. I advise him to measure some other cathedral or edifice, or we shall get sick of it. Poor Mr. Dunster (age twenty-five), who sends a sketch design for a museum and art school, though an architect's assistant, seems quite in the rear.

A gold medal has been awarded to Mr. T. Cox (age twenty-one) for a set of church furniture, but as it consists of an altar, reredos, pulpit, &c., it is as much architecture as furniture. It has many nice bits, but which recommended the gold medal

I cannot for my life conceive. However, believing I have described all that is exhibited in the architectural section—I am, &c.,

H. A. G.

THE ART OF BUILDING IN CONCRETE.

SIR,—Will you permit me to make a few remarks upon your impartial article on my patent concrete building apparatus, which in one or two points is the same as several of my correspondents, who have, with the purest motives, suggested many improvements in theory, but when met with the practical experience have acknowledged themselves in error.

From my previous correspondence with you I am satisfied you will be just in at once acknowledging the impracticability of your suggestion which you apply in the following words:—"We cannot, however, but consider that a large portion of the timber in it might be advantageously replaced by iron." This suggestion I have carried out, which has proved a total failure, and I will give you the result. Firstly, a timber rail 15ft. long, 3¾in. by 2in. red deal, weighs 1½lbs. per foot, and an angle iron rail 1¼in. by ⅛in. weighs 2½lb. per foot, so that a wood panel of two rails 15ft., 3¾in. by 2in., and the middle rail 2in. by 1¼in. would weigh 55¾lb., but if in angle iron it would weigh 103¼lb. From this you will see the advantage of the wood panels over the iron where portability is so essential. And, secondly, you must be well aware that in attaching the zinc lining to an iron frame it must be soldered, and in the buckling of the zinc plates no soldering would keep it in its position to a bar of 1¼in. by ⅛in. angle iron; and again, on the 15ft. panel being taken from the concrete work and laid on the scaffold until the corner pieces and separating pieces are being removed, the labourer is likely to lay one end of the panel on a block or other material and then step upon it, which in iron 15ft. long would bend, and hence involve time and labour to strengthen it again, when if the panel is wood it would spring to its proper position.—I am, &c., J. TALL.

TECHNICAL EDUCATION.

SIR,—A meeting convened by the Pimlico Amalgamated Society of Carpenters and Joiners was held in the schoolroom of St. Gabriel and St. Saviour, Pimlico, on Friday evening, July 17, the Rev. B. Belcher, M.A., presiding, at which Earl Granville and other gentlemen were present, to inaugurate the establishment of a school for technical education amongst carpenters and joiners by the above society. Earl Granville highly approved of the object, and hoped it would receive the encouragement it deserved. Mr. R. Trollope, of the eminent firm of Trollope and Son, spoke of the value of a scientific education to working men as tending to increase their skill and consequently their wages. Captain Oldershaw and other gentlemen followed, and it now only requires a little support in the shape of books, drawings, &c., to give the school a fair prospect of success.—I am, &c.,

GEO. GINN.

13, Lincoln-street, Chelsea, July 21.

THE NEW NATIONAL GALLERY.

SIR,—If, as is supposed, the new National Gallery was given to Mr. Barry as compensation for the loss of the Law Courts, the arrangement, however satisfactory from a red tape point of view, was scarcely a correct way of determining an art question. The choice of the design published in last week's BUILDING NEWS I consider most deplorable. Though not a great admirer of any of the designs submitted in the National Gallery competition, yet for convenience, economy, and art merit Mr. Murray's design for the conversion of the existing building appeared to me vastly superior. Mr. Barry's new design appears like a *rechauffage* of old city structures—St. Paul's, Bank of England, and Mansion House, and not the slightest hint is given of its intended purpose as a picture gallery. From the necessity of top lights one would expect a picture gallery to have its uses plainly marked on its exterior, but in this design the attempt appears to be to nullify any such idea; the five domes, with their wide-spreading podium, appear to cover the greater part of the roof, and the enormous area beneath them must be lost to all purposes of picture exhibition. The wonder is where the pictures are to go. As a common sense question I should like to know what domes have to do with a picture gallery. A moderate-sized one over the entrance hall or staircase would be reasonable enough, but what excuse can be made for five? They are worse than useless, for, costing a vast sum of money, they are utterly at variance with the intended uses of the building. Better far the present much-abused but unpretending work of poor Wilkins than Mr. Barry's costly, piled up agony of pretentious inconsistency—a design only improving by those gross, exaggerated features for the which there is no reason or shadow of excuse.—I am, Sir, &c., M.

BUILDING SOCIETIES AND STAMP DUTIES.

SIR,—Permit me to call attention to the bill now before Parliament to amend the law relating to Inland Revenue, sec. 10, wherein it is proposed to take away the exemption from stamp duties hitherto enjoyed by building societies on all mortgages under £200.

As solicitor to upwards of twenty building societies of different principles, the members of which comprise all classes, but the majority of them being poor, and to whom every shilling is of consequence, I think every person ought to use his influence in opposing or causing the bill to be opposed in its present form.

The present Government ought not to wish to pass a bill affecting the interests of so many poor people without giving them an opportunity of being heard.

If the present bill is passed it would, in my opinion, materially retard the beneficial results of building societies, which are one of the great improving features of the present age.—I am, &c.,

T. F. PEACOCK.

111, Gower-street, Bedford-square, July 21.

SLOUGH CHURCH.

SIR,—I hope the letter of "One of the Competitors" in this matter will bring the referee's report before the public, so that we, as competitors, may be satisfied that justice has been done to all parties. Our designs ought to have been returned long ago if not accepted.—I am, &c.,

July 22. ANOTHER COMPETITOR.

KITCHEN SINKS.

SIR,—I have found it a good plan (to prevent unpleasant smells arising during the night from interior sinks) to cover up the traps with flannel kept down by a weight and filling the trough with water. You noticing this in your next issue may add some little comfort to your subscribers this hot weather.—I am, &c., J. G. BROWN.

Intercommunication.

QUESTIONS.

[929.]—MATHEMATICAL QUERIES.—Will any of your correspondents kindly inform me of the shortest, and at the same time exact, known method of finding the square of any whole number contained between ten and one hundred. Also, a method by which accurately, and with the fewest figures, it is possible to find the length of the side of an octagon from the diameter or radius of the inscribing circle.—A. P. B.

[930.]—QUANTITIES.—I am an architect's assistant, and am often much pressed by builders to take up the quantities of different building jobs for them. Will any of the readers of the BUILDING NEWS, who are conversant with the law on these points, kindly tell me to what extent I may render myself liable (not being a professional surveyor) in the event of any mistake existing in the bill of quantities?—S. M.

[931.]—RECTILINEAL METAL BEAMS.—Would you allow me to request to be informed of some simple formula for calculating the strength of rectilineal cast metal beams when the proportions of top and bottom flanges are as 1 to 6, and the weight equally distributed over the beam. Also, what proportion should the maximum load bear to the breaking weight. In the event of a beam of the above description being calculated to bear a given load as above, what would be the section of a built wrought iron beam to bear a similar load, and a simple formula for calculating it, and what proportion would the load bear to the breaking weight.—AN INTERESTED ONE.

[932.]—MASTIC CEMENT.—Would you allow me, through "Intercommunication," to request information as to the nature and properties of mastic cement? First, what is it composed of? I believe it is generally used with boiled linseed oil, but sometimes with water. Second, if it sets with either, why is oil used? If the oil is better, what is the chemical action? Third, what is the meaning or origin of the term "mastic"? We hear of gum mastic, mastic varnish, &c., but why is the cement called so.—AN INTERESTED ONE.

[933.]—WASHING PLASTER OF PARIS CASTINGS.—Would any of your readers kindly inform me, through your "Intercommunication," what is best to wash a casting of the Last Supper, made of plaster of Paris, so as not to fill up the niches? I want it white.—X. Y. Z.

[934.]—TECHNICAL EDUCATION COMMITTEES.—Can any of your readers tell me what has become of the Technical Literature Committee and the Workmen's Technical Education Committee, connected with the Working Men's Clubs? Reports of several meetings of the former appeared in the BUILDING NEWS in November and December last year; and the latter was represented to have been appointed to give expression to the working men's pleas, with the view of assisting the deliberations of the Government; but I have heard nothing of its mission since it was appointed. There was another committee also formed, I think, by the same society, on the subject of Play Grounds for the Children of the London Poor; and still another, on the Adulteration of Food. These committees would strengthen the claims of the Club and Institute Union to public support, and prevent much misapprehension in the future, if the public could hear aught of their inquiries and operations.—J.

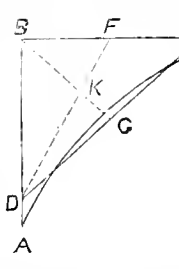
[935.]—REMOVING OLD STAIN AND VARNISH FROM FRAMEWORK.—I should feel obliged if any of your correspondents would give me the best recipe for removing old stain and varnish from framework, so as not to injure the wood.—A SUBSCRIBER.

[936.]—THE WEATHER AND COAL.—Does coal suffer deterioration from exposure to the weather? If so, in what way and to what extent?—PHOSO.

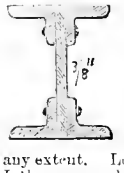
REPLIES.

[902.]—STRENGTH OF CYLINDERS.—Your correspondent "P. S." means probably "by hollow iron cylinders of a circular form" hollow globes or spheres, and the question resolves itself into one of determining the resistance of it to an internal pressure. If P be the pressure for unit of surface, R the radius of the sphere, S the coefficient of resistance, and T the thickness of the metal, the total pressure P^1 equals $P \times \pi \times R^2$. In order to ensure equilibrium, the total pressure must equal the resistance, which is equal to $\pi \times T \times S\,(2R + T)$, and consequently we have $P \times \pi \times R^2 = \pi \times R \times S\,(2R + T)$. Solving for T, we obtain $T = \sqrt{\left(\frac{PR^2}{S\,(2R+1)} + \frac{1}{4}\right)} - \frac{1}{2}$. For practical purposes, as a safe working load for wrought iron, S may be taken equal to 4,000, and for cast iron S = 3,000.—ENGINEER.

[909.]—THE CENTRE OF GRAVITY.—A geometrical method for finding the point K sufficiently accurate for all practical purposes may be thus worked out:—Let A B C represent the semi arch of which it is required to find the centre of gravity K. In the first place, by equalization (a common problem in plane geometry), make the area of the semi arch equal to the area of the triangle D B E by drawing the equalizing line D E. Then bisect the line B E in F, and draw D F. We know, mathematically, that the centre of gravity of the triangle D B E will be somewhere in the line D F. Again, bisect the line D E in G, and draw E C. Since the centre of gravity of the triangle will also be somewhere within this line, it will manifestly be found at K, the point of intersection of the lines D F and B G.—Q. E. F.



[913.]—IRON SEMICIRCULAR ROOF.—In answer to an "Engineer's Pupil," his section of rib should be that of an ordinary plate girder, as per sketch. To find, first, the strains, and then the quantity of metal required in the flange, it will be necessary to make an approximate estimate of the roof itself, which is easily done. The actual weight of the girder itself may be omitted in this calculation, as it will be very trifling, and will not affect the result to any extent. Let W equal the total load upon the arch; L the span, and R the rise; then the strain S in tons at the centre is $S = \frac{W \times L}{8 \times R}$; and the value of S divided by 5 will give the number of square inches of metal required in the flanges at the centre, or the number of square inches in the two upper angle irons and two lower, respectively, in the cut. The strain at any other point, and consequently the number of square inches of metal, may be found from the formula I gave in my last answer. It will be sufficient to find the strain at one other point near the springing, and if the sectional area be increased the depth of the girder may be constant throughout; or, instead of altering the size of the angle irons, the depth may be slightly increased towards the springing. For the girder in question, a depth of 18in. at the crown and 24in. at the springing would be sufficient; but this depends in some measure upon what the covering is made of, as it might be very heavy or very light. I recommend a plate girder, as it is stiffer, although not necessarily stronger, than a lattice one.—CALCULATOR.



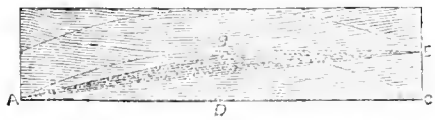
[918.]—FLUSHING HOUSE DRAINS.—In this very dry weather the waste water from the sinks is not sufficient to completely cleanse the drains from all solid matter, and hence the unpleasant smell complained of by "Tim." Mr. Allen, an authority upon these points, gives a very simple remedy for the evil. He says that the cleansing of the house drains may be effected at a very trifling expense by shortening about a couple of inches the waste pipe of the cistern, for as the water comes in from the main faster than it runs off by the waste pipe, the cistern would continue to fill till the rate of its coming in becomes exactly equal to the quantity running off, and this flowing and continual cleansing would last until the water was cut off at the main. Accordingly as the quantity of water that is required is much or little, so must the length of the waste pipe be adjusted.—S. S.

[921.]—WORKMEN'S INTERNATIONAL EXHIBITION FOR 1869.—The scheme of this exhibition is not abandoned. Some months since a salaried assistant secretary, altogether new to such work, was appointed and in the course of a few weeks a number of vice presidents and a guarantee fund of about £1,500 were obtained. Two months ago application for the use of buildings at South Kensington was made to the Science and Art Department, and the interval has been filled up in waiting for the answer from the Government.—A MEMBER OF THE COUNCIL.

[924.]—ARCS OF DIFFERENT RADII.—For the information of "Howell" I beg to hand you a method. To describe a segment, A B C, of a circle, by means of an angle, let A C, fig. 1, be the length or chord, and B D the

FIG. 1.

FIG. 2.



versed sine; join B A and B C; produce B A to E, and B C to F, making B E and B F of any length, not less than the chord A C. Prepare two straight edges, B E, B F, and fasten them together at the angle B so that their outer edges may form the angle A B C, and to keep them to the extent fix another slip, C H, to each straight edge at C and H. Bring the angular point B to A; then move the angle thus formed by the straight edges, so that the edge B E may always move upon the point A, and the edge B F upon the point C. A pencil being held to the angular point B, the segment of a circle will be described. Fig. 2, if you think proper to insert it, will explain itself.—PICK.

[926.]—REMOVING OIL PAINT FROM STONE.—I have practised with satisfaction a method lately made known by Mr James Fowler, F.S.A., which I think will satisfy "E. S. B." Dissolve in as little water as possible some coarse American pearlash, and apply with a tow mop. In twelve hours the surface will have partially dissolved into a thin paste, which may readily be removed with a whitewasher's brush and some water. Should any of the paint still remain re-apply the mixture. To prevent any injury to the stone from the alkali, add a little sulphuric acid to the last rinsing water. This method will not injure any stone, and the only difficulty in its application is where Roman cement wash, harder than stone, sticks so fast that the mixture is not able to reach the object of its attack. —K.

LAND AND BUILDING SOCIETIES.

THE fourth annual meeting of the City of Rochester and General Land and Building Society was held at Rochester on Monday week. The directors have the pleasure to state that the profits realised during the first year enabled them to apportion a sum equivalent to 6½ per cent. per annum compound interest, a portion of the profits being, at the same time, placed to the reserve fund of the society. The balance sheet, read by Mr. T. S. Warne, the secretary, showed that the total income of the society for the past year had been £7,442, including £3,519 received in subscriptions from borrowing and investing members, £1,683 on redemption of property in mortgage to the society, and £1,950 received on loan. On the other side of the account the sum of £4,725 had been advanced to members on freehold or leasehold securities, £455 to members on withdrawal, and £1,309 on repayment of loans. The report and balance-sheet were unanimously adopted.

WAGES MOVEMENT.

MESSRS. BUNNETT AND CO., the well known shutter manufacturers, have received a threatening circular, which for the sake of the trades' unions, we trust may turn out to be a hoax. The following is a copy:—"Messrs. Bunnett and Co. (Limited) Gentlemen We have to inform you that a resolution has been passed condemning the system of piecework as most obnoxious to trades' unions; and after the ensuing month, should you attempt to deviate from the tenor of this intimation, you must bear the consequences.—Yours respectfully, From the General Secret Committee, July 15"

Mr. Rupert Kettle, judge of the County Courts of Worcestershire, who has organised a system of Courts of Arbitration at Wolverhampton and Coventry, attended last week at Leeds as arbitrator in a dispute which has arisen between the master carpenters and joiners and their workmen respecting the rates of wages and the hours of labour. The views of both parties were placed before the arbitrator, and the result was that the men are to receive an advance of ½d. per hour in their wages, but that the demand for the reduction of the hours of labour was abandoned. It was agreed to appoint a court of arbitration to settle disputes that may arise during the next two years, and Mr. Jowitt was selected as the gentleman who is to be invited as umpire, should any dispute arise rendering his advice necessary.

The journeyman plasterers of Glasgow have hitherto been paid at the rate of 6d. per hour, or 2s 6d. per week At a meeting of the employers, on Thursday afternoon, the 9th inst., it was resolved to make an advance to 6½d. per hour, or of 2s. 6d. per week, to take effect at once, and continue for six months, after which the wages should be raised to 7d. per hour, thus conceding the whole demand of 5s. per week.

The master builders of Lymm, in Lancashire, have received a notice from their workmen expiring in eleven days, to the effect that an increase of 2s. and a reduction of 3½ hours a week is required. A strike is threatened if the demand is not complied with.

STAINED GLASS.

A NEW stained glass window by Messrs. Hardman and Son has been inserted in the parish church of Gosberton The window consists of three lights. Besides the tracery running through the three lower compartments, there is a representation of the Lord's Supper; above this the Crucifixion, the cross being a vine, with full-sized figures on each side of the mother of our Lord and St. John. In the tracery are figures of the patron saints of the church, St Peter and St Paul, and above all a striking figure of Christ in glory.

A stained glass window has been placed in St. Benedict's Church, Cambridge, by Mr. W H Constable, of Warwick. The window filled is the west, and consists of three lights, the centre one being the Ascension under a rich canopy, and at the base an angel bearing the inscription "I go to prepare a place for you."

A sixth memorial window has been presented to the parish church of Willesden. It consists of three lights, each containing a scene from the life of Joseph, and surmounted by emblems of his dreams and of Pharaoh's vision It is from the manufactory of Mr. Hughes, of Frith-street, Soho.

A memorial stained glass window has just been placed in St. Margaret's Church, Durham. The window is of three lights, and its pictures represent the leading scenes connected with the parable of the Good Samaritan. The glass was supplied by Messrs. Clayton and Bell, of London. The stonework of the window was executed by Mr Joseph Taylor, builder, Durham, from the designs of Mr. C. H. Fowler, architect, of the same place.

STATUES, MEMORIALS, ETC.

THE Thames Embankment is regarded as an excellent site for statues and drinking fountains. Noble's statue of Sir James Outram is, it is said, to be located on the embankment near the Houses of Parliament. A statue of Sir James Brooke will, when sculptured, be placed near it; and numerous statues now standing in inappropriate or obscure places will, it is expected, find final resting places on the Thames Embankment, thus becoming conspicuous national ornaments to the grand river esplanade. Let us hope all not yet executed may approach a little nearer to artistic excellence, and not, like the majority of existing London statues, disfigure the site they are meant to adorn.

A statue is about to be erected at Southampton to the memory of Lord Palmerston The site, which is in the Old Fairfield, fronting Marland place, has been marked out.

LEGAL INTELLIGENCE.

BREACH OF THE METROPOLITAN BUILDING ACT.—Mr. Frederick James Gribble, builder, of 27, Marquess-road, Camden-square, was summoned before Mr. Barker by Mr. Henry Baker, district surveyor of St. Pancras, for infringing the 20th and 26th sections of the Metropolitan Building Act, 1855. Mr. Baker said that the defendant had erected three houses on the west side of York-road, Camden-road, the eaves and cornices of the overhanging roofs, both in front and rear, being of woodwork, instead of brick or other fire-proof material. This practice was very much on the increase by builders in the suburbs, and the Metropolitan Board of Works had issued an order directing that proceedings should be taken in every case in which the board had not given permission for their erection. The defendant had failed to remove the timber and woodwork now in contiguity with the brickwork of the several flues and chimneys, up to Wednesday. The defendant said that if time was given him he would communicate with the Metropolitan Board of Works, who would give him leave to keep them as they were. Mr. Barker made an order for the work to be done in accordance with the terms of the notice. The defendant was then summoned by Mr. Baker for commencing three houses without having given due notice in writing, stating the situation, area, height, and intended use of such buildings, whereby he had incurred penalties amounting to the sum of £60. Mr. Barker made an order for the defendant to pay £2 2s. costs and £2 penalty. The defendant said he thought it was very hard, and asked for time to pay the money.

Mr. George Bransbury, a plumber and glazier at Littlehampton, Sussex, was summoned before the county magistrates at Arundel on Tuesday week for commencing the erection of a building without giving due notice of such erection to the Littlehampton Local Board. A fine of 10s. and costs was inflicted.

Our Office Table.

At the meeting of the Social Science Association at Birmingham in October next, one of the subjects selected for special discussion in the health section is:—What is the relation of the water supply in large towns to the health of the inhabitants?

The University of Durham have awarded the Whitworth Exhibition of £25 placed at their disposal by Mr. Whitworth, to Mr. John A. Bennion, of Manchester.

The seventh of the series of lectures promoted by the committee of the Leeds Philosophical and Literary Society, in illustration of the Fine Art Exhibition, was delivered yesterday week by Mr. J. C. Robinson, F.S.A., the lecture being on "The Old Masters, considered from Modern Points of View," and containing valuable suggestions respecting the formation of a Gallery of Art in Leeds

The *Medical Times* states that house vermin may be destroyed by introducing into the holes or cracks a few drops of petroleum.

Builders and joiners should be careful of their shavings this hot weather. Last week at Yarrow, N.B., a joiner's shop was set on fire by the sun. It appears that in passing through a pane of glass the rays of the sun were concentrated into a focus over some shavings. These being very dry eventually took fire; but the occurrence being soon discovered the flames were extinguished before any serious damage was done.

The municipal government of Paris caused a careful examination to be made last year of the remains of the Old Louvre, the fortified castle of Philip Augustus, which lie beneath the enclosed court or square of what is now called the Old Louvre, and it was found that the ideas respecting this ancient edifice were very erroneous. The base of the Donjon-tower, which figures conspicuously in history, was found intact, and only a few feet beneath the present surface of the ground. An admirable method has been adopted of recording the form of the ancient fortress; the entire ground-plan has been laid in black and white asphalte, except where the old building lies beneath the pavement of the present court, in which case granite has been used to represent the foundation of the old building.

The quarries of Carrara produce, besides the statuary marble for which the district is famous, another description of white marble, and a blueish marble, called bardiglio. Mr. Harries reports that in the course of three years, 1863-5, there were exported from Carrara 126,928 tons of marble, the average annual value of which was upwards of 1,000,000f. The export and other duties levied by the State amounted to about 80,000f. per annum. 2,238 persons, or about one-seventh of the whole population of the district, were employed in working the marble. There is a greater variety of marble in the adjoining district of Massa, but the elevated position of the quarries and the want of transport prevent them from being completely worked. Oriental alabaster is found in the Siena country. In the neighbourhood of Volterra there are 29 quarries, which yield annually 580,000 kilogrammes of alabaster of different colours and qualities. The alabaster statuettes, vases, and ornaments of all sorts that are sent from Italy to all parts of the world are made principally at Volterra.

The Streets Cleansing Committee of the Corporation of London have just reported their own experience of performing their own dusting, cleansing, and watering. The cost for the past nine months has been £16,559 3s. 2d., and the cost for the whole year is estimated at £22,078 17s. 6d. The amount paid under the contract system for the year ending Michaelmas, 1867, was £22,845 19s. 3d.; so that a gain of nearly £800 is expected in the first year. The committee is now seeking power to purchase its own horses, carts, and plant, as a great saving will thereby be effected.

A serious fire broke out the other day in the tower of Boyn Hill Church, Maidenhead. The heat was so great that two bells were melted, and two others fell on to the lower arch of the tower. The fire was fortunately extinguished in time, or all the bells, eight in number, must have been destroyed. The damage is estimated at from £500 to £600.

At the last meeting of the Marylebone Vestry a long debate ensued as to the advisability of extending Thayer-street, Manchester-square, to Oxford-street. The promoters of the scheme estimate the cost at something under £20,000.

Mr. William Hey, architect, of New Kent-road, has applied to the Court of Bankruptcy to annul his bankruptcy, he having paid in full every claim against him. The Commissioner made an order in accordance with the application.

The Metropolitan Board of Works is endeavouring to secure London Fields, Hackney, for purposes of public recreation.

The largest and most varied display of the works of the sculptor ever exhibited at the Royal Hibernian Academy is that of the present year. During former years very few objects met the visitor's eye on entering the sculpture room, but at this exhibition we find no fewer than 260 statues, busts, medallions, groups of figures, and other products of the sculptor's chisel, executed in marble, clay, and plaster. The largest contributor to this department is Mr Joseph Watkins, of Dublin. Mr. Watkins received the great national medal for the best specimen of modelling offered at the competitive trials at the South Kensington Museum, besides other honours awarded by the Royal Dublin Society and various art institutions. Among his contributions to the present exhibition are busts of the Archbishop of Dublin, Sir George Hodson, Bart., and Lady Hodson, the late Dr. Robert Sullivan, &c. The remaining works are from a large number of artists—Mr. Joseph Kirke, Mr. John Farrell, Mr. Thomas Farrell, Mr. Harwood, Mr. Stevenson, Mrs. Hill, Mr. Millard, Miss White, and Mr. Woodhouse.

The section of the Metropolitan Extension Railway which is to be constructed on the Thames embankment from Westminster Bridge to Blackfriars will be commenced immediately. The contractors for the works are Messrs. Lucas, Waring, and Co., who have constructed the line from Kensington to Pimlico, and beneath Victoria-street to Westminster, a great portion of which is finished. The *souterraine* through which the line will pass is to be constructed in the following manner, on account of the newly-made ground:—Deep excavations will be made, the side walls being of thick, massive brickwork, upon which the roof of ironwork will be fixed; shafts for the purposes of ventilation will be constructed at certain distances from each other, and the intermediate stations will in all respects be similar to those on the Metropolitan trunk line. Until the extension of the Thames Embankment is completed to Blackfriars, the railway works cannot be carried further than the Temple-gardens.

23,279 people, including season ticket-holders and those admitted by payment, visited the Works of Art Exhibition, at Leeds, last week.

The footway of the Northern Thames Embankment will be formally thrown open to the public on the 30th inst. by the Board of Works.

An artisans' conversazione at the South Kensington Museum is on the *tapis*.

Professor D. T. Ansted, M.A., F.R.S., Professor Robert Kerr, of King's College, and Dr. Edwin Lankester, F.R.S., have been added to the list of vice-presidents of the Public Museums and Free Libraries Association.

In the House of Lords on Tuesday evening, the Commons' amendments to the Artisans' and Labourers' Dwelling's Bill were agreed to.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

3428 R. PORTER. IMPROVEMENTS IN THE CONSTRUCTION OF METALLIC AND OTHER BUILDINGS. Dated December 2, 1867.

This invention has reference, principally, to buildings constructed mainly of metal, and consists, first, of the following method of constructing the walls of the said buildings. The patentee makes the said walls of corrugated sheeting, either of iron or zinc, the corrugations being situated vertically, and he supports and strengthens the said wall by means of standards made of metal, rolled or otherwise formed into a trough-like figure. The said standards are fixed against the corrugated walls in such a position that the edges of the said trough like standards fall into and lit against the bottoms of the corrugations in the walls. The standards may be made of a width proper to include two, three, or more corrugations. Along the interior of the walls, and nearly midway between the floor and roof, he fixes horizontal rails which may be made of wood, iron, or of both combined. The said horizontal rails are supported in brackets connected with the standards, the connection between the said standards and brackets being effected through holes in the corrugated walls. Horizontal rails of the kind described may also be fixed in a similar manner at any required height inside the building. The standards may be fixed inside the building, and the horizontal rails outside where required. The walls may be lined internally with a cheap description of paper board, such as mill boards, straw boards, and the like. He attaches the said lining by making it in sheets or panels, which are inserted in rebates or grooves of wood or metal fixed to the walls, or to the horizontal rails. The invention consists, second, of the following method of attaching the ridge caps on the roofs of metallic buildings, and other buildings having corrugated metallic roofs. On the summit of each side of the roof he fixes a strip of hoop iron, which has been corrugated with corrugations similar to those of the roof plates. The said strips of corrugated hoop iron are so fixed on the summit of the sides of the roof that the concavities in the said strips are opposed to the concavities in the roof plates, and there is thus formed a series of nearly circular spaces or openings. The ridge caps are fixed upon the said corrugated strips of hoop iron. There is thus left a series of nearly circular openings along the whole length of the ridge of the roof, by means of which the ventilation of the building is effected.—Patent completed.

PERPETUAL INVESTMENT and BUILDING SOCIETY.

The seventeenth annual general meeting of the members of this society was held at Radley's Hotel, Bridge-street, Blackfriars, D. Pratt, Esq., in the chair.

The notice convening the meeting having been read,

The SECRETARY (Mr J. E. Tresidder) read the report of the Directors and the annual statement of accounts. The report stated that the business of the last year had exceeded that of the preceding, and yielded a much larger amount of divisible profit than in any previous year. One thousand nine hundred and nine new shares had been issued, and a sum of £236,936 had been received for the purchase of realised shares bearing interest after the rate of £4 per cent. per annum, payable half-yearly. A sum of £18,505 8s. 1d., including interest, had been repaid upon shares withdrawn, and the amount invested in this department, inclusive of capitalised interest to the 30th April last, was £102,407 17s. 6d. A sum of £31,546 8s. 4d. had been received upon subscription shares, while £25,053 5s. 4d. had been repaid to shareholders, including interest upon shares matured and withdrawn. All subscription shares have been credited with the amount of interest due thereon, and the balance now remaining invested upon such shares, with the accumulation of interest and bonuses, was £148,339 6s. 2d. A sum of £5,313 13s. 1d., equivalent to a bonus of £6 per cent. upon all subscription shares entitled to participate, had been apportioned and credited to the several shares accounts. The bonus now declared, while equal to that of the four preceding years, was in the aggregate largely in excess of any previous year; but in consequence of the very large increase in the number of participants in the bonus, the per centage remained the same. A sum of £3,213 18s. 1d. had been received on deposit at £3 per cent., and the balance now remaining on deposit with the Society was £18,689 1s. 4d.; the total advances of the year were £74,3-8 19s. 6d. A sum of £15,871 1s. 11d had been received for interest upon loans during the year, and the balance now remaining due to the Society upon loans was £224,678 12s. 7d. The total amount advanced by the Society from its commencement was £670,305 8s 2d. The Directors had devoted considerable attention to the investment of the estates purchased at East Dulwich and Benhill, and they had also secured estates at Beddington, Epsom, and Muswell-hill. Upon the estate at East Dulwich a portion of the land had been let for the building of ninety houses, nearly the whole of which are completed. To facilitate the sale of houses to persons desirous of occupying them, the Directors had agreed to advance a large proportion of the purchase money at a reduced rate of interest, thus enabling the investors of the Society to become their own landlords upon advantageous terms. Upon the estate at Benhill thirty-two houses were in the course of erection. Plots of land upon either of the estates could be secured upon application at the offices. It had been decided that portions of each estate should from time to time be offered for sale, the purchasers having the option of paying the purchase money by quarterly or half yearly instalments; and the Directors had full confidence that the gradual development of this department of the Society's business would tend greatly to promote the general interests of the shareholders.

The CHAIRMAN in moving the adoption of the report, expressed the regret which he felt at the absence from the chair of Mr. Gover, who had hitherto filled that position, and who was known to the members of the Society for the energy and ability with which he worked for their interests during the last seventeen years. Referring to the progress of the Society he said he was entitled to congratulate the members upon the satisfactory character of the report submitted by the Directors, and it required very few observations from him to commend it to their approval. It was, indeed, so favourable in every respect, that he had no doubt it would be adopted with acclamation. A Society which had advanced during the year, upon the best security, no less a sum than £72,000 was certainly a very large and flourishing institution, and the members might well be gratified at the prosperity which had been attained. It was satisfactory, too, to find that the Society was not one that had ceased to attract public attention, for during the past year one thousand nine hundred and nine new shares had been issued, and the other business transacted was of an equally extensive character. The total amount now out upon loan was £224,000, and this Society had advanced, altogether, since its commencement nearly a million of money. It might, therefore, be fairly said to have achieved a great success, and to those who were Directors of the Society, as he had been from its foundation, it was a source of much pride and gratification to find that it had realised all that it had promised at its outset. The first thing necessary to the success of a Society like theirs was a sufficient amount of capital to carry on their business. He was glad to say that, in this respect, they were well supplied. Indeed, the difficulty which they had was to know how to employ the money which they received so as to make it reproductive. Next to an ample capital they wanted trustworthy management in order to make the institution flourish: and speaking for himself and the other members of the Board, as well as for the secretary and staff of the Society, he maintained that no society could be conducted with more prudence and economy and sound judgment. It was content to divide only what had been well earned; and by that means, and by adapting itself to the wants of borrowers, and charging them a moderate rate of interest, it secured the confidence of the public; and many who availed themselves of the accommodation which it afforded were so gratified that they came to the office to thank the Secretary for the benefits they had received through the agency of the Society. With regard to investors, he did not hesitate to say that the security offered by the Society was equal to that of the Bank of England. All its loans were made upon freehold or leasehold property, which was carefully valued before being taken as security; and though it might sometimes make a loss of a trifling character, the Board always saw that the amount was written off the moment it was ascertained, so that the value of the securities was not affected. It should be remembered that all the Directors were investors themselves in the Society, and their interests were therefore identified with it, and nothing which they could do would be wanting to promote its prosperity. Another feature in the Society which materially helped to promote its success was its established reputation, and with such distinguished characteristics as an ample capital, trustworthy and economical management, adaptation to the wants of all classes of borrowers, perfect security to investors, large bonuses to members, and an established reputation, he had no doubt that the Society would go on extending its business and increasing in prosperity. A dividend of 10½ per cent, at a time the Bank rate was only 2 per cent, was something to congratulate themselves upon, and he therefore asked them with great confidence to adopt the report.

Mr. HUDSON, jun., said he had no objection to adopting the report, but thought the remuneration of the directors was too large, and hoped a reduction would be effected. It appeared to him that the amount was out of proportion to the total expenditure.

Mr. GOVER said the question to be considered was not whether the amount was out of proportion to the general expenditure, but whether it was too much or too little. He was of opinion that if Mr. Hudson was acquainted with the machinery for working the society and the amount of work performed by the directors, he would not think of objecting to their remuneration.

Mr. HUDSON, sen., said the remuneration of the directors was more than was given in many other companies of a much higher character. He also referred to the way in which the Sutton Estate had been allotted, and said that the best plots had been given to the directors.

The SECRETARY explained that the estate had been allotted by ballot, and no plots had been given to the directors except those which they had drawn. There was no favouritism whatever displayed.

After some further conversation the report was unanimously adopted.

The retiring directors, Messrs. Thompson, Silvester, and Freeman, were then re-elected, as was also Mr. W. H. Millar, the retiring auditor.

A resolution was then submitted by Mr. HUDSON in favour of a reduction of the remuneration of the directors, but on a division only seven hands were held up in its favour, and it was consequently rejected.

A vote of thanks was then passed to the directors for their services during the past year, and Mr. GOVER acknowledged the compliment.

Mr. BURTON moved a vote of thanks to the secretary and staff, and Mr. BURGESS seconded the motion, which was agreed to.

Mr. TRESIDDER, in reply, thanked the meeting for the cordial way in which the vote of thanks had been received, and made remarks upon the gradual growth of the society to its present position, which he said was due to the great care and attention bestowed on its management by the directors.

A vote of thanks was next passed to the solicitors and acknowledged by Mr. WATSON, and a similar compliment was passed to the chairman, and the meeting then terminated.

THE BUILDING NEWS.

LONDON, FRIDAY, JULY 31, 1868.

ENGLISH WOODS AT THE ROYAL AGRICULTURAL SHOW.

AMIDST the mass of material exhibited by those interested in the science of cultivation at the Royal Agricultural Society's show in Leicester, we noticed a splendid collection of English-grown woods. From their uniform character, classification, and high finish, they monopolised a large share of attention. Perhaps with the exception of the refreshment booths, which absorbed the first attentions of the visitors during those remarkably hot days, there was no other spot so well attended. This might be attributed to the owner of the collection, who was no less a personage than his grace the Duke of Rutland. The woods exhibited were not arranged to show the splendid quality of the Belvoir grown timbers, nor to illustrate eccentricities or failings of growth in their youth or age, but to make public their adaptability for manufacturing purposes, and their beauty in grain and figure when adorned with the lustre imparted by the modern race of polishers in wood. Our English-grown woods have been much neglected; those of a useful character are too limited in quantity to maintain their importance in the face of the mass of foreign-grown timber which is daily landed on our shores, and those of an ornamental character have long since fallen into disuse. The fashion for using foreign woods of bright and transient colours, aided by the charm of french polishing, has supplanted our native-grown woods, with their unassuming lustre under the old wax or oil polish. In the short space of half a century we have forgotten all that our grandfathers knew upon this subject, and we are astonished to find samples of English-grown woods possessing beauty of figure and brilliancy of colour. As yet we have heard of no other collection of a similar character, and from its novelty and useful bearings we are led to give it a welcome notice.

The woods under notice have been collected and arranged under the immediate supervision of Mr. James Parker, chief forester to the Duke of Rutland, and they form the major portion of that gentleman's museum of arboriculture at Knipton, in the Vale of Belvoir. As lord of the forest the oak claims our first notice. Along the walls we are presented with polished specimens, showing its clearness of growth and adaptability for manufacturing purposes. They are all specimens of the *Quercus pedunculata*, or hard variety of English oak, which grow to such noble size on the fertile slopes of the Belvoir hills. We have, also, specimens of the brown oaks—some rich in medullary figure; others, known as the pollard variety, remind us of the best specimens of Italian walnut. For furniture and dining-room fittings brown and pollard oaks are becoming extremely popular. In every case, when naturally coloured, they are the produce of old ancestral trees. They are scarcely ever felled on our English estates; but time and the fierce blasts of winter topple them over, and so they fall into the hands of our cabinet makers and ecclesiastical wood workers, by whom they are highly prized. Other specimens showed peculiarities in growth, attributable to the nature of the ground upon which they were grown, and are known as the "Croxton Park Oaks." Here the oak timber is worthless, as every tree growing upon that high table land, which is composed of oolitic iron-stone, is shaked from the root to the topmost branches. This wood is unnaturally hard, and the effects of swelling and shrinkage, in conjunction with the severity of the frost in that elevated district, split the wood in every direction. The ring and heart strakes admit stagnant air to the interior, dry rot ensues, and the trees, if not cut down, naturally fall before they have become thoroughly matured. Mr. Parker assured us that a sound oak tree had never been felled upon that portion of the duke's estate. We noticed fine specimens of the ever green and Turkey oaks. The ash (as with the other useful woods) was exhibited in planks both plain and polished. Its size and clearness were remarkable. Selected specimens of "ram-horned" and "figured ash" were shown which were highly beautiful. Since the introduction of "Polish ash" for ornamental furniture ash has become a great favourite. We were astonished to find specimens of of English-grown ash in the collection as clear and beautiful in figure as the celebrated "Polish ash." The specimens of mountain ash showed a marked distinction from the common ash. The elm also played an important part; its size was exhibited in plank specimens, and its beauty in panels and cabinet specimens. The English and Scotch varieties were defined by the former being lighter and closer in its grain than the Scotch or broad-leaved elm, but all the pollard specimens, which were so beautiful in grain and depth of colour, were the produce of the latter variety; indeed, it is highly questionable whether the English elm is ever pollard.

Amongst the woods remarkable for their grain and figure, we noticed the following:—Walnut, both the common kind and black American (which does well on our English soil), Portuguese laurel, pear tree, plum tree, yew, buckthorn, and common crab, all of which partake of red and its nearest compounds. Yellow, in like manner, was represented by the alder, acacia, Spanish chesnut, and cherry (both wild and cultivated). Amongst the lighter coloured woods we noticed the holly, horse chesnut, and sycamore, the latter being a beautiful specimen, clearly white, and polished without the introduction of stain or colour. This specimen was very suggestive, from its silky lustre, for light furniture as for panel work.

The pine family, which produces our most useful timber, was well represented. The Scotch fir was somewhat open grown compared with the foreign-grown timber of commerce. With the spruce, its resemblance to the Norway and Riga white woods was close indeed. The Weymouth or Quebec pine, which grows well on this estate, was somewhat open in its growth, being more defined in its grain, and more highly charged with resinous matter, than is common with that of Canadian growth. The specimens of silver fir and larch were remarkably fine. The latter, from its soft red colour, was greatly admired. In Gothic furniture it would be highly suitable for pierced or diagonal boarded panels, as it is forcibly marked in its grain, It would not be suitable for large plain surfaces where repose was needed.

The specimens of "Cedar of Lebanon" were much admired. Those who inspected them from sheer curiosity associated the wood with "Solomon in all his glory." "So that is cedar of Lebanon!" exclaimed one. Another would remark, "I thought it was red, like the cedar of our pencils." But they all admired its beauty of growth, or its soft brown colour, and regretted that it was so rare as an English-grown wood. These trees attain a remarkable size in the Vale of Belvoir. A section was exhibited close upon 3ft. in diameter. This section, along with a horse chesnut bur, were splendid pieces of workmanship. It is well known that sections of trees cannot be preserved in a sound condition. To obviate this evil they were cut off as veneers, and afterwards mounted and polished. The question naturally presents itself, Why are not our national and scientific collections so prepared, and why do we so rigidly adhere to using our ornamental woods longitudinal in their figure? As a curiosity we noticed a plank of "Arbor Vitæ." It strongly resembled our common red or yellow pine. As the "Arbor Vitæ" rarely grows larger than a shrub, a plank from such a tree may truly be termed a curiosity. The ordinary woods embrace the alder, apple, acacia, beech, birch, crab, elder, juniper, hawthorn, hornbeam, laburnum, lime, common and Portuguese laurels, maple, mulberry, plum, black Italian (male and female) poplar, Lombardy or upright poplar, plane, and pear tree. In all we noticed fifty-one kinds of woods; and some idea of the collection may be formed when we note they were exhibited in both plain and polished planks, and a great many of them were also shown in transverse sections. A high meed of praise is due to Mr. J. Parker for his energy and scientific attainments in perfecting such a collection, and praise is also due to the Duke of Rutland for affording facilities for the advancement of science and technical knowledge in connection with "English-grown timber."

DEVELOPMENTS OF NONCONFORMIST CHURCH ARCHITECTURE.—II.

LEAVING, then, for the present, the very large class of chapels in which the external design is more or less concentrated on a showy front, we will notice those in which some thought is bestowed on the work as a whole. It is of course understood that the form of plan still under consideration is, as before, a nearly unbroken parallelogram, wide enough to admit of side galleries. The first difficulty which here strikes anyone who aims at real mastery of the subject is what to make of the roof. An unbroken roof of fifty or sixty feet span on a low and short building is nothing less than an extinguisher to all artistic merit. It dwarfs and crushes everything beneath it, and refuses to combine with anything but the heaviest and severest detail. Before any sort of decoration can be attempted, the first necessity is, plainly, to remove the shapelessness of this crowning feature; to give the whole design, in short, some beauty of general form—some play of light and shade. The first idea that suggests itself seems to be that of putting gablets along the sides. This system has two advantages: it enables the top windows to be greatly enlarged, and it breaks up, in some measure, the vast and dreary expanse of slating. Hence it is not surprising that it should have come into very common use. But, like the device last noticed, the misfortune is that it is in danger of being made a substitute for thought. It is a "dodge" that very soon tires by repetition, and it has already been repeated quite enough, unless it can be advanced upon and developed. Fig. 11* shows a familiar instance of its application. There is a gablet over every bay, or sometimes over every alternate bay, of the side elevation. In the present example this redundance of gablets is further increased by making each front staircase into a piece of sham aisle. A row of small gables, however, unless bound together and subdued by some strong governing feature, is generally fatal to anything like breadth and vigour. It does away with the main horizontal lines of the building—those in the eaves' cornice or parapet—the contrast of which with the vertical members is almost as essential in Gothic as in Italian. And the more gablets there are the less telling they become. Three in a series are far more striking than five or six, for intensity of effect is not increased by multiplying salient points. In fig. 11, too, and in the class it represents, the huge roof still stands behind this fringe of gablets. It is not changed, it is only hidden in part. It rarely harmonises with them, and they as rarely harmonise with the unbroken walls. Something more is needed to conquer this first difficulty of a galleried

* See lithographic illustration last week.

building. In certain cases, however, another step has been taken by reducing the main roof. Instead of the overwhelming mass seen in the front of No. 11, it has been brought down to the proportions of the centre gable in No. 13. This is effected by starting it, not from the side walls, but from the gallery columns, and by continuing the roofs of the side gablets to meet it.* Variations on this arrangement may easily be invented. In fig. 13, for example, the side roofs are all equal in span; in fig. 12 a wide and narrow one are used alternately. But this principle, which has probably been adopted more often in Episcopal than in Nonconformist churches, seems capable of further expansion. Of its results in internal planning we may speak hereafter. Externally it brings the main roof to a manageable span, though it does not give height like a clerestory, and though the broken eaves' cornice and serrated gables are adverse to simplicity and repose. This last seems to be its most serious fault. If want of height in the roof were all, it might and ought to be made up for by additional height in the walls. One of the commonest faults in town churches of all kinds is that their walls are too low. They are looked down upon by the very dwelling-houses that adjoin them. Instead of holding their proper position by superior size and dignity of form, they seem as if they were built by a smaller race of men than shops and warehouses are. They are too often dwarfed in elevation and frittered in detail. No wonder that a strong prejudice against Gothic still exists among the non-professional public, for the Gothic they are most familiar with seems identical with all that is weak, tame, and puerile. This is bad enough in a village, where nothing but cottages surround it: it is ten times worse in a city crowded in by lofty buildings on every side. For the sake of dignity and impressiveness—for the sake of breathing room for the congregation—galleried churches, above all others, ought to be built a great deal higher than they usually are.

Another expedient often resorted to in contending against the crushing heaviness of a wide span roof is that in sketch No. 14. The rafters start from the walls at a low pitch, and some distance up the rake suddenly turn to a much steeper one. There is, in short, an internal angle on each side of the gable. This plan is sometimes adopted alone, and sometimes combined with the dormer system. At first sight it may seem promising, but there is a painful look of weakness about it as generally applied. In able hands, perhaps, it might be turned to good account. There are few forms so hopelessly bad that a man of original powers would be unable to deal with them, for form as well as colour is in some degree relative. Very much depends on the surroundings, on slight modifications and judicious contrasts. But in the present case, as in those before noticed, the effort to harmonise discordant features is too often wanting. The first idea is used and re-used in all its primitive crudeness. It is taken, not as a good basis for further thought and invention, but as a fixed recipe, to be mechanically carried out. Now rested on so, neither the present nor any other device will do away with the difficulties of chapel design. The faults of this one seem to be that its outline is concave and suggestive of sagging in the rafters; that it does not, after all, give a marked and effective break to the great surface of tame, textureless slating; that it leaves an awkwardly shaped gable in the front, and is too light, not to say fantastic, to agree well with a building of unbroken oblong form. These objections are not stated as reasons for its entire disuse, but for a more careful study of the compositions in which it is introduced. In certain examples, indeed, a very narrow strip of walling, carried by the columns below, divides the steeper from the flatter parts of the slope. This helps to remove the boneless, unmuscular look that a large roof is apt to have, but within the building it leads to all the faults of a clerestory without its advantages.

The next example (No. 15) shows the usual extent, in Nonconformist churches, of attempts at wooden or other light clerestories. The forms adopted—fig. 16, for instance—have generally been mere reminiscences of stone tracery. Scarcely any of them can therefore be found which are successful artistically. Yet the great advantage of a range of windows in this position for light and ventilation might well warrant its further trial. If the gallery columns go up, as they so often do, to support the roof, it makes no difference to the question of sight and hearing whether they carry some modification of a clerestory or not. A good upper light is so valuable that it is a pity to lose it when it can be readily obtained; and windows high above the audience can be freely opened in hot weather without being angrily shut again, as lower ones generally are, by some fancied invalid near them. Where stone clerestories are placed on iron columns there is usually, indeed, a compromise far from satisfactory. The stonework is much too thin for strength, and the columns so thick as to be much in the way. By studying each case separately this might, perhaps, be in some degree avoided. The unpleasant fact would, however, still remain, that cast iron, once heated to redness, cannot even bear its own weight, and a very small outbreak of fire near a main column might thus bring down all the arches of the building. The possibility may be remote enough to be worth risking; but in the case supposed, a framed superstructure would probably suffer far less by the failure than a stone arcade. In trying, however, to develope the principle now under notice, the first thing is to break loose from previous practices and prejudices, to work the system out on rational principles towards its actual aim and purpose. The advantages to be sought are light and air within—height and dignity of proportion outside. The problem is to gain these without inconveniencing the congregation, and without falling into weak or temporary construction. A deep clerestory with an open roof above is, as many modern churches prove, a very bad arrangement for sound. The voice seems to be lost in the central space over the windows; but a very narrow band of lights placed near together under a boarded ceiling of any appropriate form, would be entirely free from this objection. A number of small apertures here, carefully guarded from producing down-draughts, would be a great advantage in hot weather. Ventilation, it is often forgotten, must be carried on in different ways during different temperatures. In the winter time a few small holes may carry off the foul air of a heated room effectually. On a hot summer's day the direct admission of the wind is the only practicable means. For this reason it is always desirable to have a number of windows capable of being thrown wide open. The small hoppers and sliding squares in which "Chapel Gothic" delights are next to useless when they are needed most. A range of openings in the nature of a clerestory would be a most welcome addition. Next to theatres, Nonconformist churches are almost the worst ventilated class of public buildings. Any plan for giving them a little fresh air deserves consideration. In some temporary structures of large size a system resembling that suggested has been found to work well; but it needs to be refined and translated into more permanent construction. Anything like a copy from the clerestory of a mediæval church would be absurd and inappropriate. The feature suggested would have to be *designed* for the purpose—an insurmountable bar to its adoption in certain schools of chapel architecture. If stone or brick can conveniently be used, so much the better; where these are inapplicable it may be worth trying if no lighter material will serve the purpose.

The triple roof—a variety of which is shown in fig. 17—has now and then found a place in wide chapels. There is a well-known practical objection to it on account of the long gutters which it involves, which, when choked with snow or leaves, are liable to overflow into the interior. Extra width of lead outside, and a boarded ceiling within, would, of course, lessen this failing, which a little contrivance might altogether remove. The arrangement might then receive more attention than it has hitherto done. It has the merit of giving a manageable form of end elevation, admitting great variety of proportion. It is free from the crushing expression of a wide single-span roof, though it has some tendency towards that small prettiness which is the weak point of much English Gothic.

We have thus examined some of the principal ways in which the roofing of a wide galleried church has been hitherto managed; the plan being supposed to be similar on the whole to that of No. 1 in our last illustration. This plan, however, is far enough from perfection. It happens to be one which Nonconformists have received from their ancestors, and which they have in many cases perpetuated almost unaltered. Their efforts have been spent very much on decorating it outside and in, and very little in revising or improving it. Externally it presents a very unpromising subject to work on, while within it needs radical changes. In continuing these papers it is intended to notice some plans which have been or might be used in lieu of it, and to say something more of internal design generally.

* By a slight error in the shading of the lithograph, these gablets look in the side elevations of figs. 12 and 13 like mere dormers springing from the base of the main roof. They are, however, in reality short transverse roofs, with gutters between them, joining the main roof some 12ft. or 15ft. within the walls.

NATIONAL PRIZES, SOUTH KENSINGTON.

LAST week we gave some account of the objects in competition for these prizes, and published a letter from "H. A. G.," calling attention to the architectural drawings. In stage 23b, architectural design, E. F. Clarke, of St. Martin's, obtains the gold medal. The subject is "An attempt to apply the dome to pointed architecture." In this work there is nothing new, and neither the design nor the execution entitles it to so high a prize. J. Woodsend, carpenter, Nottingham, age eighteen, receives "books" for a very creditable drawing of a bad design. Eugene Clepham, builder, and a South Kensington student, also receives books. This drawing has many faults; the shading is softened off till it resembles the old-fashioned Poonah painting. The effect of the pen is mixed with that of the brush, and is not carried through. The plan is not positively bad, but the elevations are. No prize should have been given in this instance. A design for a private residence, by H. Pryce, aged seventeen, South Kensington student, is very creditable, and should have been rewarded. Thomas Cox, age twenty-one, Birmingham, is another gold medallist. The work is neat, but shows no signs of *drawing*—no touch, no effect, in some of the shadows great carelessness, and in all more or less dirt. A nicely bound book, with pictures inside, would have been a more appropriate reward than a national gold medal. W. Edwards, age twenty, Lincoln, gets a bronze medal for a very careful drawing. He has evidently studied Sharpe's Parallels. H. J. Wilworth, age seventeen, Warminster, receives books. He will certainly make an excellent draughtsman. The architectural drawings are, as a whole, very indifferent. In stage 23a, mechanical drawing, R. B. Mowbray, Chester, is awarded a bronze medal for a drawing of a locomotive, as is also R. G. Morton, Dundee, for a depiction of some machinery. This drawing shows a great waste of time in representing the grain of the wood and similar trifles. E. C. Hocking, black-

smith, Truro, age twenty, exhibits a very neatly shaded drawing in Indian ink. He receives a prize. T. L. Phipps, Birmingham, is successful with a drawing of a rifling machine. He shows a thorough knowledge of the true projection of shadows, but there is no life in the drawing; and, as he might have made the machine in probably less time than it took him to make the drawing, we cannot see that he has been spending his time profitably. All the machine drawings are examples of misapplied industry on the part of the pupils and bad teaching on that of the masters. In stage 11, "Painting ornament from the flat or copies," Joseph Turner, age twenty-seven, Gloucester, receives a bronze medal. He will never set the Severn on fire. Stage 22a, "Studies treating natural objects ornamentally," is very interesting. Given spaces are to be filled with an ornamental arrangement of natural objects. This is *design*, and if the art schools do not succeed in producing designers, they will have failed in great measure in realising the hopes that have been formed of them. Books are awarded to Sarah M'Gregor, Bloomsbury, and to E. Perry, Birmingham, age nineteen—occupation, teacher. We have no wish to be hard on the latter, but a teacher, even if only nineteen, should produce something better than a boarding-school plaything to be taken home at the holidays. W. Stanley, Birmingham, decorator, obtains a bronze medal; his design is clever, but the design of R. Young, Nottingham, age twenty, solicitor's clerk, rewarded with books, is better. W. Watson, age sixteen, also gets books, and he deserves them. In stage 23c, "Applied designs, technical or miscellaneous studies," under the head "surface designs," Alfred Honey, age eighteen, Glasgow, sends a good design for a scarf, but he is unrewarded. The silver medal is taken by W. G. Murray, Dublin. Bronze medals fall to R. Gates, Lambeth; F. Hall, Macclesfield, age sixteen, card cutter; S. R. Stevenson, Nottingham, age seventeen; Joseph Harris, South Kensington, design for a lace lappet; and A. Harrison Goodall. We cannot pass unnoticed a design for poplin by Miss Isabella Bevin, Dublin, and a design for wall decoration, by Miss Booth, also of Dublin. A silver medal falls to Miss Ruth Nicholson, Dublin, for a design for muslin, which is highly creditable, and evidently designed *con amore*. Glasgow shows a design for a tile floor, which is better fitted for wall decoration. T. Mountford, age fourteen, has a promising design for a Kidderminster carpet. The gold medal is taken by G. Clanson, age sixteen, design for tapestry, hearth rug, carpets, &c. A bronze medal, for muslins, is given to W. H. Arnold. Edinburgh sends three "surface designs." A. H. R. Bartram, age thirteen, Cirencester, has a clever design for encaustic tiles, plates, &c. The national gold medal is worthily awarded to Miss Frances Brett, age twenty, Dublin, for wall decoration. Dublin comes out well in this class. Miss Maria Brooks, South Kensington, carries off another gold medal; and N. G. Broadhead, Nottingham, lace design, receives the third. This last is neither very elegant nor very new. Vases, filled with flowers, are not suitable for lace design, and we cannot conceive on what grounds this award has been made. W. Johnson, Glasgow, age nineteen, bronze medal for wall decoration—a very good design. Two bronze medals have fallen to Kidderminster. A. W. Poole, age sixteen, receives books, as does Francis Spring, Dublin, age nineteen, for design for furniture poplin. Marcella Irwin, Dublin, takes a silver medal for a design for a carpet or table cloth, and Charles Smith, Kidderminster, one for a design for a rug. The arrangement of this stage, 23c, is no arrangement at all. Designs for tiles, carpets, lace, wall decoration, and watch cases from Coventry are mixed together in an extraordinary manner. For watch-case design W. Scott takes a silver medal; T. N. Storer, a bronze medal, for designs for card backs; and F. Jones, Worcester, for plates. Birmingham sends next to nothing. A few indifferent designs for buckles, and a very bad one for a vase, are about all. This vase is emblematical of "Sport," Cupid on one handle, Psyche on the other, with "the Herald of Sport in the midst. On the body of the vase Ariel nymphs are enjoying their juvenile festivities. At the base are seated figures, representing boating, fun, and the battledoor!" (*sic.*) We will not give the name of the author. He is most probably a wag, but his master ought to have seen the joke. Sheffield sends little, and had better not have sent even that. Manchester is in this class represented by *one* design, a couple of fancy daggers. E. Slocomb, age seventeen, South Kensington, receives the bronze medal for a very good design for locks and hinges. This brings us to the end of the "applied art." In stage 14, painting direct from nature, Manchester actually gets two silver medals. Miss Manley, pupil teacher, previously medalled in this class, exhibits the best example. This class does not present any features of especial interest. It shows that drawing and colouring are taught, but when the drawings are done they are of no use. In stage 15, groups as compositions of colour, E. M. Bancroft, Manchester, takes the gold medal; Miss Malcolm the silver medal. Miss Jane Ogden, Manchester, exhibits a duck and curlew. Manchester seems to study those things which are of least consequence, while in applied art and design she gives little evidence of possessing local schools of art. The bronze medals have been distributed in such a way as to satisfy national pride. Dublin, Edinburgh, and Gloucester each get one. In drawings of the human figure, stage 8, the gold medal is given to C. O. Murray, Edinburgh; the silver medals to W. W. Oliver, South Kensington, age seventeen; to H. W. Foster, Nottingham; and the bronze medal to Miss R. M. Bowser, South Kensington.

A visit to this collection will furnish food for reflection. The question which naturally arises is this, why do those towns of whom most would be expected contribute the fewest and perhaps the worst examples? Birmingham, Manchester, Sheffield, Leeds, Edinburgh, and Glasgow are literally nowhere. Dublin takes, in our opinion, the first place. For this there must be some good reason, and the report of the Science and Art Department in the forthcoming Bluebook will doubtless give it. On the whole, the national prizes seem to us to be distributed with a too lavish hand, and the assurance of some of the masters in advising the exhibition of many drawings on the walls of the competition-room exposes them to private exhortation, if not public rebuke. There are limits which even emulation should not overstep.

THE TRANSACTIONS OF THE ROYAL INSTITUTE OF ARCHITECTS.

THE "peculiarities of domestic architecture in America" in comparison with those of England are stated in the paper by Mr. Gervase Wheeler to result from the fact that American life is "social on a much larger scale" and "far more comprehensive in its domestic machinery than English; the consequence, practically, being that the houses are all very much larger, the rooms of great size, and the appliances and arrangements to save labour to servants are most important features in the plan." It is, however, to the "local influences of climate"—which are added by him as the last and least on this list—that we think the principal differences observable are due; and we believe it will be found that the architectural lessons we can learn from the practice of our transatlantic cousins will prove far from numerous. What Mr. Wheeler describes as the most marked features of an American town residence, viz., the large cornices containing the gutters in place of parapets, would be neither necessary nor admissible here, and the width of frontage to houses usual in their cities would be precluded by the greater value of our land, as also would be their extreme depth; as, in a climate like ours, it would be impossible to content ourselves (as they seem to do) with borrowed light to the rooms in the centre of the blocks. The greater prominence of their entrance doorways it might be desirable to adopt, but this could be done at first hand—as it has often occurred to us it should—from those of Paris and other continental cities. Then as regards the country houses, their special features seem to be exclusively due to the requirements of the climate, and their "ample provision of verandahs, colonnades, and other shade-affording external features" would be quite *de trop* in England. Nevertheless, the fully-illustrated paper by Mr. Wheeler will be found to contain much information of value and interest, particularly with regard to practical details, as, for instance, the method of warming their houses, to which the Americans have devoted a great amount of attention. The notes on "The Exploration of Jerusalem and the Holy Land," by Mr. Grove, the honorary secretary to the Palestine Exploration Fund, though unfortunately rather barren of result—as is the composition of the heaps of *debris* through which Lieutenant Warren is, with the most commendable patience, driving his dusty way—are a record of British perseverance for the sake of "an idea" not less remarkable than the expedition to free the captives in Abyssinia. The most interesting discovery yet made, as remarked by Mr. Fergusson in the discussion which ensued, is the wonderful development of the terrace walls of the Temple, which are found to be no less than about 190ft. high, of wrought masonry, one half of which is now hidden by accumulations of rubbish. The paper by Mr. T. Roger Smith, on "Buildings for European occupation in Tropical Climates, especially India," is an able summary of the difficulties to be apprehended and requirements to be fulfilled by architects in such works, founded upon the experience of the author. Light and heat (which here we court) are the enemies to be encountered. Native prejudices have to be consulted, and destructive agencies, with which we are unacquainted, have to be guarded against. Then the appliances for the erection of buildings and the methods of carrying out works are so essentially different from our own that the information here recorded will prove valuable for reference to such members of the profession who may have to design buildings for tropical climates. Mr. M. Digby Wyatt contributes a valuable historical paper on "The Foreign Artists employed in England during the sixteenth century, and their influence on British Art." He has treated the subject, according to his wont, in a learned and exhaustive manner, and illustrated it with seven lithographs drawn on the stone by himself. It is impossible for us to take the interest which Mr. Wyatt does in this art of the era of the Renaissance. It is, however, fortunate that its attractions to some are so great as to induce them to give that research to its history which every past phase of art deserves,—and a phase which can boast among its masters of names like those of Torrigiano and Holbein must ever command respect. Whether or not these artists were in any degree answerable for the setting aside the purer, truly English, and far better Gothic art, or whether, as Mr. Wyatt urges, they merely replaced it after it had perished from inherent decay, it is impossible to be blinded to its comparative defects in all the higher qualities and aims of art by any technical superiority. Exquisitely as the recumbent figure of Dr. John Young in the Rolls Chapel may be sculptured, nothing can be more ridiculous than the design of the monument; and the Cupids on the tomb of Henry the Seventh are as absurd in their attitudes as Nonsuch Palace (of which an illustration is given) is in its architecture. The series

of papers is closed with a practical one by Mr. Charles Barry, in which he explains the use of terra cotta on a large scale as a building material, founded upon his own experience at the College of God's Gift, at Dulwich. By the energy of Mr. Blashfield and other makers the difficulty arising from shrinkage during burning seems to have been to a great extent overcome, and its colour being now under command, the imperishable nature of the material and its moderate cost must, we imagine, bring it rapidly into general use. Two very well executed lithographs of the details of this building, by Mr. Kell, accompany this description of Dulwich College; we could wish that the design, as a whole, gave us equal pleasure.

In the report of the Council to the annual meeting a table is given which shows the increase in the number of the members to be in greater proportion every year. Its funds improving sufficiently, the Institute is now able to afford the additional cost which was entailed by the recent appointment of Mr. C. Eastlake as assistant secretary, with a librarian as well. Through the liberal contribution of £500 by the President towards the purchase of books, and under the management of Mr. Kershaw, the library of the Institute may now be considered as taking its proper rank as the best collection of architectural works, and as such will no doubt prove an inestimable boon to the profession.

An alteration of the bye-laws during the session has increased the general term of office of the members of the Council to three instead of only two years; the latter period having been found practically too short, since it naturally takes some time for members to become well acquainted with their duties.

The committee for the "Conservation of Ancient Monuments and Remains" and the Professional Practice Committee provide a valuable machinery for watching over the interests of the profession—the former, by interfering when necessary to prevent the demolition or injudicious restoration of those ancient precedents which it values so highly, while the latter takes notice of the relation of architects among themselves and with the public, and has already done good service by establishing fixed rates of professional charges, and may yet do more by defining some of the other questions which daily arise, not only between architects and their employers, but also with those who are employed under them to carry out their designs, a subject, we believe, now under their consideration.

WOODS USED IN CABINET-MAKING.

WE have noticed in another part of to-day's impression the little volume "Modern Industries," published by the Paris Excursion Committee. The following is taken from the report on "Cabinet-making and the Woods Employed in it," by C. F. Hooper. After noticing the cabinet work of the Exhibition, the author says:—I shall notice the kinds of wood which from experience I consider to be, in appearance and wear, most suitable. For furniture for the hall, dining-room, library, and bedrooms, my first preference would be most decidedly for mahogany. Of this wood several kinds are in use. The best—close, fine grained, rich in colour, and of good figure—is the St. Domingo; Cuban, being straight-grained and clean, is used for mouldings; plain Honduras is used for inside work, carcases, drawers, &c., and for veneering on, but a rich figured veneer, called "feathers" and "curls," seen in cheap, strong furniture, is often produced from it. The best furniture should be made of Spanish mahogany, of which the richest kinds are cut into veneers. A good piece of work in cabinet-making, when well-seasoned wood has been given to the workman and the veneer is properly laid, is equal to solid work. The richest wood is much fitter for use in veneering than in the solid, but it should always be laid on a good dry and sound foundation of Honduras; if used in the solid it will not stand in wear like the plain, which is straight in grain, but will twist and crack; while in veneers, laid on mild straight-grained wood (such as Honduras) it will, the longer it remains in use, if kept in good condition, increase in beauty and richness. Dining-room and library furniture is often made of solid oak. This is a bad wood for the purpose. It gets dark and dirty-looking in wear. It never has the rich beauty of mahogany; it is, when not well seasoned, nearly certain to twist, crack, and fly, and even when it is well seasoned, no dependence can be placed on it. In my opinion, good pine, stained, grained, and polished to resemble oak, is as good for use as the genuine article. Let oak be kept for building purposes and for fittings in churches, chapels, and large halls, where strength rather than beauty is desired, and where it is fixed, not portable. For bedroom and boudoir furniture mahogany veneered with satin or walnut, or inlaid with coloured or stained wood, is the best. Walnut is rich in figure, but it will not stand well in wear; the grain cracks, shrinks, and opens after it has been some time in use. It is very porous. I have known furniture in this wood to be beautifully finished, the grain so close and fine, the polish so perfectly smooth—in appearance like glass, so that a spot or defect of any kind could not be discovered—but after three months' wear it has become full of cracks, small holes appeared all over the surface, and there has been that continual sweating (inherent in the wood) which causes so much complaint between customer, employer, and workman. Satin-wood is being introduced in preference to walnut. It will certainly wear better, but it runs very narrow when cut into veneer, there is great waste (on account of the sap) in the manipulation, and it requires good jointing and matching of the grain so as to deceive the eye. Of late years great improvement has been made in staining, graining, and polishing pine for cabinet work. For bedroom furniture more particularly it is capable of being used with advantage; it is at once portable, inexpensive, and when good dry material is well stained and polished, equally as serviceable as more costly woods. But it requires to be used with care; on account of its softness it will show every mark, scratch, or bruise, and it needs to be kept well dusted and perfectly clean. There is an advantage in its use, which does not apply to the old style of painted deal—that it must be sound or the faults will soon expose themselves, whereas in the case of painted furniture "shakes" can be filled in and stopped, and covered with size and paint. In drawing-rooms walnut has been in the fashion, but will be superseded, I think, by ebony and gold—a mode of decoration than which nothing can look richer. Here, marqueterie, with light, elegant turning and rich carvings can always be introduced at pleasure. Good carved work overlaid with gold shows to great advantage, and can at any time be restored and made equal in appearance to new work. Ottomans, couches, chairs, &c., covered in blue, crimson, amber, or green, invariably look richer when the woodwork is wholly or partially gilt over. In gilding, the use of solid ebony, which is brittle and expensive, can be avoided, and a close grained wood of another kind, stained in resemblance of ebony, when the grain is well filled in and properly polished, may be substituted so as to stand well in wear. Drawing room cabinets, if of ebony alone and richly carved as in France, display gold decoration in effective contrast. Loo, card, and occasional tables should be of marqueterie, as also the smaller fancy tables, which can be varied in design. Tripods for plants and flowers look rich in ebony and gold, and stands for supporting vases should be either of ebony or gilt. These contrast well with silk, tapestry, and lace, and with the white marble which is so necessary in drawing room decoration. I have not here noticed other woods, as maple, birch, and ash, which are used sometimes in cabinet work. I might here notice rosewood as being a good material, but it has given place in actual use to walnut; it is rich in appearance and wear, but very heavy; it is at present little in use, and scarce, although I believe that it is preferable to either walnut or oak.

Having given my opinion from experience of the woods most suitable for cabinet work, and shown where they can be employed to the best advantage both for appearance and for wear, I may now turn to what especially concerns the workman and his labour. The workman is often obliged to use wood that is unseasoned, shaky, and faulty, owing in some cases to the ignorance or the wilfulness of a foreman or employer who pretends to practical experience: in some cases to the desire for cheapness, the idea being that the workman can make the best of his materials or at all events bear the blame if he does not. A workman shall exert his utmost skill in preparing and finishing an article in cabinet work—he shall put and fix everything thoroughly well, with close, fine joints, dovetails, and tenons, made as though the completed work had grown; and yet, after a few months' wear, loud reports from the furniture are heard—reports that might originally have suggested the invention of "spirit-rapping"—caused by the shrinking and splitting of the wood, the sundering of the joints, and the general description of the work. Alas! for the workman, upon whom inevitably falls the blame. Customers quarrel with employers, and employers in their turn quarrel with the journeymen, who must quietly submit to the injustice or go about their business; or if work has been done "by the piece" the man must put it all right again at his own cost in labour if not in material. There is, I am sorry to say, a system prevalent in London among many who call themselves "house furnishers" of making furniture, especially if it be for the country, of bad, unsound material and labour so indifferently paid, that a large profit can be realised. London being the great centre of trade and commerce, country people foolishly go to the trouble and expense of sending to the metropolis for goods of this sort, vainly imagining they can be better supplied there than by manufacturers in their own towns, where at least they know with whom they deal. This, I think, will be found to be not the practice in France. There, as is well known, men may be found who —such is their love for art—work for glory alone, and whose aspirations soar higher than the mere acquisition of wealth. The workman, too, is encouraged by honours and rewards from the Government to exert his labour and skill in the production of works that shall promote the advancement of the nation. In no country in the world, I am bold to say, is there less respect paid to labour alone than in my own; and what progress have we made since 1851 as compared with our neighbours across the Channel? In the cabinet trade, as a whole, there is no improvement, no design, no carved work, which may be put in comparison with the display of the manufacturers and workmen of France; nor shall we ever progress so long as it is felt to be a degradation to own one's self a mechanic.

The process of polishing should have some notice in a report upon wood. The niceness of the grain, displayed to so much advantage in screens, where "feathers" and "curls" of every design are produced, would not exhibit half its beauty were it not for the labour and skill of the polisher. But here there is too often the fault of hurry, and what we call "scamping" the work. Polishing, to stand in wear, should never be hurried. Without entering into the secrets of the trade, I may add that it ought to be repeated at certain intervals, so that the grain may be well filled in before it be finished off, or it will soon expose its deficiency in wear. A piece of good work well polished will always show to the best advantage, and will increase in beauty and richness by use if properly attended to. Where there is carving, and the fingers of the polisher cannot apply the rubber, a thin coat of varnish can be applied with a brush, so as to put a gloss on it, as it protects the work from dirt and dust which would otherwise so eat into the fine and delicate parts that it could not be removed. Much must in this case depend on the knowledge and skill of the polisher.

KEIGHLEY, YORKSHIRE.

MECHANICS' INSTITUTE AND SCHOOL OF ART.

THE erection of a large building, for the joint accommodation of the Mechanics' Institute and School of Art, has just been commenced at Keighley.

On the ground or principal floor the Institute will have its more important rooms, consisting of reading-room (at the south-west angle of the building), 38ft. by 20ft.; conversation-room, 28ft. by 18ft.; library, 33ft. by 18ft.; also patents-room, pence bank, and secretary's office. The lecture-hall, a large and handsome apartment, 87ft. by 44ft., and with a waggon-headed and panelled and boarded ceiling, will be common both to the Institute and School of Art, and will seat about 700 people.

On the upper floor the School of Art will be located, and will have an exhibition-room, 46ft. by 22ft.; mechanical-room, 28ft. by 18ft.; painting-room, 30ft. by 18ft.; modelling-room, 33ft. by 20ft.;

casting-room, master's room, and retiring-rooms and lavatories for each sex. The lighting of the painting-room will be to the north, and of the exhibition-room from the top. From the landing of the principal staircase leading up to the flat or story, a gallery opens out into the lecture-hall before mentioned, giving accommodation for about 100 persons.

The whole of the basement story, which, from the nature of the site will be clear of the ground on all sides, is occupied by a range of class-rooms, ten in number, some of them of very large size, also by a tea-room, 50ft. by 18ft., and a residence for the hall-keeper. Separate entrances to this story are provided in the plan.

The building is so arranged that the Mechanics' Institute, the School of Art, and the lecture-hall may be in operation at the same time, and yet not interfere with each other. All the rooms are lofty and well ventilated, and will be warmed by open fires or by hot water apparatus.

Externally the building will form a handsome Gothic structure, built entirely of stone, and with ashlar quoins and dressings. It is situated at the angle formed by Cavendish street and the Skipton-road, and will be a conspicuous addition to the public buildings of the town. The principal entrance will be under a lofty tower (rising to the height of nearly 100ft.), and serving to unite and yet to distinguish the double block of the buildings. The contracts for the erection have been chiefly taken by Keighley contractors, and the estimated cost, with the land, is about £12,000. The architects are Messrs. Lockwood and Mawson, of Bradford and London.

BATHS AND WASHHOUSES, KEIGHLEY.

The erection of baths and washhouses for the township of Keighley has just been commenced by the Board of Health. The accommodation provided will consist of a central office, with separate entrances and waiting-rooms on either side of the baths; two men's tepid swimming baths (first and second class), each 60ft. by 30ft., with open framed timber roofs and top lights; four first and nine second class men's slipper baths. On the upper floor, and approached from either entrance (so as to be used by either sex on different days), will be a suite of Turkish baths, with a first and second class tepidarium and frigidarium and calidarium complete to each.

The washhouse will consist of thirty double washtubs, each supplied with steam and hot and cold water, and with drying closet, and all requisite appliances to correspond, on the most approved principle. An engine and chimney (the latter 90ft. high), and a suitable residence for the attendant in charge, will complete the arrangements.

The building is Gothic in design, and the large inside baths will be treated to correspond. The contractors are wholly Keighley men, and the designs are by Messrs. Lockwood and Mawson, architects, of London and Bradford. The cost, exclusive of the ground, will be about £7,000.

A NEW BLASTING POWDER.

SOME curious experiments have been made at the Merstham Grey Lime Stone-works, near Redhill, with dynamite, a new blasting powder, the inventor of which is Mr. A. Nobel, a Swedish gentleman. Dynamite, which resembles coarse dark-brown sand, is a solid granular explosive, for which is claimed force of a remarkable degree, and a harmlessness under ordinary circumstances that cannot fail, if fully confirmed, to make it one of the most popular and desirable of explosive agents. The causes which render gunpowder and nitro-glycerine so dangerous to handle, or convey by the common modes of transit, have no effect upon it. Nitro-glycerine explodes at 240 deg. Fah., gun-cotton at 400 deg., gunpowder at 600 deg., a common fire at 1,200 deg.; but a much higher temperature than this is required to ignite dynamite, which must be placed somewhere between 1,400 deg. and 3,280 deg. A thin deal box containing 10lb. of the compound was placed over a raging fire; the box was consumed, but there was no explosion, and the dynamite mingled harmlessly with the ashes. It was in other ways placed in immediate contact with fire, with the same results. Gunpowder was exploded near it without effect. The superiority of the material over the dangerous explosives as to which concussion would be certain destruction was acknowledged by several practical persons present connected with the carrying trades. Ten pounds of dynamite were enclosed in a second deal box, and hurled from the top of a cliff. It fell 60ft. upon the rocks below, with no more signs of explosion than would be caused by the fall of a brickbat. Equally striking were the illustrations given of its deadly strength. A cartridge filled with dynamite was placed upon a 2-inch oak plank. A fuse with a strong percussion cap was attached to it and fired, and the plank was split in several places, and had a hole knocked through it. The percussion cap is the explosive agent, and it is claimed that nothing else, so far as is known, will do the work. In this instance the work was done most effectually, although the cartridge, which was about the size of a man's finger, was laid loosely on the plank. A large block of granite, about a yard cube, was shivered by like treatment. A block of wrought iron with an inch bore hole, but without either plug or tamping, shared the same fate, as did a wrought-iron cylinder with a charge laid loose on the top. The rocks were bored 15ft. deep, and fired, with an effect that startled the quarrymen present, not because of the loudness of the report so much as because of the immediate and extensive character of the blasting. Other experiments demonstrated the great velocity imparted to fragments of shells charged with dynamite, and its adaptability to distress signals. At the close, Sir Charles Fox, and several gentlemen connected with mining, railway, and other kindred interests expressed their surprise at and admiration of what they had seen, one speaker saying that if the material were in use much saving of life would be the result, and another expressing his belief that railway companies might carry it without any risk. Sir Charles Fox thought it would act admirably in borings under water. Entire confidence was expressed as to the future of the invention, and Mr. Nobel experienced a reception that amounted to an ovation when he briefly thanked the spectators for the disinterested kindness they had shown him. The merits of dynamite are already engaging the attention of foreign governments.

THE ORIGIN OF THE POINTED ARCH.

A CORRESPONDENT of the *Athenæum* says:—In Mr. Garbett's "Treatise on the Principles of Design in Architecture" is the following passage:—"Vaulting being the all pervading motive, the final cause of Gothic architecture, that to which all its members subserve." And, in a note,—"This was first shown, we believe, by Ware, in his admirable 'Tract on Vaults.'" This view was in reality first suggested by Barry, the painter. We quote the following passage from Vol. I. of his works, p. 130 (1809):—"The absolute origin and cause why the Pointed arch came to be introduced was the confounding the circular and square forms together, and the ill-understanding of some few examples of the ancients, when the necessity of things constrained them to use those forms together. Besides the examples cited from the Amphitheatre of Titus there is to be seen in Adrian's Villa, at Tivoli, a number of chambers which are square, and as there was a necessity for covering them with a vaulted roof, the four sides met in a common point in the centre of the ceiling, by which means each side of the ceiling gives exactly the same form of the Gothic arch, although they are, in reality, made up of half circles crossing one another.' Barry's letter to Edmund Burke, in which this passage occurs, was written about 1768, and Ware's "Tract on Vaults" was published in 1822.

FIREPROOF FLOORING.

EXPERIMENTS have lately been made in New York to test the merit of floors supported by wooden beams, and prepared with the intention of rendering them impervious to fire. A floor was constructed in the following manner:—Strips of pine, half an inch wide by half an inch thick, were nailed along the centre of the upright floor beams throughout their length. Thin sheets of iron were then nailed upon them the strips keeping the sheet-iron a distance of half an inch from the beams. Plaster of Paris, to the depth of 1¼in., was poured on the sheet-iron, and the sides and top of the beam smeared with it, and when conveniently plastic rounded to some 2in. up the sides. After the plaster had become set the floorboards were fixed. Provision was made against fire from the upper as well as the lower side by fastening thin sheets of iron on the tops of the beams, and spreading a layer of plaster of Paris ¼in. thick over the sheet-iron before laying the wooden flooring. It is said that a fire beneath the flooring, which was raised about 3ft. from the ground, was lighted and kept up for three hours, at the end of which time the flooring was comparatively uninjured. The only portion which the fire affected was the sheets of iron where they were joined. These were found to be slightly sprung. A hot fire was then lighted on the top of the platform, and allowed to burn three hours. This test was also perfectly satisfactory. The cost of this fireproof floor per 100ft. by 25ft., less walls, would be 675 dollars.

LUXURY AND SQUALOR IN A PALACE.

"THIS but one step from the sublime to the ridiculous;" and, according to the *Lancet* Sanitary Commission, there is hardly so great a distance intervening between that luxuriously-appointed though seldom used, home of royalty, Buckingham Palace, and the wretched and squalid, though constantly used, quarters in which the Queen's body-guard and a company of Grenadiers are located. The soldiers quarters are at the southern extremity of the Palace. Here three huge columns support a massive plinth, and behind these are two doors, more like entrances to a Grecian temple than to the two wretched apartments in which the troops are located. In the guard-room the men sleep and take their meals, the cooking being done in a kitchen 11ft. by 12ft., of which space the stove occupies a large proportion. The guard-room is lighted by two large windows on the western side, and thorough ventilation is secured. The guard-room is, however, a palace compared with the barrack-room above, which is 70ft. long, without windows at the sides or ends. The low, flat ceiling is broken by two small cupolas, with a lantern opening on the top of each. In this apartment are beds for 37 men. In one corner of the small yard are dirty-looking latrines and lavatories out of repair; while hard by is a stinking dustbin, foul with refuse, stale vegetables, and spoilt food. The Commission has met with no accommodation so infamous as this. "The comforts of the men have been altogether sacrificed to outside architectural effect. Windows are not consistent with Classic columns and stately temples; the soldiers must, therefore, be made to go without."

ART EDUCATION.

LAST week we called attention to the report of the committee which had been appointed in February last to inquire into and to suggest the best methods for promoting technical education in this country, and we give the results contained in resolutions which the committee adopted. The committee, however, reserved for separate consideration the education of those who are producers of works of fine or decorative art, or directors of art manufactures. It is necessary to bear in mind, says the report, that for the production of works of an æsthetic character, scientific principles occupy a subordinate position, while a knowledge of the details of execution is desirable for those who design or guide the work of others. Moreover, it must be borne in mind that the taste of those to whom works of beauty appeal is far more fluctuating than the demand for productions in which utility is alone considered.

The committee are of opinion that one of the first conditions of progress is, the cultivation of artistic knowledge and taste in all classes of society. With this object in view, no less than with a view to the technical education of the art-workman, provision should be made for the teaching of drawing in all schools, primary and secondary, as a branch of general education, in order to train the eye and hand, and in order to cultivate habits of observation. It is essential that drawing should be part of the regular school course and not an extra lesson; and, further, that it should be taught intelligently, not from mere copies, but from real objects. The art-workman needs, in addition to a power of free-hand drawing, an acquaintance with geometrical drawing, in order that he may be able to execute work correctly, in accordance with the designs of the artist who directs him.

The committee are of opinion that the Universities may render great service to the technical education of those engaged in artistic pursuits by the recognition of art as an element in general education, and by professorial lectures. Some steps in this direction have been taken, by the

regulations attaching importance to drawing in the local examinations; but the committee would gladly see the practice carried further, and applied to the higher stages of academical education. They do not doubt that the study of works of ancient and modern art would have a tendency, in connection with literature, to diffuse culture throughout the nation, and to raise the standard of technical education.

CHURCH OF THE ENGLISH MARTYRS, PRESTON.

THE accompanying illustration represents the south-east view of the above-named church. The building is about 140ft. long by 70ft. in width, and the same in height. It is externally entirely built of Longridge stone, and, independently of the tower, which is not yet commenced, has been erected at the remarkably small cost of £4,000, exclusive of altars and fittings. The church has been built for the Rev. J. Taylor, of Moor Park, from the designs of Mr. Welby Pugin, of 1, Oxford-street, Liverpool.

A COURSE OF STUDY FOR ARCHITECTS.

THE committee appointed by a meeting called together at the Society of Arts to consider the best method of promoting technical education selected Mr. John Scott Russell to draw up a course of study for mechanical engineers and architects. We will not dispute Mr. Russell's ability to map out a programme of study for mechanical engineers, but we altogether question his ability to do a similar thing for architects. The following is the three years' course, as recommended by Mr. Russell :—

FIRST YEAR.—Mathematics, physics, chemistry, descriptive geometry, strength of material, statical construction, principles of style and design, surveying and measurement.

SECOND YEAR.—Physics, natural history, physiology of health, psychology, constructive geography, principles of carpentry, metal, stone work, mechanism of buildings, principles of beauty in buildings, history of architecture.

THIRD YEAR.—Mathematics of curve lines and surfaces, light and shade, perspective, history of building materials, health of buildings, domestic economy of buildings, principles of proportion and decoration, practical design.

The names of Mr. J. P. Seddon and Mr. R. Phené Spiers having been added to the committee after the special course above suggested was drawn up, these gentlemen recommended that the following should form a part of the course of education for architects :—The study and delineation of ancient monuments, the visiting and examining buildings in progress, the study of ornament and of the human figure, modelling, perspective, decorative colouring, landscape painting.

CARVED STONE PANEL.

AS long as carving is entered into bills of quantities, jumped at by builders, and sub-contracted for at a grinding price, it must remain poor and spiritless. How can we expect it to advance in quality as long as we value it together with bricks and mortar? Happily there are some few professional men who retain their own sculptors, whom they have educated to make manifest their ideas without having to supply them with elaborate drawings, which are a very important item to the architect. It is very common and very aggravating to have to pay a fancy price for the poor work of inferior artists; this is no less the case with many architectural carvers.

An experienced hand can mentally see his work done before his chisel touches the stone—of course where a considerable subject has to be treated a pilot model is indispensable; he will boast out his light and shade crisply and with confidence, making the foreseen effect at an early stage of his proceedings, and finally giving here and there a suggestion of the details, and no more, he will not forget the architectural duty of the subject in hand, and will leave proper material witness of its character. Let us look at our less fortunate friend for a moment; he does not know what it will look like when finished, but he has a vague notion of *fat* carving, so he manages to lump his work up, expecting the effect to come at every stroke; perhaps he will leave it in this state to show that there is a dash about him, or, if he is a painstaking person, he will finish it off with a nicely furrowed or granulated surface, with a bit of roughing or stamping at the back, much in the same manner as cheap, shoppy metal castings are got up just now.

Our continental neighbours are most enthusiastic in their publication of architectural details, and it is really wonderful how they make it pay, considering the elaborate manner in which the plates are executed. Such works are comparatively rare with us. General views and sketches are not uncommon, and for this reason, that architects have no objection to publish from their portfolios and sketches that which advertises them. But measured-up detail is quite another thing: this, along with bits of carving and quaint conceits, he trots out occasionally in his designs, and stands sponsor to. None know better than the profession that the publication of old examples, particularly of ornamental details, prevents their being used; the thing becomes patent, and it is not without good results—it obliges architects to design for themselves, or draw from an unpublished source. From accounts we have of the secrecy of their craft and the appearance of their works, there seems little doubt but that the "old fellows" did much the same thing; but with this difference, that they returned from their pilgrimages possessed of that which students nowadays do not bring home with them, viz., inspiration. After what I have said, I shall offer no apology for mingling old work with new, it being so usual in actual practice, and, if judiciously done, of more or less advantage to both. The three figures in the illustration are from old authorities; there is a very pleasing freshness about them, being unlike any one thing in nature, without being unnatural. They do not go in for the stark stare which mediæval animals are prone to, but rather for the expression of thought. In the latter part of the "Seven Lamps of Architecture" the author has illustrated and beautifully described this species of grotesque.

The panel, as illustrated in the lithographic drawing, is intended to be placed on a level with or a few feet above the eye, either by itself or in company with a series of similar panels and heraldic emblems or monograms to form a band or frieze, or the bottom portion may be removed and the remainder made a square panel. The whole of the subject is dished out of the flat, the foliage kept quiet, the leaves being depressed at their origin and rounded softly at their extremities, the flowers gently cupped, avoiding littlenesses. The figures must retain portions of the original flat surface, particularly on their shoulders, back, and sides, and be kept subordinate to the central composition.

I might add that the foliage is not from any particular plant or flower, for experience teaches one that conventionalising any leaf or flower not only cramps the imagination and makes designing arduous, but it courts the criticism of the fastidious; and further I have reason to believe that the names of carved or otherwise idealised plants are given to them after their execution on account of some accidental resemblance they may possess. —O. W. D.

THE NEW CHELSEA BARRACKS.

THE *Lancet* Sanitary Commission on the state of the barracks of the household troops has paid a visit to the newly erected barracks at Chelsea, which are constructed on the very latest model. The site is good, and the drainage excellent. The buildings cover thirteen acres, and are so distributed as to secure free passages for air between them. The main building is upwards of a quarter of a mile in length, and is devoted to the ordinary barrack-rooms. The basement is open from end to end, and was intended for a shooting gallery, but the architect, evidently no rifleman, did not allow sufficient height for the trajectory, thus rendering it impossible to shoot from one end of the gallery to the other. An attempt was made to remedy the evil by placing the men in a pit; but rifle practice has now been discontinued. Each block of six barrack rooms is approached by a common staircase; each room accommodates twenty-five men. In size and construction there is nothing to desire. Cold and excessive ventilation were complained of in the winter, but an extra blanket supplied to the men obviated the inconvenience. The lavatories and night urinals are placed in small apartments on each landing. These are dark and imperfectly ventilated; there is no intermediate corridor, and the foul air enters the passages and barrack-rooms. The windows are narrow, and do not reach the ceiling. In every instance the floor was wet, generally from leakage. The urinals, if not locked up in the day time, would be perpetually out of order. Out of the 27 used by the Fusiliers 13 required repairing at the last quarterly inspection. If a urinal on the ground floor be out of order it becomes necessary to shut up all those above it. No latrines or sinks are provided for the wives and families of the pay sergeants, who have, therefore, to cross the parade ground (in some instances probably not less than a third of a mile). The commissioners recommend that these people should be provided with earth-closets. The baths are good, clean, and abundantly supplied with *cold* water. They are, consequently, never used in winter. Throughout the barracks the surface is artificial, and there is a general settlement of superficial paving which destroys the incline of watercourses, &c. This needs to be once for all revised. The prison is altogether badly ventilated. There is an excellent cupola roof, which, if capable of opening at the top, would effect everything required. The air of the cells is excessively offensive, and the windows do not open. The shoemakers' shop belonging to the Fusiliers is overcrowded and badly ventilated. The wash-house and laundry are well fitted, although the number of coppers is insufficient. The married quarters are the best the commissioners have seen. There is a sink and water-tap on each staircase. The rooms are all of the same size, and a few of them were hot and overcrowded. The gymnasium, fives court, chapel, libraries, kitchens, and dining halls are beyond praise. The supply of water is 57·7 gallons per head per day, much of which large quantity probably runs to waste. There is no hospital accommodation. The commissioners, in concluding their report, state that they were forcibly impressed with the substantial construction of the building, and what appeared to them an unnecessary waste of brickwork. Fourteen-inch walls are made to carry stone staircases, the number of which is incredible. There are huge hollow shafts of brickwork closed both at top and bottom, and acres of heavy white-washed passage walls in all the married quarters. These add nothing whatever to the efficiency of the building, whilst they have enormously increased its cost.

ARCHÆOLOGY.

THE British Archæological Association has chosen Cirencester as the place for holding its annual meeting. The session will commence on Monday, August 10, and last the entire week.

On Tuesday the annual general meeting of the members and friends of the Essex Archæological society was held at Brentwood. After the transaction of the ordinary business a paper was read by Colonel Joseph Samuel Chester on "Essex Families and Nomenclature in New England." This was followed by a paper by Mr. H. W. King, on "An Inedited Letter written in the Tower by Miles Corbet, on the night before his execution, and long preserved by his descendants at Shenfield," the adjacent parish to Brentwood; and also a paper on "Inventories and Assignments at South Weald and Brentwood in the time of Edward VI." After some conversation on topics arising out of these papers, the meeting proceeded to visit Herdern (specially interesting for its chantries and sepulchral monuments of the Tyrells of Heron), Little Warley, and other places of antiquarian interest, where papers were read. The meeting then returned to Brentwood, where a dinner at the "White Hart Inn" brought the day's proceedings to a close.

The annual excursion of the Surrey Archæological Society took place on Thursday week, when about one hundred and fifty ladies and gentlemen proceeded from Dorking in carriages and breaks. The first point made was Milton Court, a seventeenth century Surrey mansion. Wotton Church, said to be a specimen of Saxon work, was then visited, and its principal features were explained by the rector. Anstiebury Camp, by some said to be a memento of the Roman occupation, and by others affirmed to be a relic of the Druids, was next visited. Returning to Dorking, the visitors viewed the recently restored chancel of St. Martin's Church, and thence proceeded to inspect a collection of antique and modern furniture at Pipbrook House. Fifteen gentlemen were afterwards elected members of the society.

WATER SUPPLY AND SANITARY MATTERS.

BAD drainage and scanty water supply, aided by the hot weather, are again doing their work at Sydenham. Fever of an aggravated character has attacked the town, proving fatal in a large number of cases. Many of the older houses have no water supply at all, and trust to foul-conditioned wells and pumps. Great alarm is felt in the neighbourhood, and prompt public action is desirable.

The defective water arrangements at Saltburn-by-the-Sea are about to be remedied by drawing the supply from the Leckwoode and Swindale springs, 6½ miles distant. A company, with some £10,000 capital has been formed for the purpose, and tenders for the same have been let.

New waterworks are forthwith to be commenced at Rhyl.

Owing to the drought, the Stubden reservoir, near Denholme (from which the inhabitants of Bradford and the vicinity are supplied with water) has been exhausted.

On Monday the commission for inquiring into the pollution of rivers visited Stockport in the prosecution of their inquiries respecting the Mersey and its tributaries. They were accompanied in their inspection by the Mayor and other members of the Corporation. Samples of the water were taken at various points for the purpose of testing.

Out of 5,068 houses in Hackney visited by sanitary officers during 1867, no less than 1,000 had the top window sashes so fastened that they could not be opened for purposes of ventilation.

New drainage works have just been completed at Hastings. The old drains, which used to empty themselves at different points in front of the esplanade, to the great annoyance of bathers and of the inhabitants generally, have been intercepted by a main sewer, which, with a fall of 5ft. 6in. per mile, takes all discharge eastward to a tank capable of holding 1,500,000 gallons. In this tank the sewage is stored until low water, and then discharged through about half a mile of 4ft. iron culvert, with a fall of 10ft. per mile, into the sea. Over the tank are air gratings, fitted with charcoal boxes for neutralising the escaping gases. The entire cost is upwards of £30,000. The works have been carried out by Mr. Howell, contractor, from the plans of Mr. Andrews, the local surveyor. Similar works have been carried out at St. Leonards, under the direction of Mr. Bazalgette.

Building Intelligence.

CHURCHES AND CHAPELS.

The foundation stone of a new Wesleyan Chapel was laid at Normanton, near Wakefield, on Monday fortnight. The building will be of red bricks, with white brick arches and string-courses, with stone dressings. The inside dimensions of the chapel are 42ft. long by 33ft. wide, and it is capable of seating 200 persons. Mr. William Watson, of Wakefield, is the architect, and the contract has been taken for the whole of the works by Mr. Henry Gibson, of Normanton, builder.

The ancient little church at Frinton, Essex, the smallest, it is said, in England, which stands upon the cliffs only about 300 yards from the sea, was reopened on the 7th inst., having undergone considerable restoration and improvement. The south wall has been entirely rebuilt, a small window being added to it. The roof has been retiled, and the high unsightly pews and old benches have been replaced by a number of neat varnished benches, space being economised thereby, accommodation for from twenty to thirty additional persons being now provided. The total cost has been about £150, and Mr. Joseph Grimes, builder, of Colchester, has performed the work.

The church of St. Peter's, Hunslet Moor, was consecrated on Thursday fortnight. This is the second church built by the Leeds Church Extension Society, and has cost £5,400. On the same day the Bishop of Ripon laid the first stone of another church, built under the society's auspices, which is situated in Goodman-street, Hunslet-road. The society has also nearly completed a church at St. Clement's, Sheepscar.

A new church at Kelsall, near Chester, dedicated to St. Philip, was consecrated on Thursday, the 9th inst. The church, which has been built chiefly at the expense and through the exertions of Colonel Tomkinson and members of his family, is a small but very neat structure, fitted with open benches, accommodating 180 adults and 80 children, with chancel stalls. It consists of nave, 60ft. by 25ft., and chancel 28ft. by 18ft. There is an organ recess and sacristy on the north side of the chancel, and a bell gable constructed over the chancel arch. It is built entirely of local stone; roofs open and boarded. The building has cost about £1,800. The architect is Mr. Thomas Bower, jun., of Nantwich, and the work has been principally executed by local workmen.

A new church at Ivegill, Cumberland, was consecrated on Wednesday week. The style is Geometric, and the structure is built of stone from the Ivegill quarries, faced with Shawk stone. The church comprises nave and chancel, south porch, vestry at the north-east, and a bell spirelet surmounts the apex of the west end gable, pierced for three louvres. The east window depicts the Last Supper, and this window, together with those in the nave and at the west end (which are all of stained glass) was executed by Messrs. O'Connor, of Berners street.

The people of Banbury have just declined a munificent offer of £1,000 from the vicar's father, and £500 from a brewer of the town, towards rebuilding the chancel and improving the organ of the parish church.

The whole of the sum (£12,000) required for the building of the Cathedral of St. Finn Barr, Cork, has now been subscribed.

On Thursday week the foundation stone of a new Wesleyan Chapel was laid at Whickham, near Newcastle. The style is Gothic, and it will be built of local stone. The plans have been designed by Mr. J. E. S. Vardy, architect, of Newcastle.

On Monday week the foundation stone was laid of a new Wesleyan Chapel at Southwick, near Sunderland.

The church of St. Margaret, Whitnash, near Leamington, was reopened on Thursday week, after restoration. The whole of the south aisle has been rebuilt, giving nearly 100 additional sittings. A new porch has also been added. Mr. George Gilbert Scott was the architect, and Messrs. Ballard and Price, of Leamington, the builders.

Truro Cathedral has just been presented with fittings and stalls for the entire choir. The donors of these costly and elaborate carvings are the Misses Cooper, of Markree Castle, and they were brought from abroad by Mr. Cooper.

Broomfield Church, Chelmsford, is to be restored, at a cost of £2,000. Mr. Chancellor is the architect.

The church of St. Mary, Stottesdon, Shropshire, was re-opened on Tuesday week after undergoing restoration at the hands of Mr. Blashill, of Jewry Chambers, London, at a cost of upwards of £2,000.

A new Congregational Chapel is about to be erected at Bognor.

The foundation stone of a new church at Brighouse, Yorkshire, was laid on Saturday last. The cost will be between £4,000 and £5,000.

The Earl of Bradford, on Saturday week, laid the corner stone of the new church of St. Mark, Bolton. The building is to accommodate 900 persons, and will cost £5,000.

Hampnett Church, Gloucestershire, was lately reopened, after restoration by Mr. Street.

The foundation stone of St. Mary's Church, Strood, was laid on Wednesday week. The contractors are Messrs. Foord and Sons, and the edifice is to be completed in a twelvemonth.

The foundation stone of a new Wesleyan Chapel, at Goldenhill, near Runcorn, was laid on Tuesday week. The building will be erected from the designs of Mr. Roberts, of Trentham, the contractor being Mr. John Grosvener, of Bradley Green. The cost is expected to be about £2,200, including the price of the land.

The parish church of Broadwood-kelly, Devon, has been restored at a cost of £700. The tower has been partially rebuilt in strict accordance with the ancient character of the building. Messrs. Gould and Son, of Barnstaple, were the architects, and Messrs. Pulsford, of the same place, the builders.

The old church of St. Michael, Spurriergate, York, was re-opened on Sunday last, after restoration. The north wall has been rebuilt, and several stained glass windows inserted. The church has also been re-floored and re-pewed throughout. Messrs. J. B. and W. Atkinson, of York, were the architects.

A new Congregational Chapel was opened at Ross, Herefordshire, on Tuesday week. It is built of native stone, in the Middle Decorated style. It is 60ft. long, 37ft. 6in. wide, and 21ft. in height. Mr. B. Lawrence, of Newport, was the architect, and Mr. Durke, of Cinderford, the builder.

The foundation stone of a new chapel, at Lancing College, Sussex, was laid on Tuesday by the Bishop of Chichester.

On Wednesday week the foundation stone of Chipstable Church, Devon, was laid. The tower of the old edifice has been restored, and the portion which is now being rebuilt will comprise south aisle, chancel, and porch. Mr. Ferrey is the architect, and Mr. J. Davis, of Taunton, is the builder.

The new church at Llanfair is rapidly approaching completion. The edifice has been rebuilt, as far as possible, upon the old foundations, and consists of nave and chancel, north aisle, vestry, and south porch; and when the tower (the base of which alone is standing), is carried up and thrown up on to the church, accommodation will be provided, by open seats, for 427 persons. The rich transitional south doorway has been retained. The old font will be restored and provided with a cover, and the recumbent figure of St. Elidon will be replaced in the chancel. The chancel will be marked internally by a low stone screen, and will be provided with prayer-desk and stalls. The pulpit (of stone, inlaid with coloured marbles) stands on the south side. The space within the altar rail is paved with Maw's encaustic tiles, and the slab at the back of the altar table will be inlaid with majolica and other tiles. The windows (with the exception of that next the pulpit on the south side, which is filled with grisaille glass, by Heaton and Co., London), are glazed with thick green cathedral glass (the east window being in geometrical patterns), by Messrs. Done and Davis, of Shrewsbury. Local bluestone is used for the walling, with red Shelvoke for the dressings to windows, &c. The roofs are slated. The work has been carried out by Mr. R. Lloyd, builder, Welshpool, under the direction of the architect, Mr. E. Hycock, jun., of Shrewsbury, at a cost of £2,000, including warming apparatus.

The foundation stone of a new church was laid on Saturday at Brighouse, Yorkshire. The style will be Decorated Gothic, and it will be built at a cost of between £4,600 and £5,000, from designs prepared by Messrs. Mallinson and Barbe, of Halifax.

A new Wesleyan Chapel is about to be built at Ran Moor, Sheffield, from designs by Mr. John D. Webster, architect, Sheffield, which were selected in a limited competition. Accommodation is provided for upwards of 300 adults, in addition to a gallery for children.

BUILDINGS.

Mr. Honeyman, architect, Glasgow, has submitted to the Helensburgh town council plans for the re-erection of the town buildings.

The governors of Middlesex Hospital are about to erect a building in which to train nurses for the sick. The cost is calculated at £6,000.

The works in connection with the enlargement of the Leeds County Court premises, rendered necessary by the great increase of business, were commenced last week. The extension will be carried out from the designs of Mr. T. C. Sorby, architect, London. With respect to the court where the trials take place there will be no alteration. There will, however, be a new large public office, measuring 42ft. by 32ft. 6in. The front will be ornamented with both circular-headed and pedimented windows and bold moulded cornices.

A new bridge is being built over the Dee, at Penylan, by Mr. Hardcastle, and the first stone of the column on the Shropshire side was recently laid.

New grammar and infant schools at Abingdon were commenced last week. The buildings will be of brick, with bands of coloured brick and stone introduced, and will be erected by Mr. Charles Claridge, of Banbury, at a cost of £4,610, from the designs of Mr. E. Dolby, architect, of Abingdon.

The Poor Law Board has sanctioned the plans for the new St. Pancras Infirmary, at Highgate, which will cost £40,000.

New schools, in connection with the London-road Congregational Church, Chelmsford, were opened on Wednesday week. The buildings are of white brick, relieved with yellow bands and arches, the style being Romanesque. Mr. C. Pertwee, of Chelmsford, is the architect, and Mr. Henry Gozzett, of Woodham Walter, was the contractor. The cost is £2,500.

The plans for a new convalescent hospital, which is to be built at a cost of half a million, have been prepared by Mr Dale, New Inn. The architect has planned out six separate dining-halls, library, reading, billiards, and smoking rooms, gymnasium, and baths; and hygienic principles will be observed in regard to ventilation, water supply, drainage, &c. It is intended to accommodate a thousand persons at one time.

The new London University buildings are so far advanced, interiorly, that an examination of candidates for degrees in science is being conducted in two rooms at the back of the building, which is much more forward than the front portion.

A new lunatic asylum for the county of Berkshire has been commenced at Wallingford, near Moulsford station. The first contract, for the sum of £46,000, has been taken by Messrs. Mansfield and Price, of London.

TO CORRESPONDENTS.

Notice.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

Received.—E. S.—R. L.—G. E. S.—G. R. T.—I. C—G. R. and Co.—W. O. C.—G. F.—A. B. T., with photos. O. W. D.—C. S., with article on ventilation of drains.—C. R. and Co.—P. and B.—I. T. G. E. S.—I. S. D., with designs for stencilling, which will probably be inserted.

F. L., Jersey.—A short account of the action and construction of Norton's tube wells will be found in an article on "Artesian Wells," in the Building News of Dec. 27, 1867.

Correspondence.

THE PROPOSED DESIGN FOR A NEW NATIONAL GALLERY.

To the Editor of the Building News.

Sir,—Allow me, I beg, to say a few words respecting the view you lately published of the new National Gallery. The simple public probably believe in the bonâ fide nature of the representation, and expect the building to look in execution as there portrayed. That it can and will do so is simply impossible. The original drawing which was submitted in competition was a very beautiful one, no doubt, much advancing Mr. Barry's interests and doing his artist infinite credit. But to allow perspective views at all in a competition without fixing the position of the supposed spectator and the height of the horizontal line is a great mistake. Competition perspectives are, as a rule, purely hypothetical, imaginary representations under the happiest conditions, poetically pretty, but flagrantly false, and of this kind is the view under consideration. It is an impossible one. The spectator must be supposed to be in the Strand with one side of Trafalgar-square (Morley's Hotel, &c.) swept away, and the said spectator to be elevated 20ft. in the air to get such a view! The figures, too, and the distant buildings are much too small, so giving undue size and importance to Mr. Barry's design. The view is, in fact, false and mischievous, a delusion and a snare, and something more truthful should at once be produced. There ought to be views made as the building would show within the limits of Trafalgar-square, both from the upper and lower parts, the horizontal line kept at correct height and no fudging. Considering the amount of discussion and wrangling, the decisions and changes of purpose, and general anxiety there have been during the last five and-twenty years on the subject of a new National Gallery worthy of the finest site, if not in Europe certainly in London, it ought to be faithfully shown and clearly understood, before a brick or stone is laid, what we may expect. A correct view from the lower part of the square would show the domes considerably lower than in present view, the lines of cornices &c., more rapidly declining, the breaks of front much more prominent, the east side not seen, and the whole building much less regular and imposing. On the north side of square the differences would be still greater. From thence the domes, even the centre monster, would be, I expect, invisible.—I am, &c.,

P. E. M.

EXHIBITION OF STUDENTS' WORKS. KENSINGTON MUSEUM.

Sir,—Having last week forwarded you an account of the architectural works exhibited in the above exhibition, I now pass a few remarks on the designs submitted for articles of manufacture, viz., such as carpets, muslins, surface decorations, pottery, &c., and it is a question requiring much consideration as to how to criticise most of the drawings, for, although they all, more or less, possess many faults, one scarcely has the courage to point them out when he reflects upon the age of the students by whom such works were produced; in fact, it is simply surprising how some could have designed and executed them at all, and particularly in two or three instances. It is incredible how such designs as those of Messrs. G. Clanson and A. Poole could be the result of students only sixteen years of age, but I have every reason to believe they are, and consequently the art schools are not such a failure as a great many are too often led to imagine.

Now let none of these young gentlemen feel annoyed or disheartened in whose drawing I may point out a few errors; but let them pause over them and try to avoid them in future, for all who have had any experience whatever in art are aware of the follies and eccentricities of the beginner, who, after having designed, as he believes, something original, no matter how absurd or ridiculous it may be, is reluctant to remove it at the advice of his more experienced masters. I am sorry to say that this obstinacy is possessed by not a few of the more advanced students, and who, like idle schoolboys, discover their error when it is too late to amend it.

The following is a list of the successful competitors in the branches named at the commencement of this article, the gold medal having been awarded to the four following pupils:—Mr. G. Clanson, designs for a piece of tapestry and carpets, most successful both in form and harmony of colour, in two cases especially; Mr. G. Broadhead, for a lace curtain, possessing many good points well worthy of study; Mr. F. Brett, for designs for wall paper—though the form is not so happy, the colour is superb, principally composed of green grays, relieved here and there by a large red flower, unknown, I am sure, to any botanist, but in its right position here; and to Miss Brooks, also for wall paper of very insignificant design. The following pupils have had the pleasure of receiving the silver medal:—Mr. A. Braker, for designs of subjects suitable for stained glass, most beautifully drawn and indicative of great power; Mr. Smith, design for a rug, possessing good colour throughout; Mr. M'Irwin, design for a carpet, very straggling design, colour passable—in my estimate not worthy the silver medal; Mr. N. Nicholson, design for muslins, a little too wiry; Mr. W. Murray, surface decoration—very poor, both in design and colour, from a student whose age is eight-and-twenty; and to Mr. W. Scott, watch covers,—sorry to see such beautiful designs crammed into so small a surface. Bronze medals have been awarded to E. Slocombe for some spirited designing in metal work; J. Trego, watch covers; T. Stone, for card backs, the whole well worthy of inspection; F. Jones, age fifteen, for an attempt at designing plates; Mr. W. Scott, for ribbons; J. Frost also, for ribbons of very good design; Mr. W. Johnson, for two slips 3in. wide, surface decoration, good in colour and design—why make leaves of slight lines connected by acute angles? in nature not even the ivy is such; Mr. H. Clarke, a carpet, colour good, as long as it remains at that scale; Mr. W. Arnold, Mr. P. Kirkby, and Mr. R. Gates, for designs for muslins; Mr. F. Hall, ribbons—nice colour; Mr. S. Stevenson, wall paper, very good indeed; Mr. J. Harris, lace, the masses being most beautifully disposed; Mr. H. Goodhall, wall decoration; Miss Freeman, lace curtains; W. Stanly, surface decoration—why fill up hexagons, cinquefoils, &c., with a design when there is no use for it when executed? and also to Mr. J. Turner, for specimens of illuminating. Are they supposed to be designed or copied, as I cannot waste my time in finding out what stage A, B, or C means? Prize books have been awarded to Mr. F. Reading, J. Slater, R. Young, J. Watson, J. Turner (age thirty-five), J. Weir, W. Burnett, Miss S. Gibbons, J. Thatch, E. Buckler, F. Spring, J. Guthrie, A. Webster, J. Johnson, D. Dudson, J. Wright, A. Poole (for a magnificent design for a carpet), and to Miss S. M'Gregor, (for anatomizing flowers suitable for ornament). Among the unawarded drawings, the following are those to which I would call the visitor's attention:—A design for a carpet, by Mr. E. Poole; a silver bridal cup, by Mr. H. Mason; and iron railing, by Mr. W. Morgan; book covers, by Mr. T. Ritche; wall papers, by Mr. C. Jockel; a design for a tile floor, by Mr. Guthrie—good as a surface design, but for tile flooring most absurd; and ribbons, by Mr. Thomas; and, for curiosity, to a design for a carpet—a most extraordinary production, the colour being composed of scarlet, French blue, chrome yellow, and emerald green, but it nevertheless is very good for a child not more than fourteen years of age.

Now, after examining the whole of these designs, one clearly discovers the feeling of the age, and how the natural curve that was so much admired by the ancient masters, and Hogarth's line of beauty and grace (that we were told was the foundation of ornament), are now falling to decay, and their position occupied by the more geometric style of the compass and square. Now the fault of the curvilinear design, if overdone, is that it impresses motion with confusion, but the latter, nevertheless, is exposed to the same danger, for a straight line here terminating with a conventional ivy, and another with a flower, composed of so many dots, is suggestive of anything but tranquillity. We ought, therefore, to draw a line between these two extremes, for there is little doubt but that the beauty of ornament lies in its simplicity and repose both in form and colour. But the aim of the present generation is change and novelty, not only in the works of the architect and ornamental designer, but even artists will have to give us wonderful productions yet, such as drawing without shadow, lose sight of perspective, revive the gilded backgrounds, talk up Purigino, Fra Angelico, and the mediæval illuminators; run down Rubens, Rembrandt, and Turner. All these things must be done, though its career be cut short before the thirst for change be satisfied.—I am, &c.,

H. A. G.

COMPETITION PLANS FOR WALWORTH COMMON ESTATE.

Sir,—As an unsuccessful competitor I feel at some disadvantage in making any remarks on the decision lately arrived at by the Poor Law Guardians, but in justice to myself and a great number of my fellow competitors, I must protest against the utter inconsistency and absurdity of that decision, and the injustice that is done to a body of gentlemen who have devoted much time and labour to the preparation of the plans, which the result shows might just as well have been spared. The facts are, that the three prizes offered by the Guardians for the best plans have all been awarded to competitors who are connected with the parish.

To this I would make no objection if the plans were in accordance with the instructions of the Guardians themselves, as printed and circulated amongst the competitors, or that they possessed superior merit to those plans which have adhered to the instructions.

On reference to the selected plans (especially the first and second prizes), it will be seen that they are entirely at variance with the instructions in several important particulars; whilst I, and many others of my professional brethren who sent in plans, imagining that the instructions were given bona fide, and that the points I allude to were of importance, have taken especial pains to adapt our designs to the supposed requirements of the Guardians. It was distinctly stated that "the Guardians require two good roads, from 55ft. to 60ft. in width, to intersect the estate from west to east." Two of the selected plans do not strictly comply with that part of the instructions.

The one receiving first prize has the principal roads on one of his plans only 50ft. wide, and on the other only 42ft., 45ft., and 50ft. wide.

The one receiving second prize has the principal road only 45ft. wide, in other parts 50ft. wide (although marked on his plan 55ft.)

And the one receiving third prize has interfered with the workhouse grounds; but his general design is good, and is really the only one of the three entitled to a prize.

All the plans selected interfere with the stoneyard. The plan receiving second prize shuts up Boundary-lane, which has been a public road for twenty or thirty years.

I can give you other instances, particularly with regard to the arrangement of the other roads and building sites. The plans receiving first prize show the largest number of sites, but their frontages are only 15ft. to 16ft., and many of them are fronting the main roads, and many are only 13ft. wide (although stated by the authors in their report that none are intended to be less than 16ft.). Likewise they also contain sites which are only 35ft., 40ft., and 45ft. deep, and are arranged quite regardless of uniformity, ventilation, and sanitary arrangements, as required by the instructions.

The plan receiving second prize has six courts from 15ft..

to 20ft. wide, with sites 42ft. and 45ft. deep, also sites for houses fronting the main road not 40ft. deep; a lane, 500ft. long, 20ft. wide, with fifty-six houses introduced, which have no fore courts; and many measuring only 30ft. and 40ft. deep. So much for sanitary arrangements. Plans A, C, and D, all interfere with the workhouse buildings, whilst several of the rejected plans have strictly complied with the instructions and contain nearly as many sites, and with frontages of 18ft. to 20ft., and depths not less than 55ft. and 66ft.

I think I have said enough to show the folly of a professional man, a stranger to the members of the board, attempting bona fide to compete under such circumstances, and to devote time and labour only to find himself stultified in such a decision as the one arrived at. If the plans had all been sent in under mottoes and had been examined and decided on with the assistance of a professional man, as suggested both in the *Builder* and to the Guardians themselves, there would have been a very different result; at any rate, the unsuccessful competitors would, I am sure, have been better satisfied than they are likely to be.

It just comes to this, that the Guardians have issued instructions which they have not abided by in their decision, or that they have so far altered their views as to put a number of gentlemen (whose time might have been better employed) into an extremely false position.

As the plans are to be open for inspection at the Walworth Vestry this week, I fearlessly refer the ratepayers of the parish, or any professional gentlemen, to the plans selected, and beg that they will compare them with the rejected ones, and the facts stated in this letter.

If the Guardians have decided in error of the measurements here referred to, let them, in justice to the other competitors and for the sake of future competition, re-examine and re consider all the plans with professional aid, and a "true verdict give" according to merit.—I am, &c.,

FREDERICK A. KLEIN.

Intercommunication.

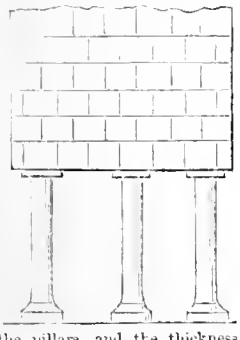
QUESTIONS.

[937.]—GAUGED ARCHES.—Would any of your contributors to "Intercommunication" let me know of the best way of setting gauged arches. Should they be set only with putty, or ought cement to be used for the bed joints and putty for the outside, or pointing, as it might be termed?—BRICKLAYER.

[938.]—PLASTERING.—I should take it as a favour if any practical plasterer would tell me what is the difference between the material used in the first and second coat, that is, between laying and floating? I have always understood that the stuff for floating should be rather thinner, and more hair put in it than for laying.—M. N.

[939.]—ORNAMENTAL WATER.—I am getting out some ground for a circular piece of water in a park, and I wish to know how much it will hold when full. The outside diameter is 23ft. 6in; the depth, 4ft.; and the slopes 2 to 1, which will make the diameter from bottom of opposite slopes a good deal less than the outside one.—HYDRAULIC.

[940.]—CAST-IRON PILLARS.—In the sketch, there is a mass of brickwork, weighing 14 tons, to be carried upon three cast-iron pillars, 9ft. 6in. high. What should be the



diameter of the pillars, and the thickness of metal in them? They are to be placed at equal distances apart, so that between them they will carry the whole load of 14 tons.—L. C. P.

[941.]—TUDOR ARCHITECTURE.—Will any of your numerous readers give me a geometrical rule for determining the exact shape of what is called a Tudor arch? Is it considered a strong form of arch, or only one suited for ornamental purposes?—STUDENT.

[942.]—COLOURING A BLACK BOARD.—Would you or any of your readers kindly inform me of the best manner of colouring a black board, so that the chalk marks may not be visible when cleaned? By so doing you would greatly oblige.—ALBERT.

[943.]—CISTERNS.—Will any of your readers kindly inform me whether lead is preferable to zinc for lining cisterns; and if so, why; and whether either or both metals are poisonous to the water contained in them?—ENQUIRER.

[944.]—WATER COLOUR.—Will anyone kindly inform me of a work on water colour suitable for an amateur architectural draughtsman?—STUDENT.

[945.]—PAPERHANGERS' WORK.—Can anyone inform me, through "Intercommunication," of the proper method for measuring paperhangers' work, and of the difference in measurement between French and English papers?—A SMALL BUILDER.

[946.]—BALTIC TIMBER.—Which are the most useful, the strongest, the best, and the toughest descriptions of Baltic timber? TYRO.

[947.]—CLAY WALLS.—Will some one inform me whether any kind of clay may be made into a clay wall, and what kind of clay is the most enduring; and what materials may be used with different kinds of clays to bind together? C. F. H.

[948.]—MAKING BLUE BRICKS.—Can you or any of your correspondents inform me of the best method of making bricks and tiles a blue colour?—ALFRED MILLS, Spotland-road, Rochdale.

[949.]—BRICK-MAKING BY MACHINERY.—I am proprietor of a small brick yard in this town, and I make some 12,000 per week, all by hand. I find that by the introduction of patent machines in the neighbourhood they can make a better class of brick than mine, sell them at the same or less price, and make them at 10s. or 12s. per thousand, whereas mine cost me about 15s. per thousand; therefore, I wish you would give me your opinion as to which is the best machine to adopt, and the one you can recommend. I want to make from 15,000 to 30,000 weekly. I want the machine that makes the best common brick, and the one that costs the least per thousand for making, least cost for machine, and the one that you can recommend for economy and utility. I have seen several patent machines that turn out 100,000 per week; but I don't want anything of such magnitude as that, as the machine cost over £4,000 putting down; then again I could not find sale for the bricks. I see, from different articles in the BUILDING NEWS, there are a great variety of patent brick-making machines mentioned (I think some 300); therefore I thought it very likely, out of such a vast number, you may find or know of one that will answer my purpose. The best and cheapest one I have seen myself is the one I have mentioned turning out 100,000 weekly, at the very small cost of 6s. 4½d. per thousand, which includes all making and burning complete. I think all is done by machinery—grinding, moulding, pressing, and all complete. There is a great difference between the price I pay and their 6s. 4½d.—Y. Z., Batley.

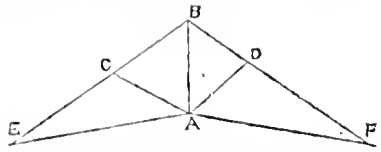
[950.]—ART STUDENTS AT SOUTH KENSINGTON.—In your last week's issue there appeared a letter of criticism from "H. A. G." on the Exhibition of Students' Work, South Kensington Museum. Perhaps "H. A. G.," or some other correspondent, will kindly inform me through your columns the terms of this competition, viz., the qualified ages of intending competitors, the subjects given, the place and time of examination, whether I must be a member of a class connected with the museum in any provincial town, or taking a course of instruction at the museum, or any other information he may imagine I should wish to know, if intending to compete?—A. F. G.

REPLIES.

[900.]—BOLTED GIRDERS.—It appears to me that the gentlemen who have undertaken to reply to "F.'s" query have, in their efforts after facetiousness, rather overlooked the real subject under consideration. The question raised is undoubtedly an important one. "F." states the fact that it has become, through long-established custom, the practice to halve timber when used in large balks for breast-summers and such like purposes. His question, as I read it, is very plain. Is this treatment of the material (the reason for which has been in the lapse of time forgotten) founded on any formerly known law that the strength of the timber is thereby increased? In the absence, as far as I am aware, of actual experiments, the only way to investigate the subject is to consider the advantages and disadvantages of the practice from a common sense point of view. The earliest examples of halved beams date, I believe, long before the use of iron in the form of bolts, when pins or trenails of hard wood were employed to fasten all woodwork. The iron screw bolts of the modern carpenter are doubtless greatly superior to the trenails of the originators of halving. May not the practice have arisen from a desire to discover whether the beam was sound throughout? In the days before Tredgold's tables little was known about the strength of timber, and with few precedents and no rules the early builders were forced to trust to the soundness and excellence of the materials they employed. If my suggestion is correct we can readily understand that in the event of any part of the beam showing signs of weakness they would either reject it altogether, or, as "F.C.H." suggests, reverse the halves end for end (why, by-the-bye, also in the direction of the grain, which surely is synonymous?). Then knowing the heart of the timber to be less liable to be attacked by insects and more durable than the exterior, they would turn these sides outwards. Here we have a simple and rational explanation of the practice. It only remains for us to consider what effect halving is likely to produce upon the sustaining power of the beam. However well joined with the trenails or even bolts, the two halves would lack the cohesion of the undivided balk, and would not, in the case of a weight bearing on one side of the beam, such as a row of floor-joists, act together in resisting that weight. If one-half failed, or the trenails drew a little, the beam would be demolished half by half, which, in the case of the solid balk could never happen. The wrought iron flitch is a modern invention, and does not come under "F.'s" question. I will not, therefore, notice it. To conclude, the chance of making a strong part sustain a weaker, the exposure of the heart wood to the weather, and the power of ascertaining the perfect soundness of the beam, do not, I think, counterbalance the danger of the destruction of each half separately by an unequally distributed load. I, therefore, maintain that the solid beam is to be preferred to the halved one.—GILBERT R. REDGRAVE.

[922.]—UNINFLAMMABLE DEAL FIXTURES.—A solution of asbestos is frequently employed for the purpose of rendering woollen and cotton fabrics uninflammable, and it is very probable that the same method would prove effectual in the case referred to by your correspondent.—CALORIC.

[925.]—SPAN ROOFS.—"Subscriber" evidently does not understand the nature of the action of strains, and, with your permission, I will explain to him what would be the result of his placing a weight in the centre of the tie used. Let a weight be suspended at A in figure; it will, in the first place, be directly supported by the ring rod A B; this rod will, in its turn, pull upon the apex at B, causing a thrust upon the rafters in the direction of their length. This thrust will be resisted at E and F, where it will tend



to thrust out the feet of the rafters, which will be held together by the two inclined ties, E A, F A. It is quite an error to suppose that the immediate effect of the weight would cause the tie rod to bend, or that it would bend if the feet of the rafters were fixed down to the piers. In the latter case, the whole of the thrust would be taken by the fixed points at the feet of the rafters, and there would be no strain at all upon the inclined tie rods. The strains upon a trussed roof require a very careful analysis to investigate them correctly.—CALCULATOR.

[929.]—MATHEMATICAL QUERIES.—There are only two methods of finding the square of a number. One is to multiply the number by itself, which is called involution; and the other is by logarithms. Thus, to find the square of 36 by involution, we have $36 \times 36 = 1296$. By logarithms, putting N for the answer, we have 2 log. 36 = log. N; or $2 \times 1.55630 = \log. N = 3.11260$. On looking for this logarithm in the table we find it to be the logarithm of 1296. With respect to the second part of the question, it may be solved as follows:—Let R equal radius of circumscribing circle about the octagon, and D the length of the required side. Now the side of the octagon is exactly one half of that of a square, but if D be put for the side of the square, we have in terms of the radius $D^2 = 2 \times R^2$; and consequently, since $d = \frac{D}{2}$ we have for the length of the side of the octagon $d = \frac{R\sqrt{2}}{2} = 0.74\,R$.—Q. E. D.

[929.]—"A. P. B.'s" first question—the shortest way to find the square of any whole number—is so simple that I would say let him square it. His second query—as to the best way of finding the side of an octagon, given the radius of the inscribed circle—I think the following rule is about the shortest method of doing it:—Find the diagonal of the square whose side is the radius of the circle; subtract the side from the diagonal, and thrice the difference will be the side of the octagon.—Q. E. D.

[936.]—THE WEATHER AND COAL.—It is of the utmost importance to keep coal as dry and as sheltered as possible from the time it leaves the mine to the time it reaches the stove or furnace. It should be protected from the showers and sun of summer, and from the storms and alternate frosts and thaws of winter, as all coals are affected by such exposure. Anthracite, from its hard, compact structure and glassy substance, suffers least; cannel ranks next; and bituminous coals are most affected. The effect of exposure on the latter class of coal has formed the subject of experiments in Germany, by Herr Grundmann and Herr Varrentrapp. These experiments showed that bituminous coal exposed to the weather in heaps, lost, during a period of nine months, 50 per cent. of its value as fuel. During exposure, the coal undergoes a process of slow combustion, taking up oxygen and giving off the volatile products of oxidation. In this decomposition air and moisture play the principal part, and warmth is the condition promoting it. Coal should never be piled in heaps when wet, and never in great quantities even when dry.—IGNEOUS.

WAGES MOVEMENT.

THE United States statistics of manufactures show a clear increase of 60 per cent. in wages in 1866, as compared with the wages paid in 1860.

At the meeting of the Social Science Association, which will commence at Birmingham on September 30 next, in section IV. (Economy and Trade), the second question for discussion is:—"In what manner can arbitration and conciliation be best applied in the settlement of disputes between employers and employed?"

On Friday last a large number of the operative masons of Halifax struck work for an advance of 2s. a week wages. A six months notice of the intention of the men had been given to the masters, who tried to compromise the matter by offering 7d. per hour wages. The hours of labour for the week are 50½, which, at the rate of 7d. per hour, would raise the wages to £1 9s. 3½d., the present amount being £1 8s. The men object to work under the hour system.

Messrs. Colls and Son, builders, of Camberwell, and of 28, Moorgate-street, received the following notice on Tuesday morning:—"To Messrs. Benjamin Colls and Sons.—Gentlemen,—We have to inform you that a resolution has been passed condemning the system of piecework, which many employers are endeavouring to enforce, and which they well know is most obnoxious to trade unions, and hereby intimate that after the usual period has elapsed such employers deviating from the tenor of the foregoing must bear the consequences.—Yours respectfully, from the General Secret Committee."

STAINED GLASS.

A NEW stained glass window in memory of the late Chancellor Bird has this week been put in Lincoln Cathedral, at the east end on the south side. The medallions represent 'God's Revelation under Three Dispensations: Life in Christ, out of Sin and Death, through Substitution and Sacrifice.' The cinquefoils contain pictures of SS. Peter and Paul, and the three large lights three medallions each, viz., "The expulsion from Paradise, the Sacrifice of Abel, the translation of Enoch, the tower of Babel, the sacrifice of Abraham, the translation of Elijah, the Adoration, Gethsemane, and the supper at Emmaus."

A three-light memorial window has lately been set up at Downham Church, Norfolk. The centre light contains

a figure of our Saviour in the character of "The Good Shepherd," under a canopy, and the side lights each consist of a border with bosses, medallions rosettes, and diagonal texts of Scripture, set on a ground of flowered quarry work. Messrs. Wailes, of Newcastle, executed the window.

STATUES, MEMORIALS, ETC.

AT a meeting of the Court of Common Council on Thursday week, a report from the City Lands Committee, recommending that a bust of the late Lord Brougham be placed in the Guildhall, at a cost not exceeding £200, was agreed to.

LAND AND BUILDING SOCIETIES.

THE report of the Birkbeck Permanent Benefit Building Society announces that the total gross receipts during the past twelve months have been upwards of £400,000 in excess of those in the previous year. Since the last annual statement there has been an increase of £400,080 11s in the gross receipts, of £154,092 17s. 7d. in the deposit branch, of £4,791 2s. 7d in the profit, of 3,063 in the number of shares, and of 2,319 in the number of depositors. The undivided accumulated profits, after providing for all exigencies, amount to £30 281 18s. 8d, which entails a bonus of nearly 56 per cent. upon the total due to the shareholders The receipts for the past year under every branch have amounted to £1 062,585 10s. 7d.

A meeting has been held at Bristol for the purpose of forming a working men's co-operative building society. A resolution pledging the meeting to support the society was unanimously carried.

LEGAL INTELLIGENCE.

AT the Lancaster Assizes, on Saturday last, before Mr. Justice Hannen, the cause of Gibson *v.* the Mayor and Corporation of Preston was heard. The action was brought to recover compensation for injuries sustained in January last, owing to the dangerous state of a public footpath at Preston. The defendants were sued as the local board of health of Preston. Under the 68th section of the Public Health Act it was their duty to keep in repair all the public streets (which include footpaths) within the borough. The plaintiff was proceeding from the railway station in the direction of Walton Parade Bridge, when he stepped into a large hole, and his right leg was broken in two places. A verdict, by consent, was taken for plaintiff—damages £400 subject to leave to move upon certain points of law.

At the Antrim County Assizes, on Thursday week, before Baron Fitzgerald, Mr. F. J. Robinson sued Mr. Archibald M'Crea, a builder, for breach of contract. The defendant had contracted to build sixteen houses for the plaintiff, and to pay a penalty of £1 a day for every day the houses remained unfinished after a certain date. They were not ready for 75 days after the date agreed upon, and the plaintiff, therefore, claimed £75, which sum was awarded to him by the jury.

CLERKENWELL POLICE COURT.—On Friday, the 24th inst., Mr. Albert N. Bryett, builder, of 116, St. James-road, Holloway, attended at this court to answer a complaint preferred against him by Mr John Turner, district surveyor of the eastern division of Islington, for erecting a building at the rear of No 36, Grove road, without first having given two days' notice to him, as required by the 38th section of the Metropolitan Buildings Act. This case had been adjourned on two previous occasions to enable the defendant to receive a reply from the Metropolitan Board of Works to a complaint he had made in reference to the proceedings taken by the district surveyor in respect to the said building.—Mr Joseph E. Turner of 36, Gresham-street, E.C., appeared for the district surveyor; and Mr. Ricketts, of 19, Frederick-street, Gray's Inn road, for the defendant.—The facts of the case, as stated by Mr. Turner, solicitor, and borne out by the evidence, were as follows:—That on March 23, 1867, notice was given by Mr. Bryett of his intention to erect six houses, shops, and additions in the Grove-road—the size of each of the proposed buildings given in the notice was equivalent to an area of 549 superficial feet. In November last the roof of the house No. 36, Grove road, was covered in, and the building, as then carried up, was found to contain an area of 956 superficial feet. In the month of January last the district surveyor had occasion to visit the premises, when the house was occupied and an oven had been erected by another builder, and that on April 21, 1868, he discovered the building in question began at the rear of the house, and for which he required notice, which had not been given. The sections relied upon by the solicitor for the district surveyor were the 9th, 27th, 28th, 40th, 41st, &c On the part of the defendant it was contended that works were going on from time to time on this and the other houses mentioned in the original notice, and that even at the present time all the houses were not thoroughly finished, and that the building in question was simply a coal cellar, of about 7ft. high, and was included in the description of "additions" contained in the original notice of the houses; he also contended that, although this house was "covered in" at the time stated, yet, as the remaining houses, for which notice had been given, were not in such a forward state, this house could not be considered to be completely finished, and that, according to one of the interpretation clauses of the act, the term "area of a building" was not to include "attached buildings, the height of which did not exceed the height of the ground story."—The magistrate (Mr. Barker) decided that, as the house was proved to have been covered in at the time stated, and taking into consideration that the area given in the notice for the houses was considerably exceeded, although the other houses might not have been completed at the same time as No. 36, Grove-road, yet to all intents and purposes each house, although included in one notice, must be considered as a separate building, the rules of the act applied to each individually; and the work complained of having been commenced after the roof of the house, No. 36, Grove-road, had been covered in, notice should have been given to the district surveyor; he should, therefore, impose a nominal penalty of 5s., and award two guineas costs.—Mr Ricketts stated he was instructed to ask for a case which was granted.—Mr. Turner, the district surveyor's solicitor, informed the magistrate the decision of the Metropolitan Board of Works to the complaint made by Mr Bryett was in accordance with his (the magistrate's) decision.

NOTICES OF BOOKS.

Modern Industries: a Series of Reports on Industry and Manufactures, as presented in the Paris Exposition in 1867. By Twelve British Workmen visiting Paris under the auspices of the Paris Excursion Committee. London: Macmillan and Co.

THIS volume is similar in plan to that issued some time since by the Society of Arts, the principal difference being that the former volume was composed of reports written by workmen specially chosen by the Society of Arts, and the work before us contains the picked results of a prize fund raised by the Paris Excursion Committee for the purpose of rewarding the authors of the best reports on the various subjects. Appearing as it does before the public after the publication of the work issued by the Society of Arts, it is likely to evoke less public interest than it deserves, or would otherwise have done. It comprises twelve separate reports on pottery and porcelain, gold and silver work, maps and educational appliances, preparation of leather, watchmaking, iron, china and ceramic ware, cabinet-work, cabinet-making and the woods employed in it, tools and machinery for the manufacture of steel and iron, and brickwork and concrete building Some of them contain a large amount of really good information; and in another column will be found a lengthy extract from Mr Hooper's report on the woods employed in cabinet-making Every paper is characterised by an earnest desire on the part of its author for a larger share of the advantages derived by their continental brethren from their more frequent opportunities of visiting the national museums and the acquirement of art-education. One or two of them, indeed, cry out in a somewhat un-English manner for the more direct interference of the ruling powers in the industry and recreations of the people. The work has been edited by Mr. J. T. Dexter, the corresponding secretary to the committee; but no alterations have been made except such slight changes in the punctuation and the form of expression as were absolutely necessary to render the sense clear.

St. Davids: Its Early History and Present State. By an Ecclesiologist. Bemrose and Sons.

PARTAKING somewhat of the nature of a popular guide book, this little work affords a good idea of the ecclesiastical buildings of St. Davids, one of the most interesting places in the Principality. Situate in the Hundred of Dewisland, a peninsula of Pembrokeshire, it is comparatively unknown to English tourists, yet few localities abound with greater interest to the antiquarian and the architect. The cathedral, built in the twelfth century, and the Bishop's Palace and College which adjoin it, are all in a very sad state, the condition of the two latter being positively ruinous. The cathedral itself, as our readers will remember, has been partially restored by Mr. G. Scott, but the eastern portion yet remains untouched. Detailed descriptions of all the buildings are given, and the principal of them are illustrated by lithographs. St. Davids was a place of considerable importance during the occupation of the Romans. They had a station there called Menevia, from which a Roman road ran through Pembrokeshire, and, passing through several counties, terminated at Bishop Wearmouth. At the present day the general aspect of the place is very poor; the houses are meanly built, covered with thatch, and smeared with white or yellow wash Architectural tourists would find the time spent in a short visit to St. Davids by no means wasted. There are ample materials for their sketchbooks, and they may acquire at the same time renewed health and fresh knowledge.

Catalogued Examples of Medieval Art Metal Work. Joseph Ratcliff and Sons, Birmingham.

THIS catalogue illustrates the metal work in the mediæval style which the Messrs. Ratcliff are prepared to supply. It contains twenty-two designs for door hinges, twenty handles and closing rings, upwards of forty finials and vanes, and as many patterns of railings and gates. For baptistery, chancel, and other screens and gates, four good designs are furnished, besides a large number for altar rails, standards, brackets, lamps, &c. The style is, for the most part, that of the twelfth century, and the designs are, with few exceptions, remarkably good, the most successful being those for door furniture. The railings, at all times difficult of treatment, admit of considerable improvement, especially those designed for streets or boundaries, where delicate parts are exposed to injury from wantonness or carelessness. The designs for gas branches are good, and so are some for lamps. Those for coronæ and chandeliers we do not particularly admire. Messrs. Ratcliff call attention to the brilliancy of their burnished brass work, and state that "the great value and apparent beauty of wrought surface decoration have induced us to apply a process hitherto patent only to the French art metal works in the mediæval revival—viz., the calling into use the services of the sculptor and chaser to assist in producing works of that characteristic and vigorous detail peculiar to the twelfth century, and hitherto eliminated from the modern English middle age metal work revival" They also intend to publish at an early date designs in the Italian, Flemish, and pseudo-Classic styles. They have been established for more than half a century.

Our Office Table.

The *employees* of Messrs. Morant, Boyd, and Morant, of 91, New Bond-street, had their first annual dinner at the Crown Hotel, Broxbourne, on Saturday. The principals were all present, and entered most cordially into the entertainments of the day. Various amusements were provided, and a very pleasant day was spent by all.

The death of Mr. George Cattermole, R.A., the water-colour artist, took place in the sixty-eighth year of his age, at Clapham, on Friday last. Mr. Cattermole was chiefly remarkable for his vigorous painting of scenes of feudal life. Several of his works are in the water-colour department of the Leeds Exhibition. He was elected R.A. in 1848.

The domes of the Metropolitan Meat and Poultry Market are covered with stamped ornamental shell pattern copper, with ornamental copper dormers. The work, which has been executed by Tyler and Company, of Abingdon-street, presents a fine and picturesque appearance, and is well worthy the attention of architects.

At a meeting of the shareholders of the Whittington Assurance Company, on the 16th inst., the thirteenth annual report was presented by the directors. The business of the company has prospered to a very satisfactory extent, the premium income for 1868 being £25,884, as compared with £15,001 during 1866 and £20,446 during 1867. The directors remind the shareholders that the next triennial bonus will be declared at the end of the present financial year and look forward to that event with the expectation of its affording substantial proof of the satisfactory character of the company's past proceedings.

On Thursday week a meeting on the subject of Museums of Trade and Industry was held in the assembly-room of the Metropolitan Club, Piccadilly, under the auspices of the Public Museums and Free Libraries Association. Mr. John Holms, D.L., F.R.G.S., presided. Mr. W. H. Ablett, formerly of Coventry and Macclesfield, read a paper, which was further illustrated by means of collections of textile fabrics placed for close inspection by the audience. Resolutions were passed, unanimously recognising the importance of Mr. Ablett's scheme, and urging their consideration by the Government and the public, in the interests of our industrial and commercial enterprise; and at the close thanks were voted to Mr. Ablett for his paper, to the committee of the Metropolitan Club, and to the chairman.

A few days ago, Mr. William Dashwood, of Whippingham, Isle of Wight, on examining a piece of fir timber about 30ft. long lying by the roadside, found, on the side exposed to the sun, a number of nicely drilled holes, about 3in. deep, the circumference being large enough to admit a large wasp. On a closer examination of the timber Mr. Dashwood saw marks of other holes being bored from within, and found that each contained a fly working its way out. Two of these flies were secured. One is of somewhat greater circumference than a large wasp, and is 1¼in. long; the other is a trifle less in circumference and 1¼in. long. Their wings are like those of the dragon fly. It is supposed that they were bred in the timber, which was perfectly sound when laid down a few months ago.

The current and final exhibition of national portraits, South Kensington, will close on the 22nd of August. On and after Monday next the gallery will be open free on Mondays, Tuesdays, and Saturdays; on Wednesdays and Thursdays the charge for admission will be sixpence.

The German traveller Rohlfs has arrived at Bremen from Abyssinia. At Lallibala, the holy city of the country, he found nine Christian churches of the Primitive Byzantine style of architecture, all monoliths—that is to say, each hollowed out of one enormous block of stone, and richly ornamented. In passing by Axum he found that the last of the obelisks standing is in a state of almost complete ruin.

M. Blasius, director of the Brunswick Museum, has just made a discovery which causes a considerable sensation in that city. He has discovered that former conservators have carried off by degrees a large number of valuable objects of art. Thus at present ninety pictures are sought for in vain, five of them by Albert Durer, and several others by masters such as Paul Veronese, Murillo, Van Dyck, &c. The whole of the etchings by Rembrandt have disappeared, except eight, and the same with a collection of Chinese objects in steatite. The value of the Roman coins, &c., which have been taken away alone amounts to £1,400.

New York papers make mention of a simple but ingenious machine which has lately been constructed there, by which it is intended to light the gas lamps in the city. It is an adaptation of electricity, and by its means the entire city can be instantaneously lighted. The cost for the apparatus for the whole of New York is estimated at 38,000 dollars, which, it is alleged, will be more than saved in labour and gas in one year.

Her Majesty has been pleased to confer upon the Birmingham Society of Artists (one of the oldest, if not the oldest and most flourishing societies in the provinces), the title of "Royal," and in future it will therefore be styled "The Royal Birmingham Society of Artists."

The north-eastern portion of the burial-ground adjacent to St. Paul's Cathedral has not hitherto shared in the improvement of the remainder. It belongs to the parish of SS. Augustine and Faith, being, in fact, the burial ground of that church. The churchwardens have laudably resolved to put it in order, and have appealed to the public for help.

The Ipswich Fine Arts and Industrial Exhibition, in connection with the Ipswich Working Men's College, was opened yesterday (Thursday).

The report of the Select Committee on the House of Commons Kitchen and Refreshment Rooms was published on Saturday last. The committee dissent from the recommendations of the Select Committee on House of Commons arrangements so far as the removal of dining rooms and kitchens is concerned, and are of opinion that the proposition for converting the conference and committee rooms into dining rooms, with new kitchens and offices, is the best that has been devised for the accommodation of both houses. Such a plan, we believe, would not be incompatible with carrying out in other respects the recommendations of the "arrangements" committee should it be thought desirable to adopt any portion of them.

At a meeting, on Wednesday week, of the special committee of the Dublin Municipal Council, letters were read from Mr. James Synan, C.E., of Ballinasloe, suggesting the excavation of the bed of the River Liffey to the depth of 18in., which would bring it to a level uniform plane, and that the stuff should be towed out to sea in boats, which plan would remove the bad odours at present emitted from the river. The City Engineer was directed to report on the plan, and the engineer to the Dublin Port and Docks Board has been requested to do likewise.

Mr. T. Baker, late second assistant clerk in the City Architect's office, has been elected to the new post of "surveyor of the City and Bridge House Property." There were two other candidates, viz., Mr. J. W. Forge, surveyor, and Mr. J. Liddiard, surveyor.

Minto-street, Bermondsey, it is said, "has not been swept since the heavy fall of snow last March twelve-month, and only watered twice in that time."

Maiden-lane, King's Cross, is to be widened on the west side, near the railway bridge, the North London Railway Company having ceded to the St. Pancras Vestry a large piece of land for that purpose.

The French Government has just informed the Chambers of Commerce in the chief maritime towns that large sales of timbers in the Crown forests of Corsica will take place this year.

The Highways Committee of the Paddington Vestry have now under consideration a proposal to widen the Harrow-road between Edgware-road and Paddington Green.

The canal basin, Paddington, is in a dreadful condition, the recent cleansing having had but a partial effect. The authorities of St. Mary's Hospital have remonstrated with the vestry, stating that the effluvium arising from the water is extremely prejudicial to the health of the inmates. The Metropolitan Board of Works is said to share much of the blame, they requiring too extended a notice before a remedy can be applied.

In a street abutting on Regent-street, twenty-six houses have been measured for the purpose of introducing the Lodging House Act; and allowing 500 cubic feet for each person they should have contained 198 people. It was found, however, that no less than 549 human beings were sheltered in these houses, giving an excess of population in twenty-six houses of 351 persons. Dr. Lankester is of opinion that 500 houses in the district of St. James's, Westminster, are thus overcrowded. At the lowest calculation this district contains 7,000 more inhabitants than law permits, and as there is no probability of extending the building accommodation it is only by sending the excess of population out of the parish that the provisions of the act can be carried out.

Mr. G. A. Jermyn, a surveyor and draughtsman well known to older members, died on the 17th July, at the age of sixty-two. Among his drawings was a measured drawing of Waterloo Bridge for the Messrs. Rennie. He designed a Moorish arch for the Great Globe in Leicester-square, which perished with that structure. Mr. Jermyn had been long connected with the Institution of Civil Engineers.

The "knockers," as the boys call them, are being put up in succession on the Thames Embankment. The Temple has lions' heads on its river front, though they might have been varied here by the lamb and the pegasus. It has been suggested, as a means of making the knockers useful and giving help to persons falling into the river, that chains should be put in festoons from lion's head to lion's head, but a better way would be to let a chain hang from each ring, which could be made ornamental. It is, however, stated by the lightermen that the water thieves would carry off the chain as they have stolen other objects to the damage of the stairs on the river. Perhaps the patrol of the police on the embankment would save the chains.

Water companies are perfectly justified in prosecuting unscrupulous individuals who appropriate water by unlawful means and then evade any payment for it, but their zeal may be carried a little too far. At the Sheffield Police-court, on Friday last, a respectable inhabitant of Crosspool, a village within the boundaries of the borough of Sheffield, was summoned by the Sheffield Water Company for unlawfully taking water from a conduit, which runs past the village for the supply of the town. Crosspool is not supplied with water by the company, and in consequence of the long-continued dry season, the ordinary sources open to the inhabitants of obtaining water had failed. The water was taken by the defendant for the use of a brother who was dying, his medical man having prescribed cold water as part of his treatment. At the time he took it he gave his card to a watchman in the service of the company, and offered to pay the value of the water. As a matter of law the defendant was convicted in a penalty of 2s. 6d. and costs, but the two magistrates who heard the case expressed themselves pretty strongly upon the necessity of a better supply of water being procured for the town, and upon the desirability of the supply being in the hands of the governing body of the town. A project for the purchase of the company's works is at present under the consideration of the Town Council.

THE BUILDING NEWS.

LONDON, FRIDAY, AUGUST 7, 1868.

THE PROPOSED NEW PUBLIC OFFICES.

THE few beautiful moonlit evenings which have occurred since the promenade along the new Embankment was opened to the public from Westminster to beyond Waterloo Bridge, have revealed in it a potent and enduring source of delight, such as the inhabitants of London could previously have had only a faint conception they would ever have had placed at their command. It may safely be said that no city in the world possesses anything comparable to the magnificent reaches of the Thames, which both to the right and left now greet the eye of the spectator as he paces the crescent curve formed by this noble causeway of granite. It would be hypercritical, where there is so much to admire, to seek out for faults, and our present purpose is not to criticise details, but to consider the opportunity recently afforded by this embankment for the architectural embellishment of the metropolis, more particularly in connection with the contemplated scheme for building the various Government offices said to be needed by the nation, as well as with regard to the proposed new Law Courts. The partial completion of one block of these offices (the Foreign Office) has to a certain degree decided the mode of their general arrangement, and renders it quite unnecessary to consider the idea, once propounded, of concentrating them all into a vast parallelogram of architecture. This was prominently put forward in an able pamphlet by Mr. Hope* during the time of the exhibition in Westminster Hall of the competition designs for the Foreign and War Offices. We do not greatly regret the impossibility of carrying out such an idea, as we are unable to endorse the opinion he so strongly expressed therein that it would be desirable, even if it were practicable, again to isolate Westminster and its palaces from eastern London, as was the case in the Middle Ages. We think it essential to preserve their present union with the great City of London by the means of a continuous street—*let it be a street of palaces*—extending from Trafalgar-square to the Abbey precincts. At the same time we quite agree with Mr. Hope that the splendid cordon of parks, which forms so unique a feature in our capital, should—nay, must—be carried down to the river side, with spaces sufficient to afford good vistas left between the separate blocks of buildings which would form this street. These buildings might, perhaps, be themselves united by means of screens somewhat of the character of that by Mr. Decimus Burton at the entrance to Hyde Park, or by arcades which might support galleries of communication, and thus a semi-rural, semi-urban character be preserved, and quiet secured to the occupants of the offices.

Since the conditions for that competition for the block plans and the approaches to the new Palace at Westminster were laid down, a considerable portion of the ground necessary to be obtained has been purchased, and the embankment, then hardly more than contemplated, has been erected. A wider view of the subject is, consequently, more possible now than it was then, and it is probable that the next Parliament will take such a view; it becomes, therefore, important to consider and ventilate the subject well in the interim.

In a letter from W. H. Gregory, Esq., which appeared in the *Times* of July 30, attention is called to the three plans for the concentration of the public offices which are embodied in "the report of the commission appointed by Treasury minute of November 23, 1866, to enquire into the question of the accommodation of public departments." These plans are entitled respectively, "the First Commissioner's plan," "Sir Charles Trevelyan's," and "Lieut.-Colonel A. Clarke's plan of 1865-6." Each of these plans Mr. Gregory considers to deserve attention, although he dismisses Colonel Clarke's somewhat too summarily, it appears to us, on the ground partly of want of the necessary concentration, and partly on the score of expense. He then refers to that which goes under the name of the Chief Commissioner of Works, the main features of which, he says, "are to extend the Admiralty into Spring Gardens, and to place the War Office by the side of the Horse Guards, on the ground now occupied by the Treasury, Board of India, and Privy Council. These offices are to be removed and to form part of a large block of buildings which are to extend from the present India and Foreign Office into Great George-street, Westminster."

This plan he criticises from the practical point of view, as not providing for the Horse Guards under the same roof as the War Office, as was strongly recommended by the Reorganisation of the Army Committee of 1859, and as not in a strategical point of view providing equal security to the Houses of Parliament and protection to the Royal palaces as that by Sir Charles Trevelyan, through want of direct communication with the Thames and the Embankment for the police and soldiery in cases of disturbance. But the main objection which he urges against it is that it ignores altogether the immense æsthetic advantages offered for the display of the architecture of these several buildings by the frontage to the river.

Then Mr. Gregory powerfully argues for the superiority of the plan which goes by the name of Sir Charles Trevelyan, but which he says in reality is due to Lord Llanover, being "the result of an enquiry in 1856 by a committee of more than ordinary strength."

This plan Mr. Gregory thus describes:—

> Its main features are as follows:—To take in the ground between Bridge-street and Montagu-house, having the Thames as the boundary on one side and Parliament-street on the other, and on that magnificent site, now occupied almost exclusively by squalid, miserable houses, to build the future Admiralty and War Office in conjunction with each other, and with the Horse Guards under the same roof as the War Office. All the other offices he proposes to include in two great blocks on the other side of Parliament-street, the Colonial and Home Offices, in the block of which the India and Foreign Offices form a part, and the last in a block bounded on the south by George-street. Next to the Home Office he proposes to erect a building to take the place of the Scotland-yard depot of police, and, judging from the performances of last year, this proximity will not be misplaced. Between this and the Horse Guards will be another building to hold a detachment of troops in conformity with the views of high military authorities, who consider this to be a necessary provision for the protection of the Royal palaces and the Houses of Parliament in case of any sudden tumult. Exactly opposite to the Horse Guards Sir Charles proposes to open a fine street by the Banqueting-hall to the Thames Embankment, which, as the leases of the houses to be taken have mostly fallen in and the land is Crown property, would combine profit, convenience for traffic, and be no small embellishment, as by some alterations at the Horse Guards, a full and beautiful view from St. James's Park to the Thames would be afforded, and at some future period the original plan of Inigo Jones might be partially carried out in the spirit, if not in the actual letter, of his design. Sir Charles further proposes to extend the road at the rear of Carlton-terrace into Cockspur-street, so that carriages, instead of meandering by St. James's Palace and down Pall Mall, may drive at once from Belgravia into Trafalgar-square. The whole cost of this plan would apparently exceed that of the Treasury plan by about £200,000; but in reality, if we examine closely into the gains and losses on both sides, there would be very little difference of expense.

It is to this æsthetic question that we will principally address ourselves, and, looking broadly at the several plans, it appears to us that each offers some advantages which have been overlooked in the others, that each is worthy of attention, but that the plan to be ultimately adopted should be different from either, for as unquestionably each presents defects and demerits which can and might be avoided.

However, we can and do cordially concur with Mr. Gregory and Mr. Cochrane, who, in his letter to the *Times* of July 31, supported the former in his appeal to obtain a fair hearing for the artistic element in the scheme. "Here," says Mr. Cochrane, "is an opportunity for embellishing the metropolis which once lost can never be regained." He goes on to show that economically there are sets-off against the additional cost of following the most artistic arrangement, but into these we do not propose to follow him. Whether £200,000, more or less, would or would not be incurred by placing one of the buildings, of an equal frontage to that of the Houses of Parliament with its façade toward the river, as Sir C. Trevelyan would propose, cannot affect the decision. Nor, were Colonel Clarke's idea the best to be followed, should an additional million be allowed to stand in its way! "Whatever may be the expense of erecting the new public offices (we are quoting from the report of the Commissioners) the work is intended for the convenience and the ornament of all future generations." This ought to be sufficient reason to discard from the consideration the national habit of cheeseparing, and yet each and all the plans have been spoilt by it. To take a broad view of their several characteristics. Sir Charles Trevelyan's evidently provides the greatest degree of concentration, together with the finest architectural opportunity, by reason of so large a portion of the buildings being on the site facing the embankment; but it errs, together with the others, in sticking the offices, for economical reasons, cheek by jowl, without proper separation. Such a length of façade as that of the India Office and the one to be connected with it should not face a narrow alley such as all three of the plans propose in the place of Charles-street. If a building be worth seeing at all it needs greater width in the street than that given by either of them, and though no one is likely to break his neck with anxiety to examine the small and trivial details of the structure which already forms the greater part of the one side of it, we live in hopes that now that the trammels imposed by Lord Palmerston are removed, no other mass of equal want of interest will be suffered to be erected hereafter.

Then, looking at Sir Charles Trevelyan's plan, we would ask, might not the chief offices of police more modestly retire behind and still be in connection with his "War Department for Guards, &c.," and leave another vista from the park down to the river? To gain so desired an end we must, it is to be feared, lose the present picturesque building of the Horse Guards, although architecturally it is of ten times the value of its recent pretentious neighbour.

Colonel Clarke's plan, in our opinion, is the best of the three, as regards the treatment of Charles-street, though it is far from being liberal enough, and he leaves a fine opening from the park, with Whitehall Chapel as a central feature opposite, his vistas to the Thames being left on either side of it. The Commissioner's plan eastward of the Foreign Office has the considerable merit of hiding the worst part of that building, and of retaining the present Horse Guards; but though the positions of the War Office on the one flank of that structure and the Admiralty on the other may be as convenient as may be desired, the manner in which they are all jumbled together must prove architecturally detrimental both to the present and proposed buildings, and leads us seriously to warn the authorities against such an attempt at patchwork as a certain failure.

We think no one can carefully examine the

* "Public Offices and Metropolitan Improvements." By ALEX. JAMES B. BERESFORD HOPE, Esq., M.P. Ridgway. 1857.

rival schemes without coming to the same conclusion that we have done, that the subject deserves and needs fuller consideration, and that, though each plan has great merits, each has some defects, and that the interim between this and next session will be well occupied in its further and more careful consideration.

The Report of the Commission concludes, we regret to say, with the following unfortunate recommendation, the confident tone of which we are at a loss to understand, seeing that the assistance of Mr. Scott in the preparation of the report is so prominently acknowledged. We allude to the removal of St. Margaret's Church. The Commissioners say they think it right to draw attention to it as a *public improvement* long contemplated, and as naturally following the adoption of the recommendation they have made. They say—"When a magnificent street, 150ft. wide, has been opened from Whitehall to Westminster Abbey and the New Palace, it will become more than ever necessary to remove what will be the only obstacle to the Abbey forming the termination of a vista which will be probably unsurpassed in any European capital." Never was there such a *non sequitur*. We unhesitatingly declare that the removal of this church would be most unfortunate in its effect both to the Abbey, the Palace, and to the new buildings themselves, if they are in any degree better than those of the new Foreign Office. The present contrast of the three buildings in juxtaposition is eminently to the advantage of the larger ones, and they form all together an exquisite group, which would be as irretrievably ruined by the destruction of the smallest as of either of the others. But where are Mr. Scott's "no faltering accents" as regards this point? In Mr. Hope's pamphlet, before referred to, he says—"The English advocate for the retention of St. Margaret's is Mr. Scott, and the French, M. Viollet le Duc," and contends that in saying so he has "urged enough to suspend that unthinking fashion of reprobation with which that church is too commonly visited."

Has the official tyranny of Lord Palmerston quelled his noble spirit? Does the shade of the deceased Premier haunt him still, and prevent the expression of his true opinion? At any rate, Canon Conway and Dean Stanley have spoken out on the subject with no faltering accents, and we trust that their remonstrances will have the desired end. But further, we boldly state that we trust that another point in the Government decision will be reconsidered, that, namely, of which Mr. Gregory reminds us:—"Mr. Scott is to have the erection of the Government buildings." It seems to us preposterous that all the works referred to should be placed in the hands of one architect. Of course, we know that the enunciation of such an opinion exposes us to the imputation of professional jealousy, and that it is thought that all the claimants for Government patronage have been disposed of by the appointments of Mr. Street to the Law Courts, Mr. Waterhouse to the buildings at South Kensington, and Mr. E. Barry to the National Gallery. There were, however, other competitors both for the Government Offices and the Law Courts, and there are other architects; and there will be, before half these offices are finished, other rising and risen men who might fairly ask for a share, or a chance of a share, in this great opportunity, which is one of an age. These, however, are but the claims of the profession. The public may be asked whether they desire or would be satisfied with many more acres of buildings such as the Foreign Office. We have left ourselves no space here to speak of the site of the Law Courts, and can only echo the hope expressed by Mr. Gregory and Mr. Cochrane, that the obvious gain to the architectural embellishment of London by placing such a building upon the Embankment instead of upon the wretched site proposed, will be taken well into consideration before it is too late—a hope in which we are sure the able architect engaged for the work cannot but join.

ARCHITECTURE AND ENGLISH ARCHITECTS IN INDIA.

We are about to refer to an architectural document of some interest to the profession—the statement exhibiting the moral and material progress and condition of India during the year 1866-7, prepared pursuant to act of Parliament, and just printed. This is of course a blue book, and we may be told blue books have nothing to do with architects, and India still less, and that many of our readers care about neither, which we readily believe. We shall nevertheless proceed to pick out from the undigested mass of the report such material as we can find relating to public buildings, and this will be of a very fragmentary character.

There is a heading for public works, and that we shall take first, although it does not contain all the information. The water supply of Fort William, at Calcutta, has been brought into active operation, but it only supplies 4,000 people. The Cartridge and Percussion Cap Factory at Dum Dum has been completed, and good progress made in remodelling the Gunpowder Factory at Ishapore. The Sailors' Home, for unemployed seamen, has been completed. A scheme has been approved for the construction of a small pox hospital in the suburbs of Calcutta. A new arrangement has been made for the pauper and police hospitals, by which the sick poor will be accommodated in the building originally intended for the Sealdah market, and the Amherst-street hospital will be made available for the sick police, while the building at Entelly is to be occupied by cases of cholera and infectious diseases. Slaughter-houses were in progress.

Plans and estimates for the central gaols in Bengal are still under consideration, but it is feared the climate will not admit of their being constructed of such cheap materials as those in the north-west provinces. The central penitentiary for European convicts at Hazareebaugh was nearly completed, and other gaols were in contemplation.

In the north-west provinces they had large military works in hand, the completion of the new barracks at Agra and Morar for artillery, and also some new barracks in the fortress of Gwalior. The construction of the building for the new infantry lines in the cantonment at Nowgong had been begun. New central gaols were in course of construction at Benares, Allahabad, Futtehgurh, Bareilly, and Agra. The public offices at Allahabad had been delayed for want of some ironwork from England. The progress of the Cawnpore Memorial Church had been stopped.

In the central provinces there had been a heavy expenditure on military buildings—at Jubbulpore, Saugor, Kamptee, and Nagpore. In the fort at Sectabuldee permanent accommodation had been ordered for the European garrison, and the works begun. Very satisfactory progress had been made in the advancement of the four central gaols at Nagpore, Jubbulpore, Hoshungabad, and Raipore. The construction of permanent police buildings had been in abeyance, awaiting a revision of the plans. A "handsome" post-office, near the railway station at Nagpore, was near completion, as also a new telegraph-office at Jubbulpore. Of miscellaneous and municipal works in hand, there were water supplies for Nagpore and Hinghunghat, townhall at Jubbulpore, clock tower at Hurdah, market places at Toomsur, Seonee, and Baitool. It is reported there is hardly a town of any importance but has its drinking fountain, well, schoolhouse, dispensary, or some public building, erected by private munificence.

Of the Punjaub there is no detailed report. In the Hyderabad districts, lately assigned, about £45,000 was spent in civil buildings and local works, including two court houses, a gaol for 500 prisoners, several police stations; and at Oomrawuttee several large municipal schemes were on hand. Of English Burmah little detail is given, but it is stated that the new municipality of Rangoon was about spending at the rate of nearly £40,000 a year for improvements.

The chief thing we can make out as to Bombay—for there is no detailed report—is that a new cantonment has been sanctioned at Kolaba for the whole of the garrison of Bombay, including the native regiments. Gas has been introduced into the present barracks. At Poona and Kirkee this has not been found so feasible. A new European general hospital is proposed at Bombay, and alterations have been made in the existing hospital, and gas and water laid on. A new hospital has been erected at Karwar for the police, and a new civil hospital is to be built at Kaira. Considerable progress has been made in lighting Bombay with gas, and eight native gentlemen presented the municipality with large ornamental lamps for central positions. Two additional churches have been built at Poona and Egnthoora.

The Madras report speaks of a very large outlay for public works, but, like many others, gives no particulars, only that the new central gaol at Rajahmundry was completed, as also another at Coimbatore. It appears the Government has authorised the construction of a new passenger terminus at Madras, near the "People's Park." New gaols were in progress at Vizagapatam, Vellore, and Madura. The municipality of Madras has received enlarged powers.

Of miscellaneous matters it may be mentioned that new churches had been erected at Chindwarra and Khundwa in Nimar; that at Hoshungabad was near completion. Funds had been raised for a church at Chanda, and for one at Nursingpore. A new church had been completed at Chudderghat in Secunderabad, and one nearly completed at Berhampero. One was under construction at Tellicherry. All these are in the diocese of Calcutta. Two churches have been completed at Purneah and Aya, and those at Cachar, Arrah, and Motecharree are advanced. The memorial church at Ferozepore has received a tower and spire, and the church at Attock has been nearly completed. At Meean Meer the Roman Catholic Chapel has been enlarged.

Under the head of public works, exclusive of railway and irrigation companies, the outlay was as follows:—

Bengal	£964,742
North West	852,805
Central	442,642
Punjaub.....	871,775
Hyderabad	110,705
Burmah	250,066
Madras	704,609
Bombay, no return ...	—

There are no reports for Oude, Mysore, and Ooorg. The total above reported is £4,200,000, and this constantly increasing expenditure now amounts to about £5,000,000 per annum.

Now come a few questions, first from insensible readers—Who cares about Meean Meer and Moteharree? and one from reflecting readers—Who expends the £5,000,000, and are they architects? This is the real professional question: What share have English architects in the expenditure of about £5,000,000 a year, chiefly for constructive purposes? So far as we know, architects are not employed at all. A very significant illustration of the system is given at page 43, where it is stated "no progress worth noting has been effected in the completion of the memorial church at Cawnpore, in consequence of the want of a qualified assistant as superintendent of the work, the executive engineer's time having been fully employed in another channel." Let us paraphrase this. "The progress of the Public Offices in Downing-street, or Palace of Law, is delayed in consequence of the want of an Engineer to

superintend the decorations, and of the time of the executive Engineer, who has charge of the designs, being fully employed in another channel." "The restoration of St. Mary's, Redcliffe, is going on during the period Corporal Smith can spare from the pot-house in this hot weather, under the casual supervision of Lieutenant Bumblebee, R.E., who is also superintending a fort at Plymouth and a gaol at Gloucester." "York Minster is being touched up by Sergeant Johnson, of the Sappers and Miners, when not disabled by *delirium tremens;* Captain Mudlam, R.E., the officer in charge, being laid up with fever." "The new bridge over the Brent, erected only last spring, has come to grief. The plans of Second Lieutenant Smithers, R.E., were in accordance with book and rule, and approved by Lieutenant-Colonel Robinson, R.E.; but it is supposed the bridge reached its untimely end through Sergeant Browning, the acting official, placing too much confidence in the brother of his native mistress, to whom he gave the contract, and who forgot to put any mortar between the bricks, as specified by the department. Sergeant Browning, a most deserving officer, who built the new church of St. Barnabas, has been severely reprimanded, and sentenced to lose five days' pay."

We do not grudge the proper employment of military engineers or of civil engineers, but let the military engineers be kept to the military works, so far as they do not involve civil economy, and let the civil engineers attend to their departments, in which they have more than enough to do. We contend that the taste of this country is not to be exhibited in the monuments of our rule in India by entrusting their superintendence to military engineers, or to civil engineer assistants who have passed a casual examination in architecture. The whole system must be reformed, and the architect put in his right place, and not, as now, ignored or put in a position of subordination. Public interests and professional interests equally require this change, and we hope the subject may at length receive attention. The civil engineers have done much to relieve themselves from the illicit competition of military engineers, and if architects had the same spirit they would have equal success. About a quarter of a century ago the military engineers had succeeded in invading much of the civil domain in England, but were resisted by the civil engineering press and profession. The result was the military engineers were driven back, and at length their monopoly in India has been assailed, and a civil engineering department has been constituted in India employing a large body of civil engineers, to the great advantage of India, the civilisation and progress of which are much promoted. Of these results the report now before us furnishes frequent evidence.

It will not unnaturally be said by some who think little about the subject—"This does not matter to us, we care nothing about our profession, we are not going to India and do not want to go, we shall stick here and carry on surveying, building, and the copying of other people's designs." Yet the sons of such people might get employment, and bring employment to the paternal shop. At all events, that great body who honour their profession and seek advancement, when once aroused will feel the grievance, which equally affects the older and younger members of the profession. If the older members pursue their practice here they ought to enjoy many advantages in consultation, in supervising designs, and in making visits of inspection to India. Mr. Rendel, C.E., has just returned from such a tour, but which of our architects has been called upon to exercise such a mission? It is well known the consulting business for India affords a lucrative income to many leading engineers.

The time is favourable for the agitation. The Indian public appreciate the advantage of having the services of men of genius and education. The Government is in want of competent assistants, and it only needs a movement to be made. The employment of Mr. Burges to design a school of art for Bombay shows the temper of the Indian public, and the way in which he has been treated illustrates departmental injustice. The Institute and the Association can do no better than in each session to devote special attention to professional interests in India, beginning with next session.

THE VENTILATION OF THE DRAINS AND SEWERS IN TOWNS.

THE death of Mr. Henry Austin, the superintending engineer of the late General Board of Health, was a great loss to municipal authorities. His investigations, had they been continued, would probably have placed the subject of the ventilation of town drainage upon a more satisfactory basis both in the metropolis and other towns than it now rests upon, if, indeed, it can be said to have reached a state of rest at all. His successor, Mr. Rawlinson, has, indeed, contributed in many ways to the interests of municipal authorities in the matter of town drainage, and has fully recognised the value of the proposal of Dr. John Stenhouse to employ charcoal to disinfect the gases that escape from the main sewers, and has frequently warned us not to employ indiscriminately the rain-water pipes of houses for the ventilation of drains; but the numerous occupations of Mr. Rawlinson under the several Royal Commissions that have of late years been appointed to inquire into the disposal of sewage, the remedy for the prevalent pollution of rivers, the employment of the cotton operatives during the American war, &c., have probably diverted his attention from the subject of the ventilation of town drainage to a great extent. Had his predecessor, however, lived as his coadjutor we might by this time have seen more successful results in this matter than we have attained. Twenty years ago, nearly, Mr. Henry Austin arrived at some conclusions on this subject which remain good to this day, and with one exception, viz., that of the use of charcoal, have not been excelled.

His conclusions at that time were that a system of ventilation of the sewers could not be dispensed with; that experience had shown that unless simultaneous provision to effect this object be made, the increased trapping of gullies would render the sewers unbearable and dangerous, and would tend seriously to increase the evils intended to be remedied (the evils, viz., of trapping sewers and drains without simultaneous attention to their ventilation in other places); that the system of ventilation by shafts and grates discharging in the centres of the streets (this, by the bye, was before the use of charcoal had been suggested) was objectionable and ought to be discontinued as soon as better means could be adopted; that any general system of ventilation by connection with furnaces and chimney shafts at considerable distances would be attended with great difficulties and much manual labour and current outlay, without promise of satisfactory results; that the experience obtained as to the draught of air through tubes carried to the tops of houses gave indication that, under proper management, a good system of self-acting ventilation might by these means be established, and warranted the recommendation that a more extensive and efficient trial should be made of it. So far Mr. Henry Austin. Seventeen years afterwards, viz., in the year 1866, Mr. J. W. Bazalgette, the chief engineer of the Metropolitan Board of Works, finds the following four modes of preventing the escape of noxious effluvia from sewers to be those most deserving attention, viz., the use of charcoal ventilating grates; ventilation through chimney shafts and furnaces; ventilation through pipes carried to the tops of buildings; dilution of the sewage with water. Of the first method he reports to the Board generally in favour of it, but recommends further experiments to be made. These he afterwards makes in conjunction with Dr. W. A. Miller towards the close of the year, with results tolerably successful. Of the second method Mr. Bazalgette finds that it can be of but very limited application anywhere, and in some districts could not be applied at all. Of the third method he reports more favourably, having made the trial in eighteen localities on the south side of the river, care having been taken that the tops of the pipes were above, and at a distance from, the attic or upper windows of the buildings, and in none of the instances has any complaint been made by the residents of smell or inconvenience arising from them. Great difficulty was, however, experienced in getting the consent of the occupiers of the houses to such an arrangement, arising from the fear that the foul gases, under certain conditions of the atmosphere, would descend the chimneys or enter the upper windows.

Mr. Bazalgette adds that this fear would, in his opinion, render a universal adoption of the plan impracticable, "otherwise the cost of maintenance would be trifling." Let us hope that a plan that appeared to Mr. Austin to be "a good system of self-acting ventilation," and to Mr. Bazalgette to present as its chief difficulty the fear of occupiers of houses that "the foul gases would descend the chimneys"—that a plan with these merits, and with those we will name presently, may claim the further attention of municipal authorities, and of all those who are engaged in building and draining houses.

It is remarkable that Mr. Bazalgette does not hint at any belief on his part that such a result would take place as that which the occupiers fear; and this might have been anticipated, for when we consider the action of the foul air in the sewers and drains in ventilation we shall see that it is very improbable.

Before going further into the subject we must remark that in speaking of the ventilation of sewers and drains, we mean essentially the ventilation of drains and sewers, for we conceive that to ventilate the latter only is to fall far short of the object to be attained—viz., the purification of the atmosphere both in the streets and in and about the houses. And we will say at once that it appears to us that if the effectual ventilation of the house drains be accomplished, that of the sewers will necessarily follow—certainly, to a great extent, if not entirely. But this can only be the case where flap traps are not used at the junctions of the house drains with the sewers. In any case where flap traps are necessary the system of ventilation by means of the house drains cannot effect the ventilation of the sewers, though it will be equally effectual for the house drains themselves. But, probably, it is a very small minority of house drains in towns generally that are so trapped, and, therefore, let our remarks be understood to apply to the general state of things.

House drains seldom, if ever, run full, and their upper spaces afford a ready outlet for the air in the sewers when there is a free means of escape at their upper ends, nor is their length often sufficient to cause any serious drag to the air in its passage through them. What is wanted, then, is an escape pipe at the upper end of every house drain, or at the upper end of as many of them as suitable positions can be found for, according to the construction of the houses; the essential requisite being that the pipes be carried above the roof and not in proximity to bedroom windows. The action of such ventilating pipes we take to be this. So long as the rain-water pipes from the roof are connected immediately with the drains they flush them with water on the occurrence of every rainfall, and a large body of air is at those times displaced in the drain. If there be an opening in the drain, through which this air may expand, as in a pipe carried up from the head of the drain to the top of the house,

above the roof, it will follow the course made for it, whenever any force is exerted within the drain, as when a rainfall occurs or when the expansion of the sewer gases takes place by reason of their lesser specific gravity. And the fear that this gas will descend again after its dissipation in the atmosphere above the houses seems to be chimerical. Much obloquy has been cast upon this method of ventilation by the indiscriminate attachment of the rain-water pipes to the drains for the purpose of ventilation, for in most cases these rain-water pipes lead up to, or near to, the upper windows of the houses, and any gas escaping from them has a tendency to be blown into the houses; but the case is wholly different when ventilating pipes are specially constructed for the purpose and terminated above the roof. In closely-built towns the wind has often but little action at the street level, but if we ascend to the attics we usually find the air in motion; and the foul air of the drains and sewers is, in fact, blown away above our heads, and so much mixed and diluted with atmospheric air as to be rendered innocuous. If we usually dwelt above our roofs we should hesitate to adopt this plan of ventilation, but seeing that we inhabit usually but a stratum of air of some few feet in height above the ground there need be no fear of the effects of the foul air when dissipated in this way.

The facilities which house drains present to builders to get rid of the rain water from the roofs, when it is not required to be stored for use, have induced a common practice of connecting them directly with each other; but seeing that in most cases the down pipes have their upper ends near the bedroom windows it seems wrong to run the risk of carrying up the foul air of the drains in these places. To obviate this a syphon trap is often inserted in the drain at the foot of the down pipe, to prevent the foul air ascending there, but the lodgment of matter that is brought down from the roofs causes frequent stoppages and outbursts of water on the occurrence of rains. Therefore this cannot be said to be an effectual remedy of the evil it is intended to prevent. On the other hand, these traps are omitted often with the intention of ventilating the drains by means of these downpipes. It is good to have the intention to ventilate the drains in any way, but if we consider the action of the rain water passing through these pipes we shall see the impropriety of attempting to ventilate the drains by them. They are not usually so large but that they are choked by even a moderate rainfall; a 2½in. or 3in., or even a 4in. down pipe with a considerable roof area draining into it, cannot carry down the water and allow at the same time room for the ascension of air, except under exceptional circumstances of violence, and the natural result therefore is that the air of the drains is driven forward and must find its readiest outlet, which is in too many instances the opening of the kitchen sink or of a defective trap elsewhere.

As to an ordinary water trap, with but two or three inches head of water upon it, preventing the eruption of air from the drains, it needs but a little consideration to see the futility of the supposition. It occurs, then, to us that not these rain-water pipes should be made use of for ventilating the drains, but pipes specially erected for the purpose, in situations where the escape of the air may be above the roof and out of the way of doing mischief.

The ventilation of town drainage seems to be a subject that can only be approached tentatively, and for this reason it is incumbent on every engineer, architect, and builder to say publicly what he has found to be most available in this case. The experiments made by Mr. Bazalgette, and reported by him to the Metropolitan Board of Works, have already been mentioned as agreeing in the main with the conclusions the late Mr. Henry Austin had come to, and they consist essentially of experiments in two methods of ventilation, viz., of charcoal intervened between the sewers and the outer atmosphere, and of free ventilation by pipes carried up to a considerable height above the ground—the charcoal purifiers being placed shortly beneath the surface. These charcoal boxes obstruct the ventilation of the sewers to some extent, and where they are employed the experiments seem to show that it is necessary to increase the number of openings so as to compensate for this obstruction. It is a dangerous thing to confine the air in a sewer where men are at work, for by preventing a free contact with the atmosphere the air in the sewer loses its oxygen to such an extent as to make it unfit to live in; and the increase of carbonic acid gas under the same circumstances increases the danger, but with a greater number of ventilating shafts the difficulty is overcome.

THE PERMANENT WAY OF DIFFERENT COUNTRIES.

To every nation belong its own distinguishing characteristics and its own particular method of carrying into execution the principles of theory and science. Each country regards the adoption of any established system from a point of view most in consonance with its own peculiar ideas and national traits; and although science is universal and principles are absolute, yet between the abstract conception and the practical operation there is abundance of scope for the display of each nation's individuality. It might be supposed that if the different systems of the practical application of a principle could be all referred to one source or origin, they would, instead of exhibiting marked discrepancies, be almost identical. This assumption is completely erroneous. The whole of the railway system, the principles of its construction, even to the minutest details, emanated from our own country. There is a certain similarity or amount of identity possessed in common by all railways, but each is more or less strongly marked by the characteristics of the people to whom it belongs. In some degree these differences are due, not to any distinct efforts of national skill, but to the natural features of the district through which the line passes. The Mont Cenis railway is an example of our meaning, where, owing to the local difficulties to be surmounted, special contrivances were resorted to for the purpose of overcoming them. Manifestly a flat country, similar to Russia, does not demand those appliances and mechanical arrangements necessary in a land like Switzerland, nor does a straight and level piece of line require the aid of the mid-rail to obtain a sufficient amount of haulage power.

During the last ten years the permanent way of railroads has received numerous modifications and alterations, and many principles have been tested with a view to arrive at the best form of rail, the best description of joint, and, in fact, the most eligible arrangement of the *tout ensemble*. The very steep inclines, which it has been impossible to avoid in making lines in mountainous districts, have had a great influence in altering the rail from its original size and weight. The effect of a severe gradient is to tax the two special qualities of a rail to the utmost. It calls forth its capabilities with respect to strength and durability with extreme severity. In ascending steep slopes a certain amount of weight is necessary to obtain adhesion, and in descending them the action of powerful brakes is required to bring the train to rest. Anyone may be convinced of the tremendous wear and tear induced upon the head of the rail by the continued use of the brake by observing how the metals at a station are worn, in comparison with those at some distance from them along the line. About three years of ordinarily heavy traffic will place a rail *hors de combat*, but there are abundance of instances where half this period will suffice, on very heavily worked portions of line, to render them unserviceable. In order to obtain an increased hardness of surface in the rail, combined with greater strength and rigidity, the use of Bessemer steel rails is rapidly spreading, both amongst ourselves and on the continent. Their tenacity is 65 per cent. above that of ordinary iron, and their rigidity and elasticity are commensurately superior, and so soon as the quality can be unmistakably guaranteed, the only objection to their universal employment will be removed. It is the difficulty of ensuring this uniformity in their manufacture that has caused them hitherto to be so high in price. The double requisition of strength and hardness that is to be bestowed upon a rail before it can be considered fit for its duty led engineers to attempt to accomplish the purpose by steeling or case-hardening the upper surface, and also by actually substituting that material for iron in the head of the rail. It is more than two years since this plan was adopted in Austria upon the Sommering line. The contractor's or Vignoles's rail is used there, and the head is of steel, while the flange is of iron. So much success has attended this experiment that the same description of rails has been laid down upon the Brenner line, recently opened for traffic. At the same time, the application of this method of soldering steel and iron must receive a trial upon a more extended scale before it would be prudent to pronounce decisively upon its adoption. Three different kinds of steel may be used for rails, including puddled, cast, and Bessemer steel, each of which is imagined by its special advocates to possess advantages surpassing those of the others.

In Germany the contractor's rail is preferred in general to all others, and is the chief rival of the double-headed form elsewhere. It is true that it is inferior with respect to the rigidity of its attachment to the sleepers, but, taken as a whole, a permanent way consisting of the Vignoles rail laid upon cross sleepers possesses a greater amount of simplicity and fewer individual parts than any other system of road. Both the Great Northern and the Orleans lines in France give the preference to it. As is well known, the Midland and Western Companies adhere, as a rule, to the double-headed rail, which is also much used in England. The bridge rail is used principally upon the Southern railways in Ireland, and also to some small extent in this country. Other systems, embracing the adoption of the Barlow, the single T, together with stones and iron for the supports, have either failed to give satisfaction or been employed upon a scale too limited to entitle them to the appellation of recognised permanent ways. So soon as the weight of a rail becomes augmented, it is equally necessary to increase the number and size of the sleepers, the former desideratum being accomplished by simply placing them nearer together, so as to diminish the span or unsupported bearing of the rail. If we assume, as the average, cross sleepers to be 9ft. in length and 9in. in breadth, and spaced about 2ft. 8in. from centre to centre, the proportion of bearing surface actually obtained per yard run of road will be nearly eight square feet. According to experiments and accurate records kept in Germany, sleepers of uncreosoted or natural oak last, upon the average, fifteen years. By creosoting or impregnating them with other preserving substances they endure for upwards of twenty-two years. From the same authority we learn that creosoted fir sleepers have a duration of about thirteen years, while pine and beech will not last longer than nine. The lighter description of traffic prevailing over the German lines, which have furnished the above results, is the real cause of the sleepers lasting so long. It is needless to remark that upon our heavily worked railways they do not enjoy so long a life, but succumb, in the majority of instances, to wear and tear in about half the time, and in many instances much sooner.

All the varieties of iron permanent way

may be reduced to one of the three following classes:—Firstly, roads carried upon isolated supports; secondly, those supported by transverse bearers; and thirdly, those carried upon continuous or longitudinal supports. Greave's pot sleepers, and Livesey and Edwards' principle, are examples of the first class. They have been attended with a good deal of success in some localities, for which they are specially adapted, and are ultimately destined, applying the remark to iron permanent ways in general, to a wider range of utility. In Egypt, India, Brazil, and other distant countries, pot sleepers have answered well. Continental engineers have not been behind us in turning their attention to the eventual substitution of iron for timber cross sleepers. A Belgian principle, the Mareinelle Couillet, consists of a strong horizontal transverse sleeper of the double tee form, carrying two wooden blocks to serve as supports for the ordinary rail, of whatever shape it may be. Three principal lines in France have afforded a fair trial to iron roads, and selected the Fraisans system, which gives a total weight per yard run, including rails and all fastenings, of a little over two hundredweight. The principle of Leerimer, which in many respects greatly resembles that just quoted, has been laid down for eight years on some of the Portuguese lines, and is still doing good service. In Prussia the Hartwich longitudinal road is employed to some extent. It consists of a pair of heavy contractor's rails, tied by iron transversals, which carry them and rest upon the ground, the flange of the rail having a breadth equal to half that of the height. The same principle has been adopted upon portions of the Lyons railway, only the height of the rail is made equal to that of its base, which in this instance rests upon the ballast similarly to a Barlow rail. The system of Barlow is, in fact, identical with that of an engineer, Bergeron, and so is the iron longitudinal plan that is soon to be practically tried in Austria. At present it is certain that these iron permanent ways, which are based upon the transverse principle, have enjoyed more favour and likewise more success than those modelled after the longitudinal method. The desideratum to be ensured in all rigid roads similar to iron ones is the imparting of some slight degree of elasticity, not as absolutely necessary for the safety of the road, but to diminish the enormous wear and tear that would be otherwise brought both upon the rails themselves, as well as the whole of the rolling stock.

THE ARCHÆOLOGICAL INSTITUTE OF GREAT BRITAIN.

ON Tuesday week the annual meeting of the Royal Archæological Society of Great Britain and Ireland commenced at Lancaster. The principal business of the day consisted in the resignation of the presidency of the society by Lord Talbot de Malahide in favour of Colonel Wilson Patten, M.P. During the afternoon the castle and church were visited, and in the evening a soiree was held at the residence of the mayor.

On Wednesday, at ten o'clock, there was a meeting of the historical section of the institute in the Music Hall, under the presidency of Mr. Beresford Hope, M.P. Lord Talbot de Malahide and other leading members were present. Two papers were read—one on "The Roman Roads of Lancashire and North Cheshire," and the other on "The Recent Excavations at Rome." The paper on Roman roads was by Dr. Robson, of Warriegton, and in the author's absence it was read by Dr. Moore. The Roman roads in Lancashire and the bordering county to the south are not very numerous nor very important—with one exception, that in Chester. Manchester, the writer observed, was probably an early border fortress, and Lancaster seemed to have been something like Manchester, a walled fortress. About the middle of the last century, it appears, an investigation was entered into respecting the Roman roads by several gentlemen—Percival, of Royton; Watson, of Stockport; and Whittaker, of Manchester—but the results were not very satisfactory, and their account of the structure and character of the roads is very imperfect Whittaker asserts that all the roads from Manchester issued from the same gate, some, however, branching off from the original. "The materials of it may be plainly distinguished from the natural gravel of the ground by the bricks and broken millstones which were found incorporated with them. It appeared to be constructed of strong gravel, mingled with large boulders and fragments of rock, and the whole was about 11 yards in width and 1½ yards in depth.

Mr. Barber then read his paper on "The Recent Excavations in Rome." He described the nature of the investigations which have now been proceeding for some time under his directions, the various discoveries which he had made, and also the results of the excavations on the banks of the Tiber, made by the direction of the Pontifical Government. The excavations had disclosed works of historic interest of the first century, which were almost as perfect as though they had only been built ten years. He accounted for the perfect state of their preservation on the supposition that they had been buried immediately after they were built, by a a sudden inundation of the Tiber.

In the afternoon, there was an excursion by rail and carriage to Cartmel Church, an interesting piece of ecclesiastical architecture belonging to the "transitionary period," which is said to be without a rival of its kind in the kingdom. The party were afterwards entertained at luncheon at Holker Hall.

On Thursday a most interesting visit was paid to Furness Abbey, which was described by Mr. E. Sharpe, M.A. By the aid of some admirable drawings and diagrams, Mr. Sharpe explained, first, the general principles in the study of architecture and its division into periods, and the examples of those different periods which were afforded by the ruin before them. Besides the four periods of Gothic architecture—lancet, geometrical, curvilinear, and rectilinear—there was the intermediate period of forty-five years, in which the circular arch and the pointed arch were used indiscriminately, or rather they were used together with discrimination. He believed that the round arch, being found weak for constructional purposes, was abandoned for the pointed arch where strength was required, and used only for decorative purposes. By the aid of other diagrams he showed the different examples of arches, and their dates, thus:—Norman, 1145; Transitional, from 1145 to 1190; Lancet, from 1190 to 1245; Geometrical, from 1245 to 1315; Curvilinear, from 1315 to 1360; and Rectilinear, from 1360 to 1550. Of these six periods they had in Furness Abbey examples of four, which he pointed out as follows:—Of the Transitional period, the entrance gateway, the entire church, with the exception of the choir, tower, and some inserted windows, and the hospitium, all of the date of about 1160; of the Lancet period, the chapter house, the fratery, and the eleemosynary, dated about 1230; of the Geometrical period, the abbot's lodge and chapel and abbot's hall (1300), and the gateway chapel (1306); and of the Rectilinear period, the choir, sacristy, windows of transept and choir (1400), and the west tower (1420). Mr. Sharpe went on to observe that this was one of the earliest abbeys of the Cistercian order, which was founded at the latter end of the eleventh century by the secession of three monks of the Benedictine order, who protested against the worship of saints, the servile prostration of the body, the use of images, and of gaudy colours, gold ornaments, pictures, &c. That secession was, in fact, the beginning of a great reformation, and might be looked back to as the precursor of the Reformation which followed later. He explained the rules of the Cistercian order, and showed how they had been strictly carried out in the erection of Furness Abbey. It was the strict adherence to these regulations that had led him to draw an imaginary plan of the foundations of these ruins, which subsequent excavations, made through the liberality of the Duke of Devonshire, had verified.

On Saturday an excursion was made to Borwick Hall, Levens Hall, Sisergh Hall, and Kendal. Leaving Lancaster by train the party proceeded to Borwick Hall, a fine old building in the Elizabethan style, about ten miles from Lancaster. Mr. E. Sharpe stated that it was supposed to have been built in 1561, and within three-quarters of a mile from it there are the remains of a Roman dock, from which it is inferred that the sea, although now many miles from it, flowed within a mile of the hall during the occupation of this country by the Romans. It is now the property of the Martin family, of Capernwray, and is only partially occupied. It contains, in addition to a fine wainscoted hall and a guard-room, an oratory and a "confessional," of which the railings are still in existence. The principal bedroom is that in which Charles II. slept, in August, 1651, when on his way with his army to Worcester.

Leaving Borwick, the excursionists, who numbered about 150, proceeded to Milnthorpe by train, and from thence by carriage to Levens Hall, the seat of the Hon. Lady Howard. This interesting old building, with its gabled roofs and square headed mullioned windows, is a picturesque mansion of Elizabeth's time, and in the fine hall there are some decided features characteristic of that period The Rev. G. F. Weston, in describing it, said there was abundant evidence that this hall once formed one of the grim peal towers with which the border country was so thickly studded, but that it had since been converted into an Elizabethan mansion. Somewhere about 1500 the building was purchased by one Allan Billington, in whose family it remained till 1699, after which the illustrious name of Howard became connected with the place.

After a short visit to Sisergh Hall, the residence of Miss Agnes Strickland, the well-known authoress, they reached Kendal, where they were conducted over the church by the Rev. Archdeacon Cooper, who read a paper by Mr. Crowther, describing the church. The church is now, and has been for the last twenty years, under restoration.

Mr. Crowther in his paper, after mentioning that the church was dedicated to the Holy Trinity, observed that it possessed the peculiarity of having four aisles co-extensive with the nave and chancel. The entire length east and west was 140ft., and the width 103ft., including an area exceeded by few parish churches in the kingdom. In the course of a discussion which took place a few years ago about the relative size of parish churches, Mr. Beckett Denison made Kendal to be the eighth in area of purely parish churches. It was built in the fifteenth century, ranging from about 1440 to the close of the century. The foundation of an earlier structure on the same site has been found. This church appeared to have been of the Early English period. As far as the details could be ascertained, they had been copied in the restorations which commenced in 1850. There were some Early English fragments in the belfry roof of the tower. The ancient Early English church must have been a structure of great beauty, far exceeding the present church; and so it continued for many years, until the rage for erecting sanctuary chapels set in and led to extensive enlargements and reconstructions of portions of the fabric. The outer walls of the church were first attached, a clerestory built, and the sanctuary chapels attached. These sanctuary chapels were now part of the church, and hence the double aisles. In the eastern column of the south arcade of the chancel was an arched recess, which had been supposed to be a piscina, but research had been made, and no outlet for water could be discovered, and no drain beneath. Mr. Crowther, therefore, came to the conclusion that it was not a piscina, but a credence table. It had been carefully restored. There was no piscina or aumbrey discovered in the east wall of the church. The windows in the clerestory had no reference to the windows or bays below.

The party, after taking refreshment at the townhall at Kendal, returned to Lancaster by train at half past eight o'clock.

The concluding meeting took place in the Shire Hall on Tuesday last. An excursion was afterwards made to Cockersand Abbey, and in the evening a *conversazione* was held.

THE PRINCIPLES AND LIMITATIONS OF GLASS PAINTING.

MR. GAMBIER PARRY, in his report on the Glass Painting in the French International Exhibition of last year, has some excellent remarks on the general principles of the art. The following are the concluding paragraphs of the report:—

"The questions naturally suggested by this Exhibition are—what are the especial principles of glass-painting, and what are its limitations? The art, as it is here presented, ranges over every

possible phase, and, as a whole, it is an abnegation of any principle, and a protest against any limitation. Ought it so to be? Is it so with any other art? All productions of art are properly subject to two restrictions—the nature of their materials and the nature of the human eye. We have now to do with an art which is especially connected with those of architecture and of picture—with the former as an adjunct and ornament, with the latter as a sister art of colour and design. The nature of glass itself differs from anything else that those arts have to do with. Both these arts are based on definite principles and bound by definite limitations. Let a picture be black as night or fresh as morning, severe or sketchy, it will be good only if it have not transgressed the laws of chiaroscuro, of transparent and opaque colours, of colour in relation to light and shade, and of texture in relation to proximity or distance, and of linear and atmospheric perspective. These involve principles that are inviolable, and beyond those limitations no good work ever was or ever can be produced. They are the natural laws of the materials in relation to the eye. The other art, architecture, whether Classic, Gothic, modern, or aught else, has equally its laws and limits. It cannot without ruin transgress the powers of its own materials, nor can it, without offence, violate that science of numbers (the very soul of art, including that of music) which we call proportion. Is, then, glass-painting to be free of all control—the only art let loose in the vanity of unmitigated fancy? A complaint commonly made by glass-painters is that, if their art be tied by old restrictions, they have no opportunity of raising it. They demand freedom for 'high art.' But, on a closer questioning, it is found that few of such complainants have studied general art principles at all extensively; and that, in the detail, knowledge, and drawing of the figure, upon the perfect acquaintance with which 'high art' entirely depends, both their education and practice are still more at fault. The complaint, therefore, resolves itself into little else than impatience of the conditions of the art they profess. Precisely such impatience has led to the chaotic condition of modern architecture. If only they would recognise the dignity of their own beautiful art, and work within the sphere of 'glass' without wandering into that of canvas, and exert their powers in perfect truth of form and in that use of colour which distinguishes a window painter's glass from a picture painter's palette, we should then happily arrive at an art as 'high' as the artist can produce, and one made perfect by being perfectly consistent with itself.

"Pictorial effect is a quality common to sculpture, picture, and glass, though different in each. In the two first it is always regulated by the space it occupies. No figure-painter, no sculptor of alto or basso relievo, would so treat a subject, extending over a series of distinct spaces, as to ignore the forms of the architectural construction which bounded them. Each group would be complete; their connection would be made by the interest of their story. The metopes of the Parthenon, to a certain degree, illustrate this. It is much to be regretted that glass-painters are impatient of this law, which binds all other arts. They also violate the very nature of their own materials in the attempted pictorial effects of atmospheric perspective. These are properly attained only by modulation of colour and loss of outline. Neither of these are properly producible, for modulation is impossible where every piece of glass is of a different tint, and loss of outline is impossible where every piece is held in its place by a black frame of lead. It is answered that these effects are possible, and easily produced by painting in coloured enamels. Let the answer hold good; but we come then to the question of other limits—limits of the right and wrong of human labour, and limits of the duty to human sight. Excessive 'finish' is not a necessary quality of high art; the highest art is that in which the greatest conception is the best expressed. The too high-wrought picture in glass condemns itself by the prodigality of human labour on a material so fragile that the least injury would mar it; and, if the artist were dead or distant, it would be irreparable. It condemns itself also by offering such work as no eye can rest upon to analyse without pain and fatigue. The fault of ambition lies in the pretension of an unjustifiable independence. If the glass-painter be impatient of all limits, whether of architecture or of the special qualities of his own materials, limits, too, of the pleasure, power, or endurance of human sight and the use or abuse of his own labour, let him throw up his art and take to canvas. Then he may labour without stint and satiate the eye without fatigue; but if he is to be a glass-painter, let him honour his own art, and neither borrow the specialities nor wander into the province of another.

"Nature may be prodigal of her ephemeral loveliness, because she can produce the same again to-morrow; but art cannot. If, therefore, there be any right or justice in the principles laid down here and throughout this report, glass-painting must be, as are all other arts, subject to principles and limitations. However high an artist's attainments may be, it will give him room for them. It is an insult to art that all its forms and phases should be forced in one groove or ground to one level. A perfect work of art must be thought out in its own language. A picture-painter rarely designs well for glass, because he cannot think in glass, and he is often a bad judge of works in glass for the like reason—that he is always thinking in his own art-language, and mistakes for good what another art has borrowed and mimicked from his own. Hence it comes to pass that this beautiful art of glass-painting is often misconceived both by artists and by the public. The art, with all its limitations, is large enough to open a field for ever to great genius and study. A man cannot draw too well for it, nor think too poetically; only let him remember into what he has to translate his thoughts—glass, lead and light."

THE BUILDING STONES AND SLATES OF LEICESTERSHIRE.

At the recent show of the Royal Horticultural Society at Leicester a fine collection of specimens of stones, slates, and other building materials found in Leicestershire was exhibited. The collection also served very clearly to illustrate the geological formation of the country. Amongst the specimens of materials exhibited, says the *Gardeners' Chronicle*, was the celebrated Mountsorrel granite, which belongs to the quaternary family, *i.e.*, consisting of quartz, felspar, hornblende, and mica. The large irregular blocks are extensively employed for building churches, chapels, and other public edifices, the small chippings for the macadamisation of roads, and the sifted portion for gravel walks and footpaths, while the fine powder (from the quantity of soda and potash it contains) is admirably adapted as a top dressing for heavy clay soils. The same observations will apply to the sienites of Markfield, the porphyritic green stone of Bardon Hill, and the green stones of Enderby, Huncote, and Croft. The gneiss from Brazil Wood, on Lord Lanesborough's estate, near Swithland, was chiefly interesting from being the only example of this primitive rock found in England, as it does not make its appearance until we reach the Highlands of Scotland. The slates from Swithland and Groby were excellent samples of the hardness and durability of this class of rocks. It is now understood that the whole of the Charnwood rocks belong to the Laurentian system, and, therefore, are among the oldest rocks in the globe. The slates from the Groby pits are said to have been selected by Mr. Gilbert Scott for the basement steps of the Prince Albert Memorial. The beautiful colour of the slate is one of its greatest recommendations, independently of its hardness, which renders it practically imperishable. In the second column are grouped the mountain limestones from Gracedieu and Breedon Hill. These limestones contain a portion of magnesia; the light yellow colour, so different in appearance from the great mountain limestones of Derbyshire, is due to the heating or dolomitization of the material. Succeeding these were the fireclays, coal, and clay ironstone, which form important geological features of the north-west of the county, and furnish employment to vast numbers of the population. Mr. W. Whetstone exhibited excellent specimens of the clay-ironstones and fireclays. These valuable clays are now extensively used for a great number of terra-cotta ornamental purposes, and in the manufacture of coloured tiles for pavements, which, for beauty of design and excellence of manufacture, will bear comparison with any of a similar kind made in Great Britain. Here also were samples of the great new red sandstone formation, which occupies nearly half the surface of the county. Fine samples were exhibited of the "water stones," or Lower Keuper sandstone, lying at the base of this formation. These sandstones are rather soft in character, but are extensively used for building purposes where a cheap stone is required. Of gypsum, of which the county possesses the most extensive deposit found in Great Britain, fine blocks were exhibited. The gypsum is quarried extensively in various parts of the county, and formerly was close to the town of Leicester itself; in fact, it is the gypsum axis that holds up the Spinney Hills, the race-course, and the high ridge of ground extending to the cemetery. Examples were shown of the interesting thin sandstone beds, first discovered in Gloucestershire by Murchison, called the Upper Keuper sandstone. These occur at the Dane Hills, near Leicester, and are chiefly interesting because they were quarried by the Romans for building the ancient town. The important formation of the lias and oolite extending over the remaining half of the county was also illustrated. Messrs. Ellis and Sons showed fine samples of the valuable limestone from Barrow-on-Soar, the special quality of which is its power of setting under water. In these beds the gigantic saurians and other reptilæ exhibited in the Leicester Museum were found. Next came specimens from the middle lias or marl stone, which is extensively used for church building in the eastern part of the county, and is distinguishable by its quantity of fossil shells. Fine samples of this are exhibited by the Duke of Rutland from Waltham and Croxton Park. Of the lower oolite, oolitic ironstone, and great oolite, the lower oolite is principally used for building walls and houses, and for repairing roads. The valuable ironstone band found in this formation and worked so extensively in the adjoining county of Northamptonshire runs down towards Melton, Waltham, and Denton, near Belvoir Castle. All that is required for working this invaluable bed would be a line of railway through the district. The great oolite furnishes a valuable building stone for carved and decorative architecture, and is extensively quarried near Waltham and Ketton.

WHITE LIAS LIMESTONE, WORCESTERSHIRE.

It is always satisfactory to call public attention to an enduring building stone, and such we are informed, on excellent authority, is obtained from the white lias limestone quarries, in Armscott Fields, Tredington, Worcestershire. Professor D. T. Ansted, in his report on this stone, says:—"The white lias of Worcestershire is a variety of argillaceous limestone at the bottom of the lias deposit, well known and easily distinguished from the oolitic limestones, and equally unlike the carboniferous limestone. It has a singularly fine texture and close grain, and is greatly valued for various purposes. It makes admirable ornamental pavements, being tough and polishing easily, with a good face. It is also well fitted for the ornamental parts of houses and public buildings. It is easily cut with the saw or chisel, has few or no hard veins, resists atmospheric action in a remarkable degree, takes a very good polish, and, being very uniform in tint, may be selected with advantage for large works. It possesses the grain and texture of Solenhofen lithographic stone, and might perhaps be available for similar purposes. Its colour is cream, or white. The best quality of white lias limestone is not often found in slabs so large or so thick as in the top bed at Tredington. As a building material it is perhaps unrivalled for the pertinacity with which it resists weather action, and also for its permanent softness. Tombstones made of it are now in Tredington Churchyard more than two hundred years old, which show the lettering as sharp and clear as if it had been done yesterday, and though placed in the most unfavourable position, frost seems to have had no effect in splitting them. It is desirable that the special properties of the Tredington stone should be made known, as they give a real value for many important uses. The toughness and extreme durability, combined with softness and even texture, are due, no doubt, to the large proportion of argillaceous matter the stone contains. This amounts to nearly one-third of its weight."

The above stone was used for the sculpture and ornamental work of the mansion built for E. P. Shirley, Eatington Park, Warwickshire, from the designs of Messrs. Prichard and Seddon, about ten years since, and it is said that the work is as clean and free from weather action now as when produced.

We have seen a specimen of the stone at Mr. Seddon's, and we have no hesitation in saying that it possesses, to all appearance, all the qualities attributed to it by Professor Ansted.

MARC ANTONIO.

IF there is one thing more than another to which we owe the advance that, with all our shortcomings, has undoubtedly been made in most of our manufactures to which fine art is applicable, it is the recurrence from time to time of loan collections of the masterpieces of the art of bygone times. We would call especial attention to the now annual exhibitions of the Burlington Club, which are most valuable. Last year we had a fine display of the works of Rembrandt; this year Marc Antonio is well represented. There are also a few engravings of his scholars and followers, among whom Agostino Veneziano shines out as the principal. The chief contributor is Mr. R. Fisher, to whom also we owe a capital monograph of all that is known respecting the life and works of the great artist from whose engravings we know a good deal of some of those designs of Raphael which have perished. Mr. Fisher is well supported by Mr. Alfred Morrison, the Duc d'Aumale, Lord Foley, Mr. Holford, Mr. Reiss, Mr. Vaughan, and others. The particulars of Marc Antonio Ramondi's life are few and uncertain. 1487 or '88 is given as the date of his birth. This date, as pointed out by Mr. Fisher, is borne out by a probable reading of ÆT. 18 on the copy of Albert Durer's woodcut of "The Adoration of the Magi." He learnt his art first in the School Francia, at Bologna. His first known production was "Pyramus and Thisbe," which is very inferior to his later works, after he had had the advantage of studying Albert Durer, and of having the great Raphael for his master. Of his disagreement with the former artist there is some difference of opinion. All that is certain is that Albert Durer made a complaint to the Venetian Senate that Marc Antonio had plagiarised from his woodcuts. What order the Senate gave with respect to the matter it is almost impossible to determine, though we incline to the opinion that the exact converse of the usual story—viz., that he was ordered not to affix A. Durer's monogram to his copies—is the true state of the case. It is always stated that he did the "Life of our Blessed Lord" first, and that then he was ordered not to affix the monogram. But the fact is that he had not affixed it to the "Life and Passion of Christ," but did to the "Life of the Virgin," so that, if we are right in the priority of the former, it follows probably that the real order was that Marc Antonio, having pirated Albert Durer's designs without acknowledgment, was ordered for the future to affix the  and so not rob the author of the credit due to his compositions. This is rendered more likely by the date upon one of the prints, viz., 1506. Now none of the woodcuts have a previous date to 1509, so that it could not have been copied from any of them, though it might have been subsequently added, not impossibly by Albert Durer's order, to fix the date of his making the drawings. It is more reasonable to suppose that the designs were the point for which protection was granted by the Venetian Senate than the actual woodcuts, firstly, because the copies being on copper could really deceive no one who had seen the originals; and, secondly, because, as is now generally allowed, the woodcuts were not executed by Durer himself. It is true that this is a little hard to believe when we consider the wonderful feeling and freshness of most of the cuts. He probably carefully supervised the work of the celebrated woodcutters Hans Burgmaern, Lucas Cranach, and others, who are believed to have been employed by him, if he did not actually work upon the blocks himself. The effect of Albert Durer's influence over Marc Antonio's style is variously estimated by the two sections who idolise each to the disparagement of the other. Thus, on one side we are told that he owed everything to his study of Albert Durer's designs and mode of engraving, while others would lead us to suppose that the principal influence was that it caused him to forsake the tender delicacy of his first style. There is, however, little doubt as to the enormous advantages he gained from the study and imitation of his great rival. As a copyer we doubt if he ever came up to the originals. The "Virgin with a Butterfly" is doubtless a very fine thing, but it lacks the sharp clearness and spirit of the master's work. The landscape is quite heavy and coarse compared with the beautiful print from which it is copied. There are many more beautifully finished backgrounds than this, which he copied or imitated from Lucas Van Leyden, Albert Durer, and other German artists. Pre-eminent for delicacy of touch throughout are the lovely impressions of the "Adam and Eve." In technical skill Marc Antonio never surpassed and seldom came up to Albert Durer—though he surpassed him in grace and taste generally. His drawing of the human figure was far more beautiful than that of any of the German artists. But in judging of the comparative powers of each we must not forget the vast difference of the opportunities which the one possessed. It was a very different thing to draw from the lovely women of Italy as models and the coarser and seldom handsome women of Germany. Then, again, the Italian had the antique to copy from and chasten his taste by the lovely discipline of the Greek teacher. One of the greatest proofs of the eminence of Marc Antonio is that, though he copied and appropriated right and left, he never lost his own individuality: the vigorous Bolognese feeling is apparent in all his work. But for all that, a comparison between him and Albert Durer, to the disparagement of the latter, is unwise. The two men stand upon quite different ground; with the latter engraving was merely a παρεργον, one among a multitude of excellences. He was equally celebrated as a man of science, a painter, and architect. He also occasionally executed sculpture with his own hands, and in as masterly a manner as he performed all his work. Marc Antonio, on the contrary, was only an engraver, and an engraver to a considerable extent in the sense in which we now understand the word. He engraved always, as far as we know, from the designs of other people; nay, not unusually he copied almost line for line the detail of other engravers, as we have shown above. However much, then, he excelled his great contemporary in elegance, choice of subject, gracefulness of outline, and breadth of expression, and poetical taste and feeling generally, he does not occupy the same exalted position as one of the greatest masters in the world, who, against every possible disadvantage in selection of models, the fashion of his country, the rudeness and coarseness of the life around him, still, single-handed as it were, brought well nigh to perfection an art which was before him quite in its infancy, and which, except in the hands of such a giant, would have required "the progressive concurrence of the exertions of succeeding ability." But really there is no necessity for such invidious comparison; strictly speaking, no fair comparison can be made. The one made the best of his vast natural talents, and the other of his talents and extraordinary opportunities. The earliest engraving of Marc Antonio with a date is the "Pyramus and Thisbe," 1505, the character of which shows that the artist was only a beginner. There is a wonderfully fine print of the "Guitar Player," said to have been a portrait of Achillini, the poet, which has been ascribed to as early a date as 1504, when the artist was only sixteen years of age; but if this print is really the portrait, it is most likely that the date usually given is too early; for though some of the early engravers, especially Lucas Van Leyden, did wonders at an early age, the "Pyramus and Thisbe" shows that Marc Antonio could not have previously executed such a print as the "Guitar Player," although the background is probably copied from some German or Low Country print. The true date, as Mr. Fisher points out, need not be much before 1512, in which year the book "Il Vividario" was published. As soon as he became acquainted with Albert Durer's work, his progress was wonderfully rapid. In 1506 he did the marvellously delicate print of "Apollo and Hyacinthus." In 1509 he did the print called "L'Homme et la femme aux boules," a copy of which, in the finest possible state, is exhibited by the Duc d'Aumale. This print, and the Mars, Venus, and Cupid, of which there were two prints, the second being entirely re-worked, some considerable additions of ornamental detail being added, are among the best proofs of the great influence the great German at this time exercised over his admirer, though without at all destroying his Italian feeling. About this time was executed the beautiful Venus called "Accroupie," and soon after he probably went to Rome, for in 1510 we have the group of figures, "Les Grimpeurs," from Michael Angelo's cartoon of Pisa. The background to this was copied almost line for line from Lucas Van Leyden's print of the "Mouk Sergius killed by Mahomet," but without his neatness. This also applies to the background of Dido—also copied from Lucas Van Leyden—a print which was engraved when the artist was only fourteen years of age. After his residence at Rome and connection with Raphael, Marc Antonio showed his full powers. Among the most beautiful prints of the earlier part of his stay there are Lucretia, from a design by Raphael, and the "Philosophy," from the ceiling of the Signatura Chamber. All these copies from Raphael are most valuable, especially as they were doubtless taken from the drawings, so that we have in them the artist's first ideas, which were often altered in the finished pictures. Some show immense power. The "Madonna lamenting over the Dead Body of Our Saviour" —*La vierge au bras convert*—of which a fine copy belonging to the Duc d'Aumale is exhibited, is a remarkably fine instance. Mr. Holford's impression of the "Plague" (B. 417) is a very beautiful print. One of the most interesting of the Roman pictures is the "Last Supper," from a design by Raphael, of which there is a drawing in the Royal collection at Windsor. This is one of the most impressive representations of the subject that has ever been made. We cannot help regretting that so grand and reverential a description of the sublime scene was not carried out in painting. One of the very finest engravings after the designs of Raphael is "The Murder of the Innocents." Of this, there are two plates, both, apparently, by Marc Antonio, though the one with the chicot is by some supposed not to be his. It is a splendid design splendidly carried out. "The Murder of the Innocents" is the print about which there is a legend that Marc Antonio was murdered for making the second plate by the owner of the first. The legend is, like many anecdotes of great persons, not founded on fact. It is hard to understand how an engraver that could catch the fire of the original artist—as has been the case in this example—could be so tame as in the St. Cecilia (116). We cannot be too thankful for the opportunity offered by the spirited members of the Burlington Club of enjoying the sight of this prince of engravers, more especially for the intimate acquaintance it gives us with the work of his greater master, Raphael. We should like at some future time to see in one room some of the masterpieces of the German school compared with the Italian. Such a comparison would greatly increase the profit and pleasure of the study of the engravings.

We are very glad to hear that it is arranged that under the joint auspices of the old British Institution and the members of the Burlington Club, the annual exhibition of pictures by old masters will be given. It would have been a great loss to us if these instructive loan collections had been abandoned. We have little doubt that, under the joint management of the two societies, they will be better than ever.

INTERNAL DECORATION.

DESIGNS FOR STENCILLING.

THE internal surface decoration of our domestic buildings is a subject well worthy attention and study. As regards the present and popular mode of embellishment I cannot speak very favourably. The usual treatment of a door, for instance, is, after it is well hung and warranted not to break off its hinges (and its stability is frequently its best feature), to paint it a dingy cream colour, being then considered to look very neat. Another way is to paint the aforesaid door two or three coats, and then grain it with a comb, and the result is as artistic as might be expected from such an uncouth instrument. The effect is usually that of a number of miniature pre-Adamite monsters in various painful positions, as if undergoing extreme torture. The last mode (and undoubtedly the best of the three) is to stain and varnish the wood.

Now, I ask, is there any *real* art in either of these three processes? I unhesitatingly assert there is not. Art was never intended to make an object look hideous or even plain. Art is a magic mantle given to man to cover the natural plainness or ugliness of objects, and to make them pleasing to the eye and affecting to the heart. Art is a glorious sunshine, which vivifies all objects. Art, in a word, is the embodiment of everything that is beautiful and true.

And what a glorious privilege it is for a man (however humble and obscure he may be) to be enabled to use his powers for the advancement of art in his country! How dignified is his office! To cultivate his mind by studying the finest works of his forerunners, to study their various styles and the *poetry* of their works, to feel habitually that deep and earnest love of the beautiful, to survey Nature with awe and admiration, to look up to her, to try and grasp the mysteries of her origin, and to endeavour to penetrate into her utmost depths—what can be more delightful to the thoughtful man than such refining and elevating studies?

The man who has, from his earliest years, been accustomed to view objects of truth and beauty will throw to the four winds the hideous monstrosities of too many of the (so-called) artistic productions of the present day. How rare is it that we can find even a decent wall paper! Look at even the more expensive kinds. Truly there is a vast amount of colour and gold, often tawdry enough; but how about the forms? You will see bunches of grapes and leaves shaded to resemble nature; full-length figures, to which even the *artistic* daubs on some of our cheap music are absolute gems; impossible fruits joined to no less impossible leaves and stems; historical subjects, scenes from gipsy life, robbers, hunters, wild, weird looking forest scenes, sunsets, moonlights, and numerous other subjects, all represented in the same detestable manner. Indeed, some of the wall papers I have seen resemble subjects taken from Verdi's fiery opera *Il Trovatore*. Take a wall paper, which is a kind of necessary evil. I hope the time will not be far distant when such a thing will be obsolete (unless the designs improve vastly). How much superior it would be to stucco the walls and then paint really artistic subjects, or else stencil the surface with natural or conventional forms treated *flatly* (for shading is opposed to the true principles of decoration). What can be more beautiful and yet simple than the adaptation of such plants as the ivy, jessamine, wild convolvuli, harebell, coltsfoot, bramble, wild rose, black thorn, white thorn, oak, and numerous others? Take the ivy, for instance. The leaf is simple enough so

but consider a few of its combinations. It may be enclosed in a circle, triangle, square, pentagon, hexagon, and other polygons. It may alternate with large and small leaves, with whole leaves and semi-leaves, and with leaves and buds. Its stems may also be variously curved and ramified. Then, again, the colours may be almost infinitely varied. And the same may be said of the remaining plants. Now, I ask the artistic decorator, does not this give you sufficient variety? Do you ever think you could exhaust the combinations of the few and simple plants I have mentioned? If you cannot do so how, I ask, can any one complain of want of sufficient materials for design? It is not materials for design that we require, but *designers*. What I have said respecting wall papers will apply with almost equal force to carpets, hangings, furniture, &c. It is very true that our ablest architects are turning their attention to these subjects, and very successfully, but the subject wants popularising.

Some people may think that the rage for novelty is the bane of true art. But such, I think, is not the case. Novelty for its own sake may be prejudicial, but if it merely arises from a desire of further improvement in design its tendency is undoubtedly good. Let your novelty-seekers, then, return to nature. Let them go to the nearest stream and thoughtfully study the weeds by its side, and in its bosom. Let them take a microscope, and look for one moment at the world of loveliness therein displayed. Or, let them wander in the sunny lane or shady wood, and look at the materials around them and beneath their feet, which seem to say, "We are nature's children; some of us show ourselves boldly to your gaze, others retire; but take any of us, from the noblest and most richly dyed flower to the humblest weed, and you will be well rewarded."

The "designs for stencilling" which accompany this paper do not require much explanation. They are partly conventional and partly natural. The natural ones are founded on the wild convolvuli, ivy, oak, blackthorn, starwort, and one or two other wild plants. They are intended to be stencilled in bright (though light) colours on a tertiary or negative ground. If the ground is maroon colour, bright green leaves and stems and pink flowers margined with white or green, or white flowers simply *lined* with crimson on green, would perhaps be effective. On a light grey ground the flowers might be either of the primary or secondary colours subdued by white, and margined with white or a complementary colour. The leaves and stems should be complementary to the flowers. On a cream-coloured ground both the flowers and leaves might be a delicate *lilac*, with lines and margins of bright yellow or white. It would much simplify the process if the stencillings were left *unmarginated*. The patterns would gain vigour, but lose delicacy.

The above are only a few of the almost infinite coloured combinations of which the above designs are capable; and it would be a pleasing experiment to stencil or copy the designs in the colours I have enumerated and observe the effect. Probably it might be found that much more effective harmonies of colour could be obtained than the above. The designs might be used for doors, cupboard fronts, skirtings, wood chimneypieces, walls, and modified to wood mouldings. In decorating the mouldings of an architrave, for instance, it would be well to colour the prominent members (as beads) with yellow, white, light blue, or pink, and the hollows with a somewhat negative hue of blue or red; *contrast* will then be obtained, which is a great source of beauty.

Birmingham. John Statham Davis.

LAACH ABBEY.

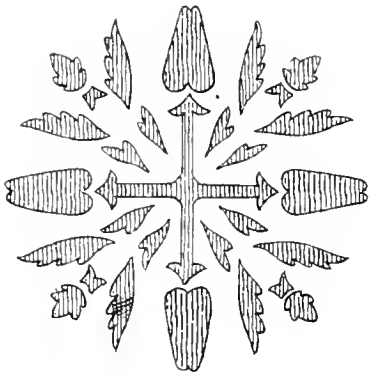
THE Abbey of Laach, the subject of one of our illustrations, is situate about ten miles inland from Andernach, a town on the border of the Rhine. It is said to have been built at the close of the eleventh century, by Henry II., first Count Palatine, on the Rhine, and his wife Adelaide. The site, as usual in those days, was indicated to them in a miraculous manner. The Abbey Church is a pure specimen of the Romanesque style, the semi-circular arch being used throughout, without any admixture of the pointed. It is not very large (215ft. by 62ft. internally, and the highest tower only 140ft. high), but by its completeness of plan and the fine grouping of its towers, it deserves to be ranked amongst the best examples of Rhenish architecture. Compared with the exterior the interior is mean and uninteresting. Externally, the grouping and variety of form of its towers are most pleasing. The principal western tower is square on plan, rising telescope-fashion above an outer casing, which is finished with an open arcaded gallery, and a lean-to roof. It is itself terminated by pediments, and a four-sided spire, with diamond-shaped faces. The circular turrets flanking it are at the cornice formed into octagons on arches springing from corbels, and have low octagonal spires. Over the crux the eastern cupola is covered by a large and well proportioned octagon tower and spire. Its flanking turrets are square, with pyramidal roofs. The continuous eaves line with bold cornice, enriched by cable and billet mouldings, and supported on arched corbel courses, the effective open arcades of the external galleries, with their coupled slender shafts, and the single columns, set in the midst of the wall, to bear the arches of the belfry openings, are conspicuous features of the style. Good Romanesque ornament and grotesque imagery are exhibited in the carving of the capitals of the western doorways and the archways of the parvis. The interior consists of a nave of five bays, each of which, unlike the usual Romanesque arrangement, is vaulted separately in an oblong compartment. Side aisles, with bays corresponding to those in the nave; a circular apse, projecting from the square western tower and transepts, flanked by the two western turrets; a fine western cloister-like porch, enclosing a square court, are of the few examples left of the ancient parvis, from which entrance is obtained into the side aisles. The monastic buildings are all comparatively modern and devoid of interest.

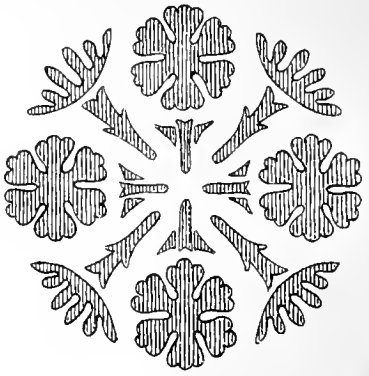
PUBLIC MORTUARIES.

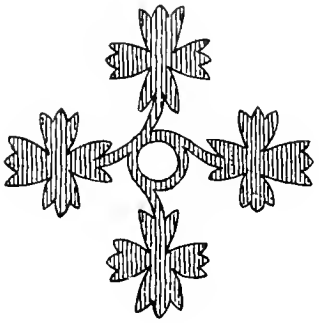
THAT it is not only expedient but absolutely essential to the sanitary welfare of large towns, that public dead-houses should be erected in every parish, is a dictum which a constantly growing public opinion ratifies. The little dingy hovels and sheds now, by courtesy, termed parochial dead "houses," are shamefully inadequate to the requirements of large town populations. The "powers that be" seem to have something like an intuitive perception of the scanty provision made in this respect; for, as a general rule, the dead "houses" are poked away in some of the most inaccessible and out-of-the-way holes and corners that exist. At inquest after inquest jurymen are found complaining of the loathsomeness and repulsiveness of these confined temporary receptacles for the dead, which they, as jurymen, are called upon to visit to "view" the subjects of inquests. The Marylebone and Paddington dead "houses" have each been thus condemned. It is but justice to the vestry of the former parish, however, to state that they have determined to build a new mortuary, providing ampler accommodation, which, if not all that it ought to be, will at any rate be a great improvement. We trust that the lesson thus set will be imitated in other parishes, and be equalled, if not excelled. But what, after all, is required, is the establishment of *public* mortuaries. By "public" we mean not *parochial*—not in anywise connected with the workhouse authorities. Popular prejudice runs high against the "House" and all connected with it, and in no instance is the aversion to parochial assistance so great as in the interment of the dead. It thus constantly happens that while the money with which to pay the undertaker is being earned, borrowed, or collected by means of subscription lists, a corpse is kept for six, seven, or eight days in a room, and that room, be it remembered, at once the living room and sleeping apartment—the parlour, kitchen, and bedroom for sometimes as many as six persons.

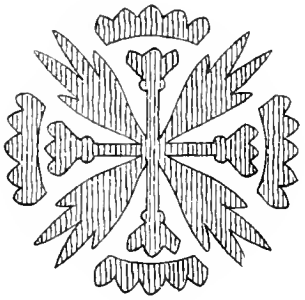
An inquest held at Marylebone workhouse on Tuesday week fully demonstrated the abhorrence with which all things connected with the workhouse are regarded by the poor. The maintenance of this dread of things "porochial" is, we know, a main article in the creed of the school of parochial dignitaries of whom Mr. Bumble is not a very over-caricatured impersonation. But, as has been over and over again demonstrated, it is a penny wise and pound foolish policy, and in certain quarters this is slowly being recognised. At the inquest we have adverted to, it appeared that a man had refused to allow the corpse of a child to be taken to the parochial deadhouse. The description of the man's room and the recital of his objections to have the body removed to the deadhouse were corroborative of what we have written. We hope therefore soon to hear that steps are being taken to provide public mortuaries.

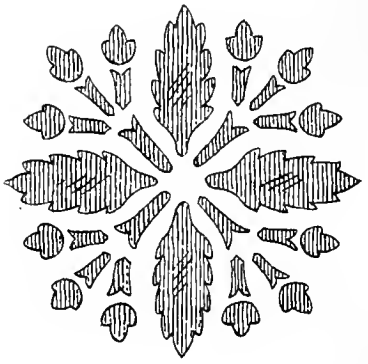
A contemporary has again mooted the question "What is to become of the Surrey Gardens?" Since St. Thomas's Hospital, London Bridge, was demolished to make way for the Charing-cross Railway, the gardens have afforded a temporary retreat for the sick and maimed under the care of the institution, but on the completion of the new hospital at Stangate, in a year or two, the gardens will be vacated. It is suggested that the dwellers of Walworth, Kennington, and Camberwell should take measures for securing the site for the purpose of a public park or recreation ground.

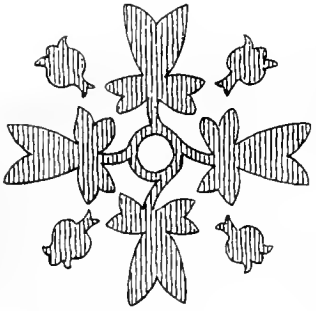


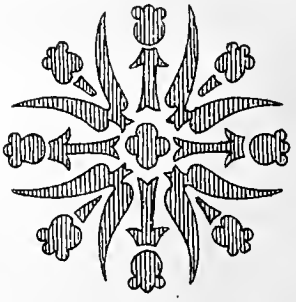


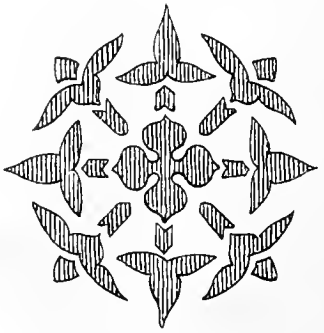


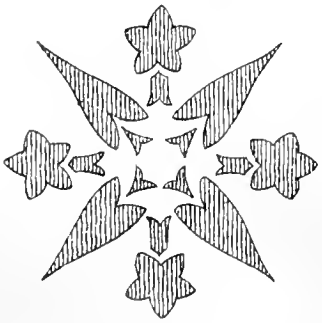






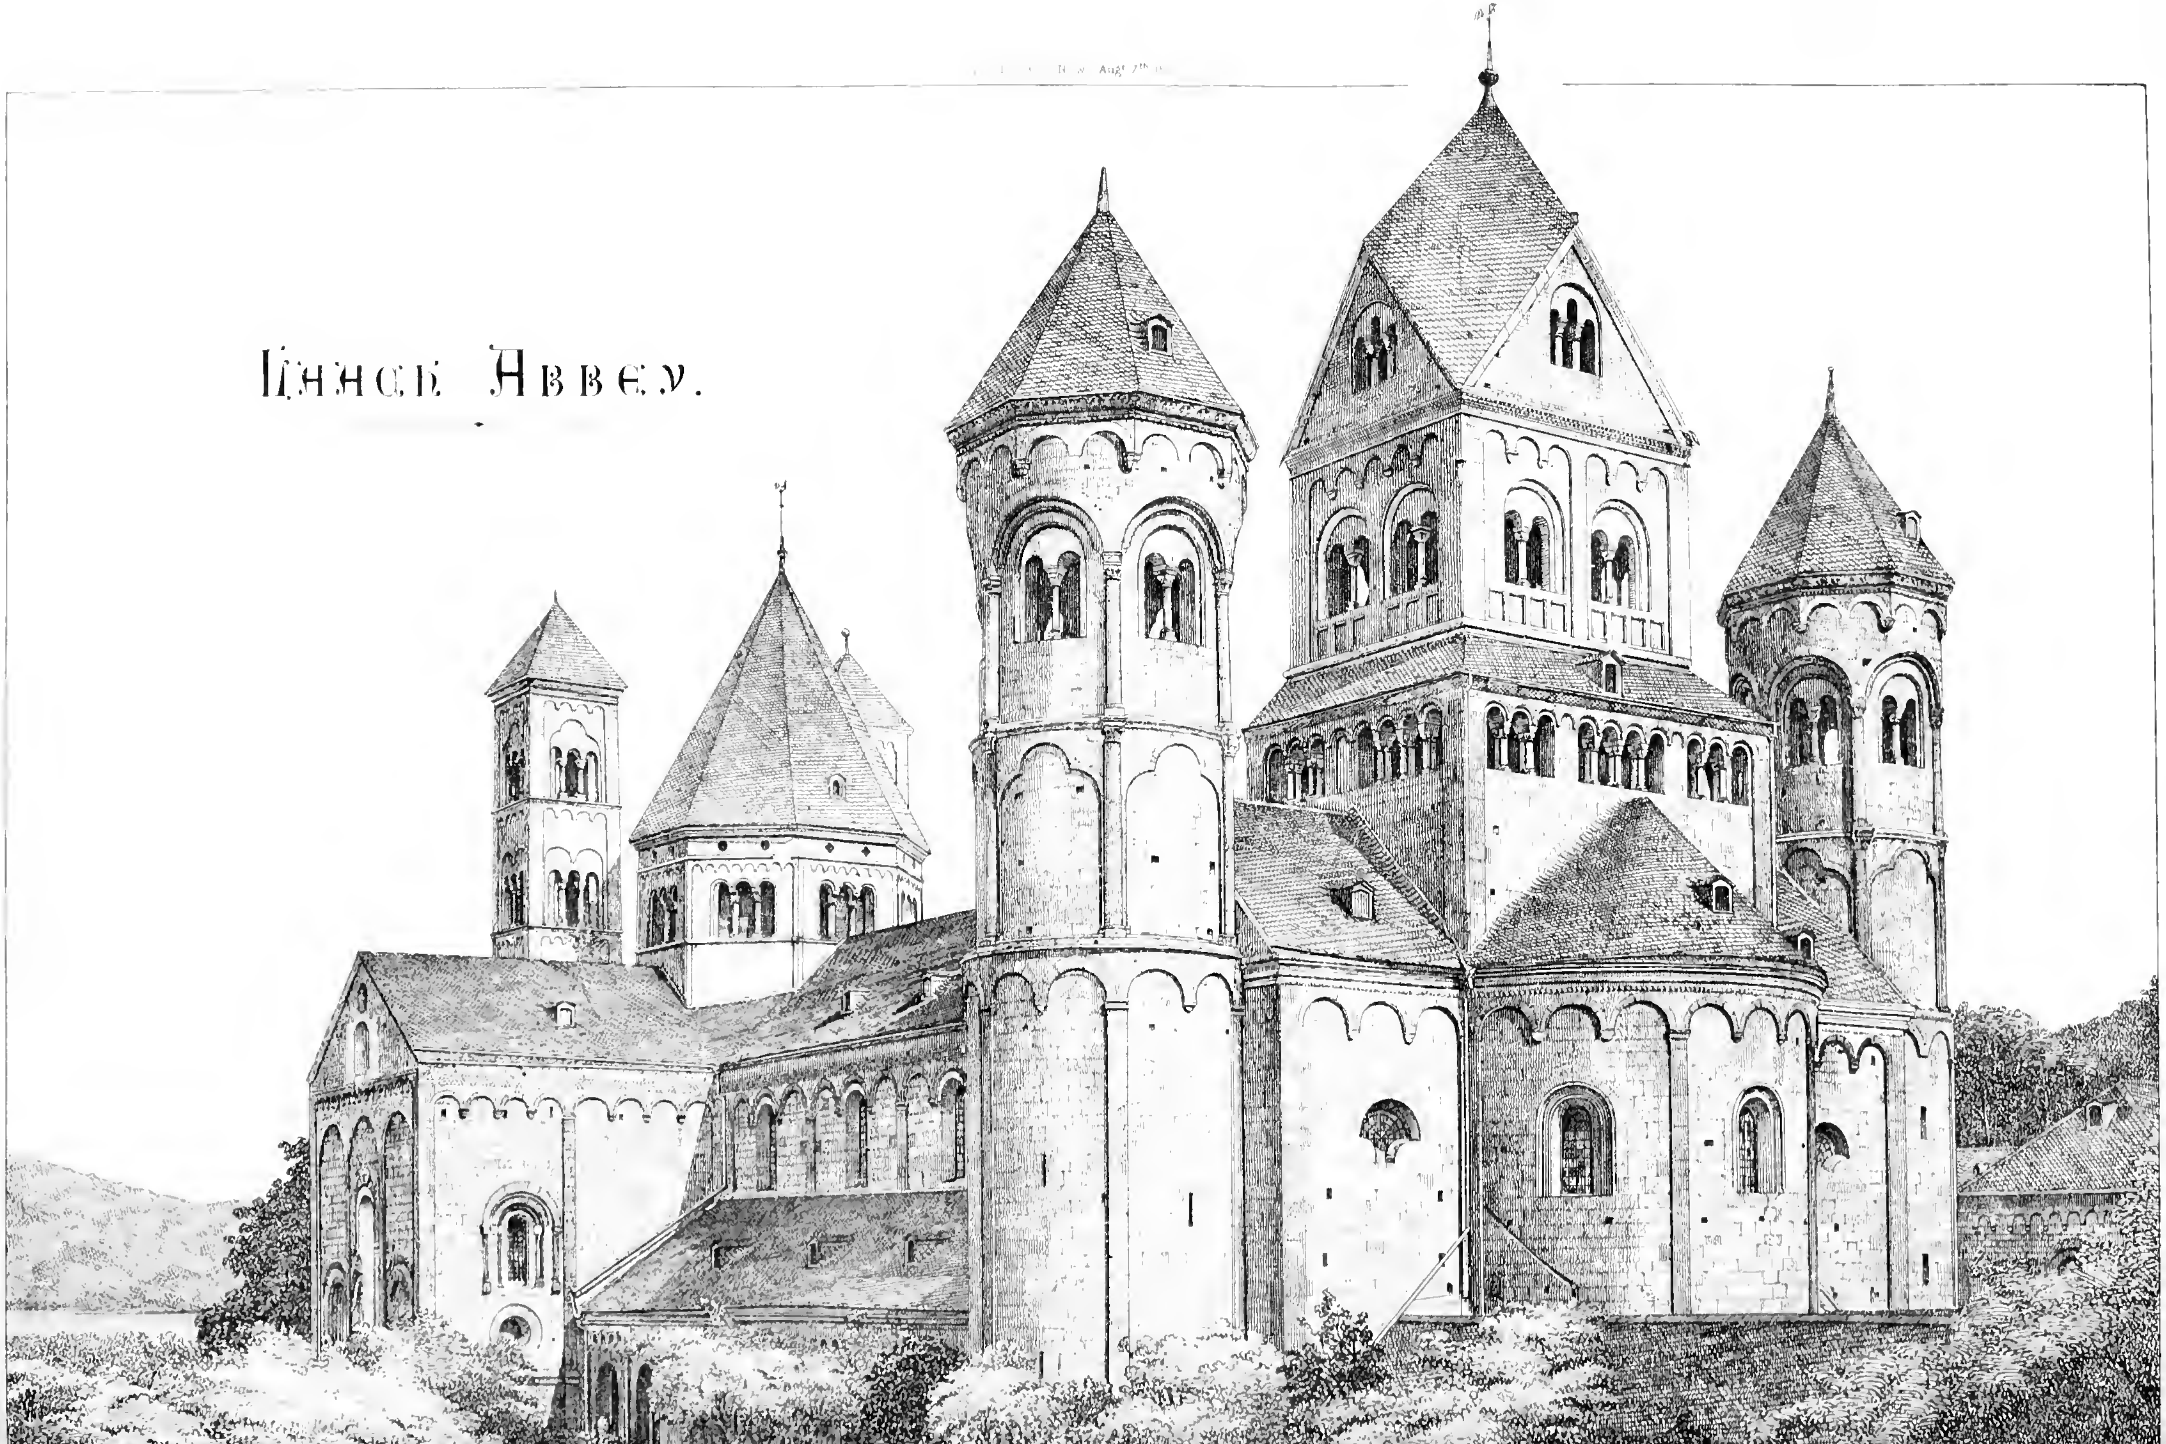






Designs for Stencilling. BY J.S. DAVIS.

Printed by Whiteman & Bass



Laach Abbey.

CO-OPERATIVE BUILDING SOCIETIES.

SLOWLY, yet very surely, the principle of co-operation is advancing among us. The limits of its application seem to widen daily, and a movement which fifty—nay, twenty—years since was stigmatised as socialistic and revolutionary bids fair to create a new era in our commercial history. In the July number, taking as its texts Dr. Begg's book on "Happy Homes for Working Men," and the "Correspondence with Her Majesty's Missions Abroad regarding Industrial Questions and Trades Unions," the *Westminster Review* has an exhaustive article on co-operation applied to the dwellings of the people. The purpose of the writer is to define the influence of an experiment in house building which has changed the aspect of industrial life in Edinburgh, and which may, if rightly applied and honestly worked out, vastly improve the social condition of London and other cities. Past achievements are quoted as examples both at home and abroad.

Twenty years ago—in 1848—the "Association of Masons" was founded in France. It consists at present of eighty-four members, two of whom jointly manage the building and pecuniary departments, a third is assistant manager, two-thirds of the remaining 81 members labour with the hod and trowel, and the others are superintendents and distributors of work, or merely holders of capital. This society is now officially pronounced to be in a "remarkably prosperous" condition. In 1852 the business done amounted in value to £1,800, from which a profit was derived of £40, in 1858 the value of the business executed was £48,700 and the profit £8,000; a dividend being paid in that year of 56 per cent. Some of the finest mansions in Paris have been built by this company, and last year it contracted to build a new station in Paris for the Orleans railway at an estimated cost of 2,000,000 francs.

At Mulhouse, a little manufacturing town on the south-west frontier of France, we find the same principle worked out differently. In 1835, of the 17,000 workmen employed in the cotton factories nearly one-third had to lodge themselves as best they could in the adjacent villages, five and six miles distant from their work, and that when a working day consisted of fifteen hours, commencing at five a.m. and terminating at eight a.m. all the year round, summer and winter. To avoid the exhaustion consequent on these long walks, the operatives herded together in the most hideous hovels within the town—two and three families crowding in a room of very limited dimensions. So things continued for years, the employers amassing wealth, but adding nothing to the comfort of those employed. At length, in 1851, instigated by the sight of the model lodging-house exhibited by Prince Albert in that year, four small houses were built by M. Jean Dollfus, at the village of Dornach. These proved so successful that a company was formed with a capital of £12,000, in sixty shares of £200 each. To this the Government added £6,000; and in the following year the capital was augmented by eleven additional shares of £200 each, and by a second grant from the Government of £6,000. As the event proved, and as will always be found to be the case where men are self-dependent, the government aid could easily have been dispensed with. The results that have been achieved by this company now render the working men of Mulhouse as much objects of envy as they formerly were of compassion. In ten years the "Société des Cités Ouvrières" has built 692 houses, besides public baths, laundries, bakery, fountains, and gardens. Not only, too, have they benefited themselves, but their example has compelled house proprietors in general to pay more attention to the comfort and welfare of their tenants.

"A Cité Ouvrière," says M. Vernon, "is one of the most pleasant sights in the world. The streets intersect each other at right angles, are macadamised, and lighted with gas, those which run the length of the *cité* being nearly 28ft. wide, and the cross streets between 17ft. and 18ft. wide. Each group of houses, either two or four in number, is surrounded by a small garden, carefully cultivated and well stocked. Each house occupies about 45 square yards, and each garden three times that space. Generally the houses are one story high, though a fair proportion are of two stories." Nearly every house is the property of the occupant, and upon this seems to have turned the success of the scheme. A simple plan was adopted by which this was effected. The average cost price of each house was from £120 to £160. An immediate payment, therefore, was required of £10 or £12, and the balance was to be liquidated by monthly instalments, so that in thirteen years the occupant could become possessed of a house worth by that time double the amount he had paid for it.

We now look at home. In 1861, a serious dispute occurred in the Edinburgh building trades. A three months' strike was the result, which ended in the victory of the men. During the contest it had often been represented to the men that the money paid weekly to each man for upholding the common cause might, while maintaining a just struggle, have provided for themselves properly constructed houses, and effected a desirable social reform. The examples of English and French workmen in other departments were adduced, and the Edinburgh workmen were earnestly urged to apply this new power for the production of suitable dwellings for themselves. Their interest was at length aroused, and a spirit of inquiry was engendered that soon bore fruit.

One evening, in the month of April, 1861, six or seven masons met together in a dingy room for a long and anxious consultation. They fully realised the necessity of doing something; they plainly saw that for commercial purposes builders would not invest in workmen's houses, and, scorning to trust to charity, those half-dozen brave humble men parted from each other in faith, to meet a few days hence with clearer insight and firmer resolve, determined, with the assistance of their fellows, to try a new experiment in co-operative enterprise. At a not very largely attended meeting of masons, held April 17, 1861, a co-operative building company was formed, with a capital of £10,000, in shares of £1 each. The amount actually subscribed at first was £25. By 1865, all the shares were taken up, and the number of members is now 836. The working capital has been turned over ten or twelve times, at an average of 15 per cent., and the process goes on and may go on indefinitely. About 400 houses, providing good accommodation for 2,000 individuals, have been built and sold for £70,000. As a commercial undertaking, viewed altogether apart from its high moral and social influence, the Edinburgh Co-operative Building Company is a signal success.

These examples prove that the co-operation principle does not depend for success merely on local circumstances or national characteristics. Honesty of purpose, steady application, and an ordinary amount of business-like management are sufficient to ensure success; and the great merit of the principle is, that its very practice inculcates all these good qualities. When men manage their own property, the inducement to be dishonest ceases. None but a lazy workman will idle at a job, and working men are far more business-like than many people suppose. One thing is certain; at present there are no instances of gigantic fraud or shameful mismanagement to warn off intending investors. Can the same be said of the more purely middle class trade societies—insurance companies, railway companies, banking corporations, and the like? This is a point too often lost sight of.

The Artisans' and Labourers' Dwellings' Bill, which has lately received the assent of Parliament, affords striking proof of the difficulties which stand in the way of providing better house accommodation for the working classes of London. But it is only partial relief that will be derived from this or any other similar measure. Legislation is practically powerless, except to remove condemned uninhabitable dwellings, and to make possible the obtainment of building sites in suitable parts of the town. Let working men, however, once be taught that they can build and buy their own houses, at the same time providing work for themselves and bread for their families, and all Government aid can be dispensed with. A spirit of manly self-reliance will prevail, and the practical observance of the proverb that "God helps those who help themselves" will do more to fit the lower classes for the exercise of their rights as fellow men and citizens than all the pseudo-philanthropy of feeble-minded patrons, or yards of sedition from the pens of blatant demagogues.

GARDENS.

FRANCIS, Lord Bacon, philosopher, statesman, and lawyer, in his "Counsels Civil and Moral," has an essay on gardens, and this fact has caused much wonderment on the part of shallow-brained folks, who cannot comprehend what gardens have to do with things civil and moral. Its place amongst moral themes is justified by its first few lines. A garden was first planted by God Almighty, "and, indeed," says Bacon, "it is the purest of human pleasures; it is the greatest refreshment to the spirits of man, without which buildings and palaces are but gross handiworks." And yet, on the whole, people do not justly appreciate this purest of human pleasures. Nor will they do so whilst a Schneider or a Finette is idolised by them. The gardens at Sydenham attract a far less number of visitors than a Blondin, a prince, or a general. At the same time, says the *Pall Mall Gazette*, people who really plume themselves on their passion for gardens are constantly found not to know what a garden is; and to believe that a passion for gardens means a passion for acres of glass with countless flower-pots and endless supplies of heated air underneath. Horticulture is a misnomer for vitriculture. The glass-house did not enter into Bacon's conception of a garden, though he asked for thirty acres of space. But in his time the measure of refreshment of spirit which men could get out of a garden or a house was not simply the amount of money which could be put into it.

Gardening on a large scale is costly in the labour which it requires, even if land were cheap. Ample "health and sweetness" may be obtained in smaller plots than thirty acres, provided your garden be not surrounded by brick walls. Still, there are some charming old gardens in the Twickenham and Hampton country, though mostly as rigidly enclosed within four walls as a parlour or sleeping-room. Such gardens are in the nature of apartments, and very pleasant chambers they are. In the suburbs of great cities the little square spot at the back is not a garden in the sense which Hampton Court Palace or Kensington has gardens, but it is an open chamber in which a man and his wife may delude themselves most agreeably and profitably into the notion that they survey the loveliness of nature and the marvels of creation. And there is not nearly so much illusion here as in the costlier delights of more ambitious folk. Still, narrow and walled spaces, with flowers and strips of turf and gravel, are not gardens in the truest sense. For these space is essential. To acquire for a garden all that a Bacon could desire, the one thing needful is to plant it on a height overlooking a spreading weald or a pleasant valley, or to place it in a prospect of distant hills and downs. In such position it matters not whether the garden be thirty acres or half an acre. If rightly placed, a garden, to be full of delight, need be no more than a broad and ample piece of well-kept lawn, with flower borders and fragrant hedges. All that you want is a soft and pleasant carpet for the feet, little pieces of bright colour for the eye, gracious prospects, and the perfume of honeysuckle, thyme, and the like. There must also be a sheltered gravelled walk for winter days and nights. But it is a vile blunder to cut a garden up with gravel walks which are pleasant to no sense, and which in ninety-nine

cases out of a hundred are too narrow for three persons to walk abreast. A couple of narrow strips are unaccountably preferred to one broad alley. It is hardly a less blunder to take up space with craftily-devised flower-beds, of many cunning combinations of form and colour. As Bacon says, "you may see as good sights many times in tarts." The main point in a garden, if it is to be for the great refreshment of the spirit of man, is simplicity. The simpler it is the fewer chances are there of its getting out of order, and so disturbing the eye and mind of its possessor.

BUILDERS' BENEVOLENT INSTITUTION.

THE twenty-first annual general meeting of the friends of this charity was held on the 30th ult., at Willis's Rooms, St. James's, Mr. W. R. Rogers, President, in the chair. From the report read by Mr. Bird, the secretary, it appeared that the subscriptions and donations had increased during the past year. Four pensioners had been elected, two males and two females, from a total of seventeen candidates. One death had taken place. The number of pensioners is now forty-eight—twenty-four men and twenty-four women. A satisfactory addition has been made to the funded stock, £1,525 19s. 3d. having been purchased for the Relief Fund, and £107 8s. for the Building Fund. The amounts now invested are £11,332 19s. 4d. stock for Relief Fund, and £2,939 19s. 9d. for the Building Fund, being a total of £14,272 19s. 1d. The report was unanimously adopted. On the motion of Mr. George Plucknett, the thanks of the meeting were given to the patrons of the institution, and the names of the following gentlemen, who had each contributed a donation of £100, were added to their number:—"A. Z." (per Mr. George Dines), Messrs. W. Webster, John Kelk, M.P., C. J. Freake, Lucas Brothers, Lawrence Brothers, Holland and Hannen, W. Cubitt and Co., G. Myers and Sons, and G. Smith and Co. A vote of thanks was next given to the retiring president (Mr. W. R. Rogers) for his services to the institution, especially in obtaining the above ten donations. The various officers having been elected (Mr. George F. Trollope being the new president), the proceedings terminated.

KENT ARCHÆOLOGICAL SOCIETY.

ON Thursday week one of the most successful annual meetings of the Kent Archæological Society was inaugurated at Canterbury. After the usual business, Professor Willis gave a lecture on the ancient monastery of Christ Church, which formerly surrounded the cathedral. Professor Willis said he had been enabled to satisfactorily decide on the uses of many buildings which hitherto, on less complete investigation, had been assigned to purposes for which they were not intended. For instance, what was called the Baptistery was, in fact, the great tower to which water was introduced from the north side, and from which the various lavatories of the monks were supplied. By reference to that remarkable and interesting work "The Rites of Durham," which was written by one of the monks, and which contained a minute description of the whole routine of their daily lives, the whole plan was rendered plain and comprehensible. There were the carefully contrived passages by which the holy fathers could pass to their diurnal and nocturnal services in the cathedral dryshod, carpets and wood flooring being unknown in those times; there were "the studious cloisters pale," where the more educated pored over ancient manuscripts or instructed the novices, or where the less instructed could think over their past faults and repeat their "Ave Marias" and "Paternosters." For these purposes the south alley of the cloisters was always enclosed, while the other three sides were generally left open. In his researches he had been able to make out quite distinctly the four hostels which were always provided for guests in large houses of this kind. The one for the ecclesiastics was at the east end of the cathedral, and near it, on the north side, that of the nobles, both being close to the more holy parts of the monastic pile. The question hall, for the middle classes, the merchants, and well-to-do, was at a considerable distance; while that of the pauper class was close by the entrance, and as far off as possible not only from the holier portions of the building, but from the other classes of society. The ecclesiastics and nobles were all under the care of the prior in this case, or the abbot at other places, while the middle class and poor had each officers appointed respectively to take care of them. Professor Willis then, by means of drawings laid before the audience, explained all the details of the ground plan which he had prepared, and, accompanying the members over the Cathedral Close, pointed out the particular localities of the building he had described.

On Friday morning, after Divine service at the cathedral, a large party met at St. Augustine's College, over which they were conducted by the Rev. the Warden. The members then went to the ancient church of St. Martin, founded by Queen Bertha or Ethelburga, the wife of Ethelbert, King of Kent. On the left side of the altar in this church, looking towards the east, is a tomb said to be that of Bertha, the Royal foundress, and it has several other extremely ancient memorials of those long past times. The font, although very old, is rather Norman than Saxon, and its ornamentation is of a very interesting character. Next they proceeded by way of the Dane John, along the city walls, and by the ancient mound to the ruins of the Norman Castle, near the gas works; thence to the hospital for poor priests, now the police station; and thence across the river to the refectory of the Grey Friars, built over another branch of the Stour, and to Eastbridge Hospital on King's Bridge. After evening service at the cathedral, the party was conducted over the sacred edifice by the dean, the inspection having special reference to the visit of Erasmus.

ST. PAUL'S CATHEDRAL.

WE have so often had reason to call attention to the neglect displayed by the authorities who have the care of our great cathedral that it is doubly pleasant to be able to record a change for the better. We alluded last week to a spirited attempt on the part of the priests and churchwardens of the Church of SS. Augustine and Faith to restore the churchyard to something like respectability. This attempt has been preceded by a very desirable reform in the interior of the building. The statues have been all washed or dusted. The outstretched arms and legs of the various angels and heroes no longer appear as if enveloped in dark-coloured sleeves and stockings. It is to be hoped that this is but the commencement of a general reform. The official authorities, however, are not entitled to all the blame for past neglect. To preserve the vast pile in anything like order funds are required, and we regret to learn that the means at their disposal are by no means ample. The "Fabric Fund" of the cathedral only amounts to £1,200 a year. Out of this, £240 is paid for fire insurance, and only £960 is left to keep up the inside and outside of the building. Let it be remembered that there are no less than 8,500 square feet of leadwork and 450,000 square feet of out side stone to be looked after and preserved. All of this material is exposed to the influence of our damp climate, and the leadwork especially needs constant reparation. It is impossible to do much with such limited means. Surely, however, the merchants of London need only to be asked to contribute liberally to their augmentation. Let the promoters of the scheme already started form an energetic committee, and accomplish a little vigorous canvassing, and we believe a handsome subscription list will be the result, and this great temple may assume its proper position as at once the greatest glory of our architecture and our Faith.

NATIONAL WEALTH AND NATIONAL EDUCATION.

THE following is the substance of a lecture delivered before the London Association of Schoolmistresses by Dr. W. B. Hodgson. The lecturer said:—There are two prevalent misconceptions respecting political economy,—the science which treats of the production, exchange, and distribution of wealth. The first consists in supposing that it is a purely abstract science, that it ignores the individual man, and looks wholly at general results. The second, strangely enough, is the very reverse of the first. It consists in supposing that economic science teaches individuals how they may most rapidly enrich themselves without regard to the rights of others. Political economy does not concern itself with the enrichment of the community at the expense of individuals who make up that community, nor does it aim at enriching the individual apart from the community to which he belongs. But it seeks to unite the interests of the individual and the community—to enrich the community through individuals, to enrich individuals for the sake of the community. By blending the individual and the general welfare it directs, exalts, and restrains the individual desire of gain; gives to personal effort a higher than personal aim, and shows that general well-being consists in the well-being of individuals. Social prosperity is the result of human acts, of human conduct—human conduct depends on character, and condition depends on both conduct and character. To ensure these the young must be taught and trained,—taught those economic principles which underlie, pervade, or dominate all transactions, and which together go far to make up that which we call civilisation. This teaching involves the study of the various relations of men to men, as producers and consumers, buyers and sellers, receivers and payers of wages, capitalists and labourers, borrowers and lenders, and much besides. By such teaching and training our young people will enter on life able and ready to adapt themselves to the system of things in which they are to take their place, and through which they are to work their way to personal independence and social usefulness.

ANCIENT ECCLESIASTICAL BRICKWORK IN ESSEX.

AT the recent meeting of the Essex Archæological Society, a paper on East Horndon Church (a peculiar structure, built externally of red brick, the principal features in the interior being the splendid mortuary chapels that remain), written by the Rev. E. L. Cutts, was read by Mr. King.

The county of Essex is rich in ancient brickwork. In the buildings at Colchester the most extensive specimens of Roman materials, used up by mediæval builders, are to be found, and St. Botolph's Priory has the most elaborate and successful of these examples. In Coggeshall Abbey is the earliest example of the mediæval manufacture and use of moulded brick. There are many other examples of more or less importance—for instance, the Saxon tower of Holy Trinity, Colchester; the Norman tower, Great Tey; the Early English Chapel in the Spital, Maldon; the Decorated quatrefoil in Lawford Church; and a few bricks are to be found used as rubble in a very large number of the Essex churches. It was not till the latter part of the fourteenth century that brick came into really common use in England, and was then introduced from the Low Countries. Essex possesses an unusually large number of examples of brickwork of this period in ecclesiastical architecture—Ingatestone, Billericay, Mountnessing, Rayleigh Porch, besides Faulkbourn Hall, Beckenham Hall, &c. East Horndon is one of the series of brick churches. Mr. King's researches into the wills of the Tyrell family enable him to fix the dates of various portions of this church. The tower is not so good in proportion as others, and we miss the ornamentation of parapet, &c., which is characteristic of the style. Some of these features will, however, be found in the small mortuary chapel on the north of the chancel. The features of especial interest are the two chapels, one on each side of the nave at its east end. These seem to have been chantry chapels, each with a living-room over it for the chantry priest. The one on the north shows the original staircase, and the one on the south has traces of the original fireplace. The altar tomb, which stood in the middle of the mortuary chapel on the north side of the chancel, was removed by the present rector, and the brass is hung on the wall; and it would be well if one result of the visit of the Essex Archæological Society was the restoration of the brass and inscription to their proper place on the slab, which now forms part of the flooring of the chapel.

THE STRENGTH OF CAST IRON.

MR. HODGKINSON was the first to notice that the behaviour of cast iron under extension differs from that presented by wrought iron. It has been already stated that practically the extension or elongation of a wrought-iron bar is in proportion to the weight or force tending to stretch it. This ratio does not hold in the case of a cast-iron bar, which, instead of being elongated the 1-10000th part of its length for every ton of strain per square inch, is stretched to

double this amount, or the 1-5000th part, and moreover does not obey the law as the magnitude of the strain is increased. Judging from the different internal structure of the two materials, one is at first inclined to consider the elongation of cast iron as somewhat paradoxical—to be surprised that it should be double that of wrought iron for the same strain and sectional area. A little reflection will point out that this proceeds from confounding the immediate effect of the strain upon the iron with that which it produces when the breaking weight is reached. Thus, although cast iron extends twice the amount of wrought with a given strain, yet its ultimate tensile strength is barely a third of that of the latter material. Briefly, cast iron may be said to extend too quickly—too much at a time, and consequently its ultimate powers of tensile resistance are very soon arrived at. Wrought iron, on the contrary, is not affected so rapidly or to the same extent, and is enabled to bear in consequence a greater strain before its resisting capabilities are overcome.

Although of little value for resisting strains of tension, cast iron compensates for its weakness in that particular by the enormous strength it possesses against those of a compressive nature. Were it not for other disadvantages connected with its use, this circumstance alone would ensure its adoption in every instance where strains of compression were to be resisted. Its treacherous nature has, however, put almost a ban upon its application to structures of any magnitude, particularly where its failure might be attended with risk to human life. Within certain limits, and when a form suitable for resisting compressive strains is bestowed upon it, there is no danger in employing it, and we continually witness instances where wrought iron is substituted for it at a great sacrifice of simplicity and economy. The crushing weight, or the ultimate resistance of cast iron to compression, may be taken at fifty tons per square inch of sectional area, and the general conditions permitting this constant to be employed in all calculations are that the strength is directly proportional to the sectional area, and independent of the length, provided the rod, bar, or whatever example may be selected, is perfectly secure against flexure. It will be seen hereafter that in long pillars these conditions do not hold, owing to the tendency they have to deflect, which produces an incipient degree of weakness. Long pillars, in addition to the direct compressive strain brought upon them, are also acted upon by one of a transverse nature. In any example of cast iron which is either too short to bend, or is secured from flexure by proper means, the crushing weight in tons is found by multiplying its sectional area in inches by fifty. Moreover, since the area of a round rod is proportional to the square of its diameter, the following short practical rule will give the breaking weight in tons:—Multiply the square of the diameter by the constant, 39. This rule gives a result rather less than the theoretical crushing weight, and consequently is upon the safe side. If we adopt the same proportion for the ratio of the working to the crushing load of cast iron that we have selected in our other instances, it ought to carry safely 12½ tons per square inch; but for many reasons it would be very injudicious to place more than eight tons upon a material so unreliable, particularly if it is likely, in addition to the load, to undergo any vibration or sudden shock. We may now tabulate the results hitherto arrived at. Tensile strength of wrought iron, 22 tons per square inch, and safe working load, 5 tons; compressive strength of wrought iron, 18 tons per square inch, and safe working strain, 4·5 tons; tensile strength of cast iron, 7·5 tons, and safe load, 1·5 tons per square inch; compressive strength of cast iron, 50 tons per square inch, and safe load, 8 tons.—*The Engineer.*

ARCHÆOLOGY.

AN important discovery has just been made of two Roman edifices at Héricourt-en-Caux, near Yvetot. There is in that district a well-known spring, called La Fontaine de St. Mellon, which, for many centuries past, has been a favourite place of pilgrimage. St. Mellon was the first bishop of Rouen, and, according to popular tradition, baptised the first Christians of these parts at the spring alluded to.

The Wiltshire Archæological and Natural History Society, at its meeting at Hungerford last year, decided upon Chippenham as the *locale* of its meeting this year; but on account of the British Archæological Association being about to hold its annual meeting on the borders of North Wiltshire (making Cirencester its headquarters), the Wiltshire Society has deferred its meeting at Chippenham until next year.

Simultaneously with the meeting of the British Association at Norwich, there is to be a gathering in the same city of the International Congress of Pre-historic Archæology for the promotion of their favourite science.

WATER SUPPLY AND SANITARY MATTERS.

ON Saturday, Colonel Sir William Denison and Dr. E. Frankland had an interview with the mayor and corporation of Preston relative to the river Ribble. The Commissioners left a number of questions for the purpose of their being answered, and intimated that on a future occasion they would re-visit the town and take evidence.

At the last meeting of the Lambeth Vestry letters were read from the Southwark and Vauxhall and the Lambeth Water Companies intimating that certain of the poorer localities in the parish would for the future have a Sunday supply of water.

Building Intelligence.

CHURCHES AND CHAPELS.

The new chapel of ease at Eddington, near Hungerford, dedicated to the Saviour, has been consecrated by the bishop of the diocese. It is erected in the Gothic style of architecture from the design of Mr. A. W. Blomfield, of London, the material being coloured brick with Bath stone dressings. The cost of the work is £2,220.

The church dedicated to St. Thomas-à-Becket, at Lapford, is now in course of restoration. It is supposed to have been founded about the year 1288, though certain parts of the buildings show traces of restoration at a much later date. The whole restoration of the building will cost about £1,800.

The restoration of the parish church at Montgomery is now completed. The west window, a very fine example of Perpendicular work, has been removed, in consequence of its very dilapidated condition, and replaced by new work in exact *fac simile* of the original. The whole of the work has been carried out by Mr. Morgan, of Llandinam, from the designs of Mr. E. Haycock, of Shrewsbury.

A new Roman Catholic Church, dedicated to SS. Joseph and Francis Xavier, was opened on Tuesday week, at Richmond, near Leeds, by the Archbishop of Westminster. The style is Early Decorated, and the plan consists of nave, two aisles, and an apsidal chancel. It seats about 500 persons, at a cost of £3,000. Mr. George Goldie was the architect.

The work of restoring the Cathedral of Nôtre Dame, at Paris, begun twenty years ago, is now being completed by fixing a railing all round it for protection from injury. This is the last operation of the whole of the work undertaken.

On the 28th ult. the Archbishop of York opened the new church of St. John the Baptist at East Acklam. The style is Early English, and the plan comprises nave, chancel, and western tower. Accommodation is provided for 200 persons, at a cost of £1,250. Messrs. J. W. and B. Atkinson, of York, were the architects.

St. Swithin's Church, Cannon-street, is now closed for repairs and alterations. The inside is to be entirely remodelled. The large oaken pews are to be removed, and open seats are to be put in their stead. When reopened the congregation will face the east, and not as they formerly sat, looking in nearly every direction. The pulpit in the church of St. Swithin is one of the finest in the city of London, and was in use long before the fire of London. The old "stone," as we stated some time since, will be specially cared for, as it will be surrounded by an ornamental iron railing.

The foundation stone of St. Mary's Church, Lichfield, was laid on Thursday week. Mr. James Fowler, of Louth, is the architect, and Messrs. Crutchlow and Ward, of Uttoxeter, are the builders. The style is Geometric Decorated Gothic. It will consist of a nave 70ft. long, with north and south aisles, with a chancel 30ft. long, and will seat between 800 and 900 persons.

On the 30th ult., the foundation stone of a new church was laid at the village of Windsor, near Liverpool. The style of the church is twelfth century Gothic, and the plan consists of nave and aisle, with apsidal chancel. It will seat 750 persons, at a cost of £3,600. Mr. D. Walker, of Liverpool, is the architect, and Mr. W. Murphy the contractor.

Castleford Church (Yorkshire) was reopened yesterday week, after thorough restoration. The building, which was on the site of an older one, erected in the twelfth century, was so dilapidated as to require almost rebuilding. The building now accommodates 600 persons, instead of 300, as formerly. Mr. H. Shepherd, of London, was the architect, and Messrs. Latham and Son, of Wakefield, were the contractors. The cost of the work was about £3,000.

On Thursday week the foundation stone of a Mariners' Church was laid in Corporation-street, Belfast, by the Lord Bishop of the diocese. The style is to be Gothic, from plans by Messrs. Welland and Gillespie, architects to the Ecclesiastical Commissioners. The church will accommodate about 600. Cost about £7,000. Mr. Walter Doelin is the contractor.

On Thursday week the new church of St. Paul, Old Brentford, was consecrated. The style is Early Decorated, and sittings are provided for 700 persons. Messrs. Francis were the architects, and Messrs. Nye, of Ealing, the contractors. The cost is between £7,000 and £8,000.

St. Mary's Church, Reading, was reopened on Sunday after restoration. The roof of the nave has been renewed and raised, and the north wall with the buttreses pointed and strengthened; the old tower has also had a new leaden roof. The work has been executed by Messrs. Wheeler Brothers, at a cost of £400.

A temporary iron church, capable of seating 350 persons, was opened on Monday week at Clapton. Messrs. Tupper, of Moorgate-street, were the contractors.

The paragraph which has appeared in ours, and several other papers, saying that the people of Banbury have declined accepting £1,500 towards rebuilding the chancel of Banbury parish church, is without foundation.

St. Paul's Church, Pooley Bridge, Westmoreland, was consecrated on Wednesday week. The style is Early English, the material used being the hard grey stone from quarries in the neighbourhood, relieved, in prominent parts, by a facing of red freestone. At the west end is a belfry, surmounted by a small spire. The nave is 47ft. 2in. long by 20ft. 8in. broad, and the chancel measures 9ft. by 15ft. The pulpit and lectern are of oak, and the font is of Caen stone, with marble pillars. The seats are varnished, with Dantzic oak ends. Messrs. Cory and Ferguson, of Carlisle, were the architects; Mr. Parker, of Penrith, being the contractor. The cost has been £800.

The contract for the restoration of the tower and transepts of Bampton Church has been taken by Messrs. Lord, Flasten, and Williams, of Oxford. The chancel has already been restored by Mr. Luckett, of Faringdon.

On Monday afternoon, at Thixendale, Yorkshire, Sir Tatton Sykes, Bart., laid the foundation stone of an Early English Church, designed by Mr. Street, A.R.A. According to ancient records there was formerly a church at Thixendale, but the only relic is a large Norman font, and even the site of the building is not known. The new church will seat 150 worshippers.

A new Congregational Chapel was opened at Calne, Wilts, on Tuesday week. The style is Early English. The extreme length is 91ft., width 37ft., width of chancel 21ft. The walls are built of native stone with Box dressings, and the interior faced with Farleigh stone. The building seats nearly 500 persons, at a cost of £5,000. Mr. Stent, of Warminster, was the architect, and Messrs. Light and Smith, of Chippenham, the contractors.

On Tuesday, the new church of Emmanuel, at Saltburn-by-the-Sea, was opened by the archbishop. The style is Early Decorated, and the plan consists of nave, north and south aisles, north and south transepts, chancel, and sacristy and organ chamber. The building seats 600 persons, at a cost of £3,500, only the nave, north aisle, and north transept being at present completed. Messrs. Pritchett and Sons were the architects.

The very interesting church of St. Leonard, Warwick, Cumberland, is about to be restored. The building is remarkable for its Romanesque circular apse, beautifully arcaded on the exterior. Mr. Withers is the architect to be employed.

On Tuesday last, the foundation stone for the rebuilding of the village church, Grasby, Lincolnshire, was laid by the rural dean, the old church having become both unsafe and unworthy for purposes of public worship. The new church, which is to have stone tower and spire, is from designs by Mr. C. Buckeridge, architect, Oxford. The church is of the Decorated order of the latter part of the thirteenth century, and the total cost of the restoration will be about £2,500. The builder is Mr. C. Cawthorne, of Retford, and the clerk of the works Mr. J. Pickering.

The quarterly meeting of the Oxford Diocesan Church Building Society was held in the County Hall, Oxford, on Tuesday, July 28. The following conditional grants were made:—Lee, Bucks, Church rebuilt, £80; Linslade, Bucks, Church, £100; Beaconsfield Church, Bucks, £130; Stoke Lyne Church, Oxon, £70; Quainton Church, Bucks, £150; West Hanney Church, Berks, £80; Westwell Church, Oxon, £30; Hampton Poyle Church, Oxon, £100; White Waltham Church, Berks, £100; Wooburn, Bucks, Church restoration, £25; St. Luke's, Maidenhead, Church, £150.

BUILDINGS.

The new Severn Bank Hotel, Newnham, Gloucestershire, has been opened. The building is executed in red brick, with Bath stone dressings, and consists of a basement and two stories. Mr. A. W. Maberley, of Gloucester, was the architect, and Mr. J. Coleman, of Chaxhill, the builder.

The guardians of the Leek Union have decided on the erection of male and female fever and convalescent wards, with nurses' rooms, baths, &c., in connection with the union workhouse at Leek. The arrangements of the proposed new buildings include such provisions as the experience in hospital construction of late years has shown to be indispensable in such buildings. Mr. Sugden, of Leek, is the architect.

The People's Hall, Framlingham, Suffolk, which, with its staircase turret, &c., forms a conspicuous object on entering the town from the railway, has lately been opened. It comprises large hall, reading and committee-rooms, and other conveniences. The works have been executed, under Mr. Sugden, of Leek, architect, by Mr. Bedwell, of Brandeston, near Wickham Market.

TO CORRESPONDENTS.

Notice.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

Received.—W. B.—R. T. H.—L. J. D.—E. W.—E. P.—E. W. H.—T. G.—H. H. S., with MS.—I. S. D., with drawing.—I. D.—O. H. D.—J. H., with MS. returned. I. P. S.—I. C.—A. H. H—I. B. C. B. Correspondence.

THE ORIGIN OF THE POINTED ARCH.

To the Editor of the Building News.

Sir,—In reply to a short article in your last week's issue, let me remark that M. Viollet le Duc, in his *Dictionnaire de l'Architecture*, discusses the origin of the pointed arch. His explanation is this:—"Architects found that semi-circular vaulting yielded inwards at the crown, and outwards at the shoulders. With a view to remedy this, they raised the crown to a point, and depressed the shoulders to a flatter curve, the resulting section being almost exactly that of the two intersecting segments of circles,—the form which was finally adopted." He bears out his theory by reference to many specimens of vaulting executed during the period of transition, that is, about the beginning of the twelfth century, of which he has taken minute and exact measurements. His careful and logical remarks will be found in vol. 4, pp. 25-31 inclusive, under the head "Construction."—I am, &c.,

Student.

THE WALWORTH COMMON ESTATE COMPETITION PLANS.

Sir,—As a competitor in laying out the above estate, I most strongly protest against the absurd manner in which the guardians have awarded the premiums. I must agree with your correspondent of last week in stating that the guardians have gone directly in the face of their own conditions in every particular. One of the plans, obtaining the first premium, contains several plots short of the number written on it, some plots ranging only 13ft. from out to out, which, deducting half the two party walls, and the passage to the street door, leaves 8ft. 1½in. for a room, the depth of some of these plots being only 35ft., others 40ft. The designs obtaining second premiums have interfered with the workhouse property, have courts arranged totally regardless of light and ventilation, and have houses with no forecourts, when the guardians expressly state in their conditions that all houses are to have forecourts not less than 5ft. deep. So much for the decision of the guardians in this matter. Perhaps it is not too late to rectify the error.—I am, &c.,

F. J. W.

Sir,—As authors of the plans to which the first premium has been awarded, we feel bound to take notice of the remarks made by Mr. Klein in his letter to you of last week. In the first place, Mr. Klein says, "The facts are, that the three prizes have all been awarded to competitors who are connected with the parish." We can most unhesitatingly state that we are not connected in any way whatever, either with the parish or with any of the guardians. The two main roads on our plan are shown 60ft. and 55ft. wide, with the exception of a very short portion of one road, which is 50ft. wide, but this was referred to in our report as only a suggestion. With regard to some of the sites being only 35ft., 40ft., and 45ft. deep, Mr. Klein should in justice have added that those were only in cases where sites are shown for double-fronted houses, making the gardens proportionately wide.

With reference to other remarks made by Mr. Klein, we can only take them as his opinion, from which of course we differ entirely; and we think, with good reason, as the guardians, in their letter to us state, that, after mature consideration of the plans and elevations sent in, they have arrived at the conclusion that, the plans most in harmony with their instructions, and adapted to produce the greatest benefit to the parish generally, were those plans to which they had awarded the premiums.—We are, &c.,

M'Murdie, Rust, Wright, and Rolfe.
61, Kennington-road, S.E., August 5.

The following letter has been sent to the Guardians:

To the Guardians of the Poor of the Parish of St Mary, Newington, Surrey.

Gentlemen,—With reference to the following advertisement, which appeared in the Building News of April 4, 1868, viz.:—

TO SURVEYORS AND ARCHITECTS.

"Walworth Common Estate."—The Guardians of the Poor of the Parish of St. Mary, Newington, Surrey, are desirous of receiving plans for laying out the above estate of about 45 acres in new roads and streets, for the erection of private houses and shops. Premiums for *the best plans* will be given as follows:—For the first, 100 guineas; second, 75 guineas; third, 50 guineas. Further particulars and *copy of instructions* may be seen at the Clerk's office as under, between ten and four. The plans must be sent in to me on or before June 1 next.

By Order, Joseph Burgess, Clerk.
Vestry hall, Walworth, March 26, 1868.

We, the undersigned competitors, beg to state that, having sent in plans and designs for laying out the above estate in accordance with such advertisement in the manner required by the *printed instructions* issued to us, do hereby *strongly protest* against the decision lately arrived at by you, on the grounds of its being both inconsistent with the spirit of your advertisement and printed instructions, and most unjust to us. We complain that you have awarded premiums, especially the two first, for plans *which are not in accordance* with those printed instructions, and also do not comprise the sanitary arrangements *which are required* by the Metropolitan Building Act, whilst many of the rejected plans have fully complied with the instructions *and are* in accordance with the act. We are also not satisfied with the third premium awarded.

We therefore respectfully call upon you to appoint a professional gentleman of high standing and character to act as arbitrator, and decide upon the merits of all the plans sent in, and we further suggest that we may be allowed separately to explain our plans and designs before such professional man, and we shall then be perfectly satisfied with his decision.—Awaiting your reply,

We are, gentlemen,
Your obedient servants,

H. M. Burton, 14, Spring-gardens.

Ward and Usill, 10, King-street, Soho, W.
W. B. Moffatt, King-street, Whitehall.

EXHIBITION OF STUDENTS' WORKS, KENSINGTON MUSEUM.

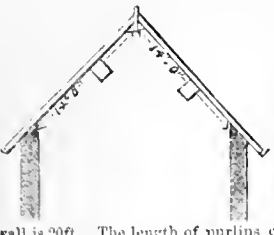
Sir,—This third article on the above works comprises a few remarks on the drawings, and the names of the successful competitors in the following stages, viz.:—(8 b 2) from the antique shaded; (9 a) anatomical studies; (13 a) painting from still life; (17 b) painting the human figure from nature, and a few other stages of less importance. It may be remarked that the above stages constituted the School of Art in its primitive condition; and I hope, but undoubtedly in vain (as long as the artistic fair sex exist), that some of them—such as painting dead birds and single flowers—will be erased from the catalogue. Let Manchester give us a few designs for articles of manufacture worthy of more importance than painting dead ducks, decayed leaves, pitchers, old baskets, and other such things, for which that school alone has this year been awarded one gold medal and four silver ditto, and, I believe, some bronze ones, to say nothing of prize books. The paintings from the group are undoubtedly all very good, both as regards their composition and colour, especially in the case of Mr. Bancroft, who, as an artist, deserves the highest praise. The following is a list of students to whom the authorities have thought fit to award prizes:—E. Bancroft, painting from the group; C. Murray, a drawing from the antique; and C. Locke, a large drawing from the cast—each having received the gold medal. The silver medal has been awarded to the following:—Miss Malcolm, from the group; W. Abbot, for drawing four flowers; Miss Southworth and Miss Ogden, still life; H. Foster, from antique; C. Johnson, a head from life; W. Oliver, from the antique; and to J. Noble, for an anatomical study of the figure. The bronze medallists are—Miss Bowser, E. Bancroft, and Miss Ramery, for drawings from the antique. W. E. Bancroft has also a bronze medal for a portrait study; Miss Haywood for a portrait; Miss Armitage, a study of flowers; T. Pearson, for painting two onions; Miss Jones, C. Gibson, and F. Seymour, from the group; Miss Freeman, for a water colour study of a few pears; Miss Mason, a head of a flower; H. Grant, a study of deal boarding with a dead pheasant; J. Robertson, C. Rough, and R. Thomas, from the east; and to W. Rhodes, for an anatomical study of human feet. Prize books having been given to such a number, I will not encroach on your space by mentioning the names. There are a few landscapes both in oil and water, but that branch, not being encouraged by the authorities, is far in the rear. The sculpture or modelling having been so fully and justly criticised by yourself, I make no comment upon it.—I am, &c.,

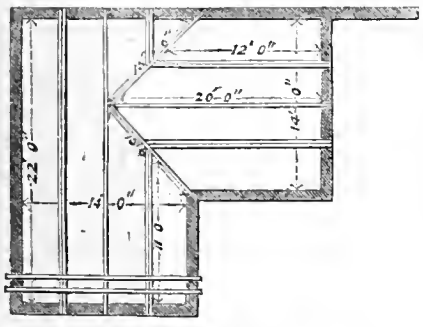
H. A. G.

Intercommunication.

QUESTIONS.

[951.]—ROOF OF NORWAY AND CHRISTIANA SPRUCE.—I have a gable roof to construct of Norway or Christiana spruce, and would feel much obliged if any of your mathematical readers could furnish me with formulæ and data for calculating the dimensions I should give the timbers. The length of ridge, clear of walls, is 22ft., and the length of the other from top of valley to outside of wall is 20ft. The length of purlins clear of bearings, and of spars and valley pieces clear of ditto, are as figured. The covering materials are slates. Required, formulæ for





calculating sizes of ridge-piece, spars, purlins, and valley-pieces. The spars are laid 13in. from centre to centre, and spiked to bond timber.—ENQUIRER.

[952.]—AN OVERLOOKED EXHIBITION.—In the article on this subject in the *Daily News* of the 31st ult., it is stated, in describing the "Iodia Mill," at Darwen, near Blackburn, in which the exhibition is being held—"It is built in the Italian style, and its chimney, which is 100ft. high, is worth a journey to see; its splendid proportions and fine design have no parallel in Europe." Now, if this be a correct description of the shaft, I should be very glad to see an illustration of it in the BUILDING NEWS; or if any sketches of it have already been published, perhaps some of your readers would be kind enough to state where such may be obtained?—SUBSCRIBER.

[953.]—DIMINUTIVE ECCLESIASTICAL EDIFICES.—I should feel obliged if your correspondent who furnished an account of the restoration and re opening of "The ancient little church at Frinton, Essex, the smallest, it is said in England," under heading of churches and chapels, last week, would oblige me and your readers generally with the dimensions thereof. In accordance with the general belief, I have hitherto considered the church of St. Lawrence, Isle of Wight, to be the smallest in England. The dimensions are set forth in the following doggerel, taken from a guide book, and imputed to John Green, the ex-parish clerk:—

"Its breadth from side to side above the bench
Is just eleven feet and half an inch,
Its height from pavement to the ceiling mortar,
Eleven feet, four inches, and a quarter;
And its length from east to the west end—
I tell the truth to you, you may depend,—
'Twas twenty five feet, four inches, quarters three;
But now 'tis forty feet, as you may see.
In eleven hundred and ninety-seven,
'Twas built that we might know the way to Heaven."

It seats 107 people. Although enlarged in 1842 it may still truthfully warrant its general appellation.—F.

[954.]—PRINCE CONSORT MEMORIAL FUND.—You or one of your readers would greatly oblige me by the name and address of the secretary to the National Memorial to the late Prince Consort in Hyde Park.—A. T. NUTT, Windsor.

[955.]—STANDARD CHAINS.—I wish to ask, through your columns, what is the standard surveying chain in France which answers to our Gunter's chain.—A BEGINNER.

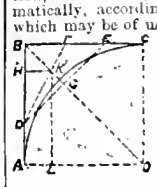
[956.]—SHORING-UP HOUSES.—Can any of your contributors to "Intercommunication" help me in the present difficulty? I have to shore up a couple of houses about 60ft. apart, and the shoring must be done above the ground, as there is not an inch of space available for poles or other timbers. I cannot get balks 60ft. long, and am at a loss to know how to proceed.—CONTRACTOR.

[957.]—TO PREVENT NOISE IN WORKING A BOX LIFT.—I should feel greatly obliged if any of your correspondents to "Intercommunication" would give me an idea of the means I should adopt to mitigate or stop the noise in working a single box lift. The noise is greatest when the box is only lightly loaded, and proceeds mostly from the swaying of the rope which is attached to the box while descending.—W.

[958.]—REMOVING LIMEWASH FROM BRICKWORK.—I shall be glad to learn, through your "Intercommunication" column, of a simple method by which lime whiting or colouring may be removed from the face of brickwork, so as to restore the original red colour.—M.

REPLIES.

[909.]—CENTRE OF GRAVITY.—I am much obliged to "Q. E. F." for his geometrical method of finding the centre of gravity K of the semi-arch. I find, by calculation, that the lengths of the lines in calculating it mathematically, according to his solution, are as follows, and which may be of use:—

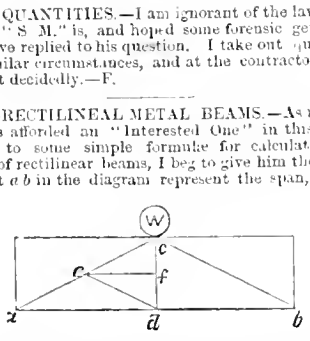


Let radius = A O = A B = 1.
B E = B D = .655.
B F = F E = .3275.
D E (equalising line) = .926.
D F = .782.
B G = .463. G O = .951
B K = .309.
H K = A L = .2183.
H A = K L = .7816. X + Y.

[919.]—FLUSHING HOUSE DRAINS.—In reference to the inquiry of "Tim" as to a method of flushing house drains, I may mention two plans, both of which I have adopted. When I have found a foul smell from my drains, I have taken that opportunity of cleansing my cistern. This should be done just before the water company's supply is turned on, so that when the cistern is emptied it may immediately be replenished. However well covered a cistern may be, it is requisite that it should be occasionally well cleansed, so as to remove all deposits. To this end I lift up the overflow pipe, and thus flush the drains and cleanse the cistern at the same time. I very often cleanse the kitchen boiler by taking several buckets of hot water and pouring them down the sink. This has the effect of removing lumps of grease, which often form the nucleus of offensive matter. As servants will not attend to these things I superintend it myself, and am never troubled with offensive smells from drains. Of course, I have taken special care that all my traps, pipes, &c., are of the best kind and properly fixed. I cleanse my cistern monthly. The other plan is what I call a tippling cistern. It is in use at Derby for the flushing of public water-closets, and effects a great deal of work with a moderate expenditure of water. It is a large vessel hung upon a pivot, and so constructed that when it becomes nearly full it tipples over and empties the whole contents down the flue or pipe where it is wanted. When emptied it regains its place. It is filled by a small screw-down cock, which may be turned partially or wholly on, according to the necessities of the case. I have had a small vessel of this kind constructed, holding about three gallons. This is placed in an enclosed place under my sink, so that all the liquids committed to the sink flow into it, and thus the water is emptied into the drains in a volume and not by driblets. I think I have seen a box of this description made for sale by Mr. Crump, of Derby; but it is so simple a matter that any zinc worker or tin man can make it.—JIM.

[930.]—QUANTITIES.—I am ignorant of the law on the point, as "S. M." is, and hoped some forensic gentleman would have replied to his question. I take out quantities under similar circumstances, and at the contractor's own risk, most decidedly.—F.

[931.]—RECTILINEAL METAL BEAMS.—As no information is afforded an "Interested One" in this week's issue as to some simple formulæ for calculating the strength of rectilinear beams, I beg to give him the following:—Let *a b* in the diagram represent the span, and *c d*



the depth of the beam or girder. Draw *a c* and *c b* and *e a* parallel to *c b* and the horizontal line *e f*. Taking *c d*, equal to the load on the centre (which is half the distributed load), *e f* will equal the horizontal strain caused there by compression on the top and tensile on the bottom flange. These lines, *c d* and *e f*, are proportional to the depth and one quarter the span of the beam. Thus, the following rule is deduced, in words:—as depth : half span : : half load on centre : horizontal strain; or $\frac{W\ L}{4\ D}$. W being load in tons, L span in inches, D depth in inches. For a cast-iron beam taking 6½ tons as the ultimate tensile strain per inch, the formula for finding area of bottom flange would be $\frac{W\ L}{26\ D}$, and for breaking weight $\frac{a\ D\ 26}{L}$, *a* being area of bottom flange. The relative value of tensile and compressive strains on cast iron being as 6 to 1, the bottom and top flanges must bear this proportion. The safe load is about one-third for a dead and one-sixth for a moving load. In a wrought iron beam, taking 20 tons per inch as the ultimate strain, we get $\frac{W\ L}{80\ D} = a$ and $\frac{a\ D\ 80}{L} = B\ W$, with the area of bottom and top flange in the proportion of 11 to 12; bearing in mind that on the top flange the rivets take their portion of the strain, whilst on the bottom flange deduction must be made for them. Another and readier method of finding the strain is to treat half the beam as a lever, *a d* being the long arm and *c d* the short arm, with half the load on centre applied as a force at *a*. Thus,—

$$\frac{W}{2}\ \frac{a\ d}{c\ d} = \frac{W\ L}{2\ D} = \frac{W\ L}{4\ D} = \text{horizontal strain.}$$

It is customary in practice to take D, the full depth of the beam, and ignore the middle web. The more accurate way would be to divide the sectional area into two parts, bearing a proportion to each other equal to the relative values of the compressive and tensile force capable of being resisted by the material of which the beam is composed, and to take D, equal to the distance of the centres of gravity of each part. In applying these formulæ to unflanged beams the latter course is absolutely necessary.—J. L. G.

[931.]—The description of cast-iron beam to which "An Interested One" alludes is, I imagine, accurately represented in fig. 1, and the formula for obtaining its strength is very simple. Let A equal the area of the bottom flange in square inches, L the span of the beam in feet, and D the depth, also in feet. Then the breaking weight at the centre is found by the formula deduced by Mr. Hodgkinson; $W = \frac{A \times D \times C}{L}$. The value of C is 26, where the areas of the top and bottom flanges are in the proportion of about 6 to 1. The beam will bear twice this weight distributed over it. As an example, let the breadth of the bottom

FIG. 1

FIG. 2

flange be 12in., and its thickness half an inch; then, supposing that there are no bolt holes, the area or value of A will be 12 × ½ = 6 square inches. Let the span be 20ft., and the depth 1ft. 6in.; then our calculation for the breaking weight at the centre is $W = \frac{6 \times 1.5 \times 26}{20} = 11.75$ tons.

The breaking weight uniformly distributed over the beam will therefore be in round numbers 23 tons. About one-sixth of this weight may be put upon the beam in practice; therefore 4 tons would be the safe working load in this case. To answer the second part of your correspondent's question we may use the same rule, but must employ a different constant or value for C, which will depend upon the kind of wrought iron to be used. In the kind shown in fig. 2 we may take C = 75, and the problem to be solved is—Given the same conditions as above, what is the value for A? Now W = 23 tons, and, inverting the formula, we have $A = \frac{23 \times 20}{75 \times 1.5} = 4$ square inches. This beam would be able to bear the same breaking load as the other, but we may load it in practice with more than the other, and might safely put 5½ or even 6 tons upon it.—GIRDER.

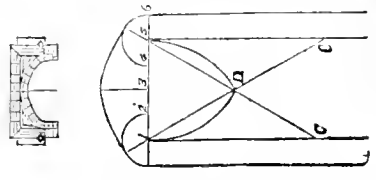
[935.]—REMOVING OLD STAINS AND VARNISH FROM FRAMEWORK.—Let me inform your correspondent that the only effectual way of cleaning the surface of woodwork is to have it scraped thoroughly and repolished. No washing of any kind will accomplish the purpose, and in many instances will only make bad worse.—S. M. P.

[939.]—ORNAMENTAL WATER.—"Hydraulic's" pond would contain about 6,000 gallons.—F.

[940.]—CAST-IRON PILLARS.—Three solid cast-iron columns, 3½in. diameter at the top and 4in. at the base, will be amply strong enough to carry 14 tons, as I have calculated them to a tenth of their breaking weight. There should be an 8in. square cap to a 9in. square base cast on each. I should suggest that they be solid, as the saving of metal in hollow columns of such small dimensions would hardly compensate for the extra expense of having cored castings.—GEO. C. WALTERS.

[940.]—Columns of ½in. metal, 4in. external diameter, would be sufficiently strong.—F.

[942.]—TUDOR ARCHITECTURE.—For the information of "Student," I beg to give a method of drawing the Tudor arch. Divide the width into six equal parts. Draw



the haunch arches from the centre 1 and 5; then describe the arcs 1 D and 5 D; draw straight lines from 1 and 5 through D; continue them to meet the perpendiculars at C C; then C C are the centres to finish the arch. This kind of arch is considered strong.—HOWELL.

[945.]—PAPERHANGERS' WORK.—A piece of paper is 21in. wide, 36ft. long, and contains 7 square yards, or 63 superficial feet. It is customary to allow one piece in every ten for waste. In small patterns, however, this is seldom necessary. French papers vary very much in length and breadth, depending upon the quality; but are generally 18in. wide, and 28½ft. long, containing 4¾ square yards, or 40½ superficial feet. A dozen of borders is 12yds., or 36ft. run. To find the number of pieces of paper to cover the walls of a room, ascertain the number of superficial feet of wall; dividing the same by 9, brings it into superficial yards, and this divided by 7 gives the number of pieces required.—PAPYRUS.

[945.]—Paper for walls and hanging is charged by the piece of 12 yards, and 20in. wide. Find the surface of the walls in feet, and divide by 5 for the number of yards run of paper, which again divide by 12, or by 60 in one operation, will give the number of pieces. Odd yards are charged as one piece. Take in the same manner and charge extra at per piece:—Pumicing and preparing the walls, lining paper and hanging the same; take borders and hangings at per dozen yards run. 4¾ square yards one French piece. French papers vary much in length and breadth, depending upon the quality, but are generally 9¾ yards long and 18in. wide. It is customary to allow 1 in 7 on ordinary papers, and 1 in 6 on satin and other expensive papers for waste.—F.

[945.]—In an excellent little work on quantities and measurements, by Mr. Beaton, we find the following practical directions:—Multiply the round of the room by the height, with all additions and deductions of doors, windows, etc. Divide by 9 to bring to yards, and then by 7 to make pieces. Do the same with lining paper, but with satin and dear papers divide by 6 instead of 7, as there is more waste in those kinds. Calculate all "borders" by the run of a dozen yards.—SURVEYOR'S CLERK.

[945.]—To find the number of yards running, or pieces of paper there are in a superficial quantity, divide the number of superficial feet by 5, which will give the number of yards, then divide the yards by 12, and the quotient will be

the number of pieces required. If any odd yards remain they are considered and charged as one piece. A piece of paper is generally considered to be 12 yards in length and 21in. wide, containing 7 square yards, or 63ft. superficial. It is customary to allow one piece in seven for waste. In small patterns the waste will be less. There are 4½ yards in a French piece; they vary much in length and breadth depending upon the quality, but are generally, 9½ yards long, and 18in. wide. "A Small Builder" should consult a "Builders' Price Book." The above is extracted from Laxton's.—J. J.

[946.]—BALTIC TIMBER.—Memel is, in size, the most useful of the Baltic timber for general use; Riga is superior in quality; Dantzic, if clear of dead knots, is the strongest; and Swedish is the toughest.—P. T.

[947.]—CLAY WALLS.—Clay for building should be a clay marl. If the clay is of indifferent or bad quality, chalk and road grit should be incorporated with it in proportions dependent upon its quality. With moderate clay, two tenths chalk and one tenth road grit will be found ample. The clay and chalk should be beaten to pieces by a heavy prong, and the stones picked out, and should then be formed into a circular bed of (say) one foot in depth and 18ft. or 20ft. in diameter. This bed should be well watered and trodden by horses, and while being trodden short straw should be scattered upon it with a fork, and a man should be employed to turn it over well, so as to bring it all in turn under the horses' hoofs, and a sufficiency of water should also be supplied. The clay should be well trodden, and afterwards rounded up and covered with straw until wanted. When used, it is somewhat moister than brick earth for mouldings. Walls of this description cost £2 5s. 4d. per rod.—J. E.

STATUES, MEMORIALS, ETC.

THE statue of the Duke of Cumberland in Cavendish-square has long been in an unsafe and dilapidated condition. The Duke of Portland has offered to have it re-cast at his own expense, and the Marylebone Vestry have accepted the offer.

A statue of Bernard Palissy has been executed for his birthplace, Saintes, by M. Taluer, and was inaugurated on Sunday last.

The statue of Lord Clyde was unveiled in George-square, Glasgow, on Wednesday. It represents the hero in undress uniform. He stands erect, with one foot advanced, resting his left hand, which grasps a telescope, on the stump of a tree, while his right, hanging by his side, holds an Indian helmet. The statue, which is in bronze, has been executed by Mr. J. H. Foley, R.A., London, at a cost of £1,200.

LAND AND BUILDING SOCIETIES.

THE first general meeting of the shareholders of the United Land Company was held last week. The directors have secured two highly eligible estates in East Surrey and Middlesex, and due notice will be given when these two estates are to be offered for sale.

On Monday evening, a soirée of the Manchester and Salford members of the Artisans, Labourers, and General Dwellings Company, Limited, was held at the Trevelyan Hotel, Manchester. The principal objects of the society (of which the Dean of Westminster is the president) are to provide the working classes with healthy and substantially-built dwellings, and to enable householders to convert their rent into purchase money, and so to purchase the houses they live in. There is a local council for Manchester and Salford, on which are the three hon. gentlemen who represent those boroughs, and to suit the Salford shareholders the company has secured a plot of land in Phœbe-street, Salford, where the building of improved dwellings for workmen will shortly be commenced. At the meeting the chair was taken by Mr. R. D. Rusden, and the assemblage, which was a numerous one, was addressed by a deputation from London, who explained the nature of the society's objects, and gave statistics as to its operations.

LEGAL INTELLIGENCE.

ACTION AGAINST THE OLDHAM CORPORATION FOR DEFECTIVE SEWERAGE.—This was an action brought by the plaintiffs, Messrs. Buckley and Procter, against the Mayor and Corporation of Oldham, to recover damages for injuries which had been occasioned to certain drapery goods in consequence of the negligence of the defendants in not keeping their drains in proper condition. The plaintiffs were drapers carrying on business at Mumps, which is part of the town of Oldham. On July 10, 1867, the town was visited by a heavy downfall of rain, and owing, as was alleged, to the defective character of the drainage, the plaintiffs' cellars were flooded, and a quantity of drapery goods which were stored therein considerably damaged. The town was originally drained by an old sewer, which terminated in Albert-street; but after the borough was incorporated, an act of Parliament was obtained by which the Corporation obtained powers to lay down a new system of drainage. The Corporation of Oldham borrowed considerable sums of money for the purpose of laying down a new system of sewerage; but those sewers were not only very badly planned, but also very badly constructed. They were wholly inadequate, even in cases of a very moderate downfall of rain. The corporation were bound to provide for the maximum amount of rainfall, but the counsel for the plaintiffs stated that the rainfall on July 10 which caused the damage complained of, was only .66 or .67, which was very much below the amount that had previously fallen. At the conclusion of the opening statement, the Lord Chief Baron said he did not think that any useful result could be obtained by trying the case. It was no doubt the duty of the Corporation to place the sewers in a proper condition. They might go on from time to time, case after case, and litigation after litigation, without, after all, coming to any satisfactory conclusion. It appeared to him that the proper course would be to refer the matter to some competent person to examine the sewers, and the question of liability would of course depend upon his award. The plaintiffs electing to take the opinion of the jury a verdict for the plaintiff was returned subject to reference.

NOTICES OF BOOKS.

Examination of a Report by Robert Rawlinson, Esq., C.B., to the Walton Local Board, on Messrs. Reade and Goodison's plans for the sewerage of the township of Walton. By READE and GOODISON, Civil Engineers, Liverpool.

IN publishing this examination of Mr. Rawlinson's report the author states they are prompted by a desire to let the public judge between the relative merits of the sea outlet proposed by the West Derby Board, and recommended by Mr. Rawlinson (as described in the BUILDING NEWS of July 3, 1868) and the one they propose along the course of the River Alt, in which utilisation by irrigation forms an essential part of the scheme. They allege that on the strength of a promise made by the chairman of the West Derby Board to the Walton authorities, to consider impartially any scheme which the latter board might lay before him, they received instructions to combine with the sewerage plans which they were then preparing for the Walton district, a joint scheme of outlet sewers with West Derby for the disposal of the sewage of both townships. The plans were accordingly completed and submitted to Mr. Rawlinson for him to report thereon, but, on the 29th of June, much to their surprise, at a public meeting held at the West Derby Board room, he, before sending in his report to the Walton Board, recommended the inhabitants of West Derby to decide at once upon the sea outlet. In his subsequent report to the Walton Board he recommended that body to join in the outlet scheme he had advocated at West Derby, and then at some future time, having secured a permanent means of preventing river pollution, to grant a concession of the sewage if it were applied for. In consequence of Mr. Rawlinson's opinion, the West Derby Board have resolved not to entertain the scheme proposed by Messrs. Reade and Goodison, and they, feeling that both themselves and the Walton Board have not been met with courtesy or good faith, are not prepared to let the utilisation question drop, until the public have had an opportunity of expressing an opinion upon it. The principal difficulties apprehended by Mr. Rawlinson in the application of sewage to land are, obtaining "a suitable soil, appropriate seed, fine weather, and economical manipulation." To these, Messrs. Reade and Goodison reply that when shown the ground upon which they proposed to operate, his opinion of it was favourable, both as to its capacity and its cost, that with regard to suitable seed, fine weather, and economy of management, the difficulties on their account are common alike to all farming operations. "Sewage irrigation," says Mr. Rawlinson, "must be a speciality if it is tied up with the absolute disposal of the entire sewage of any district." This statement the author of the pamphlet before us cannot reconcile with Mr. Rawlinson's own recommendation in a paper read by him before the Society of Arts, March 21, 1862:—I do not advocate the pollution of rivers, but the application of sewage to land for agricultural uses. If it will not pay in some cases as a commercial speculation make it compulsory, and pay the cost by a rate." The fact appears to be that, while generally in favour of utilisation, Mr. Rawlinson is of opinion that in the present case the outlet scheme would be more advantageous. This proposition Messrs. Reade and Goodison controvert at some length, and conclude by expressing their conviction that the proposed Rimrose outlet, if carried out, will prove a costly and gigantic blunder.

Works in Iron. By ANDREW HANDYSIDE and Co., Britannia Ironworks, Derby, and 32, Walbrook, London. Illustrated by photographs. London: E. and F. N. Spon, 48, Charing Cross, 1868. (Copyright.)

IT is often asserted that the constructive element is so strong in the engineer, the idea of the useful is so predominant in his mind, as to exclude nearly every other consideration that might concern the display of æsthetical principles. To some extent the statement is correct. Many years ago, at the first introduction of iron, before it assumed the position it now occupies as the chief material for construction, its application was necessarily limited to those examples which did not admit of any architectural treatment. But with the extended—we may say, universal—use of iron, instances are constantly presenting themselves in which it can be employed with considerable good taste and æsthetical effect. Consequently the assertion, which was perhaps really true when first put forward, is now no longer so, and every day tends to detract from its former veracity. In the little volume to which we allude in our present notice, the whole question of the application of cast and wrought iron to the purpose of construction and ornament is fully gone into. As will be readily understood, the same quality of iron is not always required for every different description of work. There is no necessity for insisting in a stringent specification that iron bars and plates should bear so severe a strain as twenty-four or twenty-six tons per square inch of sectional area, where a tensile strength of twenty to twenty-two tons will meet all the requirements of the case. This subject is well explained in Messrs. Handyside's little treatise, and the distinction where iron of a less tensile strength may be used is clearly defined. Several photographs illustrate the bridge work, both native and foreign, executed by the firm, and their colonial truss bridge, designed for rapid and easy erection abroad, is not only practically but also theoretically sound. The design is correct in principle and practicable in execution.

Passing on to roofs, we find the Agricultural Hall in London, the Amsterdam station of the Dutch Rhenish Railway, the Broad-street station of the North London line, and several other large and important works executed by the firm. The truss principle is that usually selected, as it offers the greatest facility for the employment of iron in those particular examples, and also presents a pleasing effect to the eye. The trussed, or open roof, bears the same analogy to the heavy massive timbers of olden times as the lattice girder does to the solid-sided system. In engines the Derby firm have supplied the power requisite for the Maidstone Waterworks Company, and also put up winding engines of very large dimensions for the Moira Colliery in Leicestershire. Pumping, mining, and hydraulic machinery is also manufactured upon a large scale at the Britannia Ironworks. It is a pity the operation of making lead pipes, which is carried on by the firm, was not more fully described in the volume, although there was probably no space available for so doing. The process is very peculiar, and illustrates in a remarkable manner the conclusions arrived at by M. Tresca respecting the floors of solid bodies. After perusing with much satisfaction that portion of the treatise relating to the constructive, we pass on to the part embracing the ornamental. We here find that the same material which can be cast in proportions sufficiently massive to resist the passage of the heaviest locomotive, can be made to assume all the delicacy and lightness of filagree work. Vases, fountains, lampposts, pillar letterboxes, gates, railings, and other examples bear witness to the almost Protean character of cast and wrought iron. Useful for reference, handy as a guide, and reliable as an authority upon estimates, the engineer, architect, and all those concerned in designing and erecting structures and buildings will find Messrs. Handyside's *brochure* valuable in their office. When it is considered how very seldom it occurs that any large work is executed at all within the original estimates, any reliable data upon which to frame them is of more service than all the drawings and theory that could be put together.

Our Office Table.

The general summer meeting of the Leicestershire Architectural and Archæological Society will be held at Kegworth in the last week of August.

At a meeting of the St. Pancras Board of Guardians on Thursday week a letter was read from Mr. Robins, architect, asking, as a favour, the return of certain designs for the proposed enlargement of the workhouse. As Mr. Robins had been paid his commission by the Guardians on the abandoned plans, the application was refused, except as to the designs for which payment had not been made.

The manorial rights over Peckham-rye, Goose-green, and Nunhead-common have, according to a local paper, been bought by the Camberwell Vestry for £1,000. These pieces of ground will, therefore, be preserved as parks or recreation grounds.

The sum borrowed by the Metropolitan Board of Works, since its formation, amounts to £8,073,000. Of this sum £400,000 have been required for the Covent Garden approach and the Southwark and Westminster communication: £4,200,000 for main drainage, and £2,480,000 for the Thames embankment. The sum already paid off is £1,520,633 6s. 8d.

M. Depleechins, who is at present engaged in the decoration of the New Opera House at Paris, has been commissioned by the directors of the Lyons and Mediterranean Railway to paint for their principal station four pictures, each 9 metres long by 5 metres in height, representing the four great towns on their line—Paris, Montpellier, Marseilles, and Geneva. It seems that, out of England, even railway stations are thought worth decorating, and with something more artistic than aristocratic-looking figures enveloped in "A. Lyne's 20s. overcoats."

Dean Stanley deprecates the suggested removal of St. Margaret's Church, Westminster, and recommends the addition to the abbey of a cloister, which should be connected with the abbey by Poet's-corner, and continued on the space behind Abingdon-street, facing the Palace of Westminster on one side and the College garden of the precincts of Westminster Abbey.

At the examination held by the Institute of British Architects on Thursday and Friday last, the following gentlemen were recommended for certificates of competency for district surveyorships:—Mr. Arthur Allom, Mr. Robert C. James, Mr. Lacy W. Ridge.

As usual, says the *Pall Mall Gazette*, the English public will become very talkative, if not very wise, over the Manchester catastrophe. No professional men seem to be so stupid as those planners and copiers who call themselves architects. It is all the more unfortunate that the Government should not bestir themselves on behalf of the public, and decide once for all that ill people will crowd and cram themselves into theatres, music-halls, and meeting houses of various kinds, the means of egress therefrom shall be of the amplest possible character. It is surely as easy to determine how a few thousand people may get out of a public building in five minutes as it would be to regulate and compute the emptying of a cistern of water through orifices around its edge; but this has not been thought of for centuries. Ancient Roman buildings might have supplied a hint to our architects, but it has not been taken. And at the present moment there is not a hall or theatre in London in which, when full, if a panic arose from fire or false alarm, less than a dozen people would certainly be killed. There is the Alhambra, for instance, a music hall of a singularly inflammable character, with flaring gas, tipsy smokers, and everything tending to promote combustion, and yet with, practically, only a single narrow and inconvenient exit. One shudders to think of what may happen there any night. If the threatened artisan is to appear in the new Parliament, let us pray that he may be a skilled bricklayer.

The special gas committee of the corporation of London have presented their report. They review the legislation of the past session, which, combined with the determination of the Metropolitan Board of Works to construct a solid embankment at Blackfriars, it is hoped will ultimately lead to the removal of the gas works from the neighbourhood of the Temple. The committee of the corporation were appointed in October, 1865, and the supply of gas was then regulated by the Gas Act of 1860, which fixed the illuminating power of common gas at 12 candles, and the price at 4s. 6d. per 1,000 cubic feet. The present price and illuminating power are 4s. and 14 candles, but in 1870 they will be 3s. 9d. and 16 candles. The price of cannel gas of 20 candles will also be reduced from 7s. 6d. to 5s. 6d. per 1,000 cubic feet to a rate proportional to the price of 3s. 9d. for 16 candle gas. There are provisions in the new act under which the price of gas and its illuminating power may, after January, 1870, be diminished or increased, but the committee are confident that if any change were made it would be by way of reduction in price. The committee, in conclusion, congratulate the Court of Common Council on the satisfactory termination of the contest in which they have been engaged during three sessions of parliament, and they believe the result of their labours will be to secure an abundant supply of gas of high illuminating power at a moderate price.

Mr. T. C. Clarke, late the assistant engineer to the borough of Portsmouth, has been appointed, out of 71 candidates, surveyor for the city of Oxford.

The third general meeting of the Architectural and Archæological Society of Durham and Northumberland was held on Thursday week at Blanchland. After visiting the Church of the Premonstratensian Canons, and other places of interest, the party proceeded to Shotley Bridge to dine, afterwards returning to Newcastle.

A correspondent calls attention to the shameful state of the Adelphi dark arches. The pestilential vapours which arise daily and nightly from these arches are enough to foster epidemic diseases. He calls on the Board of Health of the parish of St. Martin's to interfere, both for the sake of their own credit and the public health.

Mr. Henry Jarvis, surveyor of sewers to the Newington Vestry, has tendered his resignation, assigning as his reason for so doing the great increase of work lately thrown upon him.

The premiums for laying out the Walworth Common Estate have been awarded as follows:—Messrs. M'Mardie, Rust, Alfred Wright, and J. P. Rolfe, the first premium of one hundred guineas; Messrs. Jarvis and Son, the second premium of seventy-five guineas; and Mr. J. T. Lepard, the third premium of fifty guineas.

An International Congress of Archæology and History has been organised by the Society of Antiquaries of the Rhine, and is to be held at Bonn from the 11th to 21st of September, under the honorary presidency of Prince Frederick William of Prussia and the presidency of Herr Nöggerath, president of the society, and Herr von Quast, keeper of historical monuments in Prussia. The regulations are similar to those for the International Congress held last year at Antwerp. German is to be the official language of the meeting. There are to be three sections; primeval antiquities, pagan antiquities, and antiquities of the Christian era. In connection with the Congress, an exhibition of objects of art and antiquity (selected from special collections or churches which are little known and of peculiar interest) will be held. The churches of Schwarz-Rheindorf, Heisterbach, and Cologne will be visited, and excursions to various places of interest will be made. Persons wishing to take part in the Congress should address to the President of the Society of Antiquaries of the Rhine, at Bonn.

A new diamond drill for perforating rocks has recently been constructed by the Windsor (U.S.) Machine Manufacturing Company. Instead of setting the diamonds in the form of a ring, which when rotating forms a cone, and has proved a failure, the diamonds are so set as to form a solid drill head, cutting the full size of the hole. The drill is worked by a small oscillating steam engine, connected with the drill carriage. It is said that 500ft. have been bored in granite, marble, and quartz with one drill head, without the slightest appreciable wear in the diamond points.

Nothing is so charming and refreshing to the eye as an harmonious arrangement of colours. They are "like a sweet chord of music to the sense." The hand of nature never errs, whether it brings together scarlet and crimson, as in the cactus; scarlet and purple, in the fuschia; yellow and orange, as in the calceolaria; or the colours in the various plumage of exotic birds—the harmony is always beautiful, ever perfect. I will suggest a few contrasts:—1, black and warm brown; 2, violet and pale green; 3, violet and light rose colour; 4, deep blue and golden brown; 5, chocolate and bright blue; 6, deep red and gray; 7, maroon and warm green; 8, deep blue and pink; 9, chocolate and pea-green; 10, maroon and deep blue; 11, claret and buff; 12, black and warm green.

The new American railway constructor, which was described in the BUILDING NEWS some time since, is said to work very well in the States at a rate of about one mile per day. The chief contractor of the road gives it as his opinion that when the machine is improved by making a few changes in the method of handling rails and ties it will be able to put down five or six miles per day. This will render it possible to lay down track twelve times as fast as the usual rate by hand, and it will do the work at less expense.

Trade News.

TENDERS.

READING.—The town council of Reading have just received tenders for the erection of a new bridge over the Thames connecting the boundary of the borough with the village of Caversham. There were twenty tenders submitted, the highest being £13,400, and the lowest £5,995. The latter, by Messrs. Shaw, Head and Co., Cannon-street, was accepted. It is expected that the bridge will be completed by the end of the autumn.

BRIGHTON.—For alterations to shop in Black Lion-street, Brighton, for Messrs. Holders. Quantities supplied by H. Lansdown and Co. Messrs. Goulty and Gibbins, architects, London and Brighton:—

H. Parsons	£712
J. T. Chappell	681
G. Cheesman and Co. (accepted)	668

CHELTENHAM.—For the erection of the County Court and Offices. Mr. T. C. Sorby, architect:—

Billings and Sons	£6300 0 0

FITTLEWORTH.—For works at Fittleworth Rectory, for the Rev. — Cattley. Messrs. Waring and Nicholson, architects:—

King, Fittleworth	£412
Nightingale, Lambeth	359
Habbing, Petworth	348

HACKNEY.—For alterations, repairs, &c., to the Hackney-road Wesleyan chapel. John Tarring, architect, 69, Basinghall street, London:—

Dunn and Sons	£593
Sulman	591
Hill and Sons	549
Saunders	530
Hall	450
Shurmur	444

LONDON.—For alterations and additions to premises, Hampstead road, for Mr. Oetzmann. Mr. C. Eales, architect:—

Corsman	£3700
Bywaters	3653
Fish	3513
Clark and Co.	3400
Mudey and Rogers	3287
Mann	3275
Scrivener and White	3027
Kelly Brothers (accepted)	2974

WALTON-ON-THAMES.—For villa residence. Messrs. Bacon and Bell, architects:—

Jackson and Shaw	£3085
Patman and Fotheringham	2998
Nicholson	2980
Francis	2949
Higgs	2923
Sharpington and Cole	2877

WHALLEY (Derbyshire).—For the erection of a school &c., for the Rev. T. C. Hills. Mr. S. Rollinson, architect:—

Mason, &c.—Wragg and Dearnly (accepted)		£200
Joiner, &c.—Langley	,,	190
Slater.—Marjerrison	,,	30
		£420

COMPETITIONS.

LINCOLNSHIRE (LINDSAY).—Extension of time till September 1.—Plans for the erection of a gaol and house of correction. J. H. Holloway, Clerk of the Peace, Spilsby.

HERTFORD COTTAGE PRIZE COMPETITION.—Sept. 1.—Design for model cottages for agricultural labourers. Premium, £20. R. Dimsdale, Esq., M.P, 9, Queen-square Westminster.

CONTRACTS OPEN FOR BUILDING ESTIMATES.

HALIFAX.—Extension of time.—For proposed new infirmaries, fever hospital, &c., at the Halifax Workhouse. C. Barstow, Clerk to the Guardians.

STOKE-UPON-TRENT.—August 13.—For the erection of a new manufactory. C. Lynam, architect, Stoke-upon-Trent.

NOTTINGHAM.—August 18.—For the erection of a new bridge over the river Trent. W. Enfield, public offices, Nottingham.

GRANTHAM LOCAL BOARD.—August 11.—For the construction of sewers, &c. H. Beaumont, clerk, Grantham.

ABINGDON (Berks.).—For the erection of a boys' and girls' school. E. Dolby, architect, East St. Helen's, Abingdon.

LONDON, BRIGHTON, AND SOUTH COAST RAILWAY.—August 11.—For the construction of a locomotive running shed, &c., at Battersea. A. Sarle, London Bridge Station.

PORTSMOUTH.—August 22.—For laying down, constructing, and finishing various brick, pipe, and cast-iron sewers. S. J. Elliott, clerk to the Local Board.

CONTRACT DEPARTMENT, ADMIRALTY.—August 18.—For the supply of steel and files.—August 11.—For the purchase of English oak treenails. A. Brady, registrar.

SAINT ISSELL (Pembrokeshire.)—August 16.—For erecting a new British school room at Saundersfoot. Mr. T. Matthias, chemist, Saundersfoot.

LANCHESTER (Durham.)—For making a branch railway at Hamsteels Colliery, near Lanchester. Mr. John Boyd, on the premises.

CHATHAM EXTRA, KENT.—August 13.—For the erection of the chapel, walls, &c., of the new burial ground. T. Hills, clerk to the local board.

KIRBY, NEAR PRESCOT.—August 17.—For the erection of a church. Mr. E. G. Pale, architect, Lancaster.

CARNARVON.—August 15.—For the execution of the Carnarvon harbour works. F. Jackson, C.E., Nottingham.

HAMMERSMITH.—August 17.—For the erection of a chapel, entrance lodge, &c., at the burial ground in Fulham-fields. A. J. Roberts, clerk to the board.

NEWHAVEN, SUSSEX.—August 24.—For the erection of a Coastguard station. Tenders to the Coastguard office, Admiralty.

HEREFORDSHIRE COUNTY AND CITY ASYLUM.—September 14.—For the erection of the above named building. R. Griffiths, architect, 3, Martin-street, Stafford.

ISLE OF WIGHT.—August 13.—For the erection of artillery carriage sheds. Colonel W. C. Hadden, Royal Engineer office, Portsmouth.

ALDERSHOT.—September 15.—For the erection of a billiard room at the Royal Artillery barracks. Royal Engineer office, Aldershot.

MARYPORT DISTRICT AND HARBOUR TRUST.—August 17.—For the erection of an engine and boiler house adjoining the Goat Mills, near Cockermouth. J. Barwise, clerk to the trustees.

WAR DEPARTMENT CONTRACT.—August 15.—For laying a new cast-iron water main at Royal Victoria hospital, Netley, Southampton

St. MATTHEW, BETHNAL-GREEN.—August 10.—For the erection of a lodge at Leytonstone House, Leytonstone. W. T. Howard, clerk to the board, Bishop's-road, Bethnal-green.

METROPOLITAN BOARD OF WORKS.—September 24.—For constructing and maintaining in repair certain intended brick sewers. J. Pollard, clerk, Spring-gardens.

CATERHAM.—August 29.—For the erection of an asylum. W. F. Jebb, 37, Norfolk-street, Strand.

SUNDERLAND.—August 17.—For the erection of new schools in connection with the Union workhouse. F. Hodgson, clerk to the guardians.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

William George Boakes, Deal, painter, August 14, at 11—Robert Harradine, Edmonton, builder, August 14, at 12—Richard Watling, Romford, timber merchant, August 14, at 12—Alfred Charman, Croydon, carpenter, August 12, at 1.

TO SURRENDER IN THE COUNTRY.

John Amess, Bristol, timber merchant, August 14, at 11—Robert Daynes, Norwich, plasterer, August 17, at 11—Richard Hoad, South Shields, builder, August 15, at 12—Richard Robinson, Monk's Coppenhall, joiner, August 14, at 12—Robert Wilcock, Seacombe, plumber, August 14, at 10.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

October 21, W. Robins, Holloway, carpenter—October 27, G. Ford, Newman-street, Oxford-street, carpenter—October 28, T. Spearing, Hungerford road, Holloway, builder—August 24, W. Brown, Barnby-on-the-Marsh, Yorkshire, joiner—September 22, B. Bottomley and G. Spencely, Halifax, stonemasons—August 22, R. Fearns, Ormskirk, painter—August 19, G. Smith, Thurcaston, Leicestershire, carpenter—September 16, W. Cockram, Witheridge, Devonshire, carpenter.

PARTNERSHIPS DISSOLVED.

Parkinson and Brooks, Long lane, Bermondsey, engineers—Gibson and Fisher, Nottingham, stone and marble masons—Harding and Wilkinson, Commercial Chambers, Gracechurch-street, timber merchants—Graveley and Ewing, Upper East Smithfield, and East India road' engineers—Aviss and Son, Putney, builders—Cresswell and Williams, Tipton, brick manufacturers—Jenkins and Smith, Newport, masons.

DECLARATION OF DIVIDENDS.

Sir S. M. Peto, Great George-street, contractor, div. 2s. 7d.; E. L. Betts, Great George street, contractor, div. 2s. 2d.; Sir S. M. Peto and E. L. Betts, Great George-street, contractors, div. 1s. 10d.—August 5th, 6th, and 7th, or following Wednesday.—J. Smith, Litchurch, near Derby, engineer, div. 1s. 6d.—R. C. Moore, Harmiston, Lincolnshire, surveyor, div. 6s.

DIVIDENDS.

August 26, J. Sanders, Aston juxta-Birmingham, builder August 26, J. Ainsworth, West Ardsley, Yorkshire, mason—August 17, T. Machin, Walsall, journeyman bricklayer.

THE BUILDING NEWS.

LONDON, FRIDAY, AUGUST 14, 1868.

BLUE-BOOK—SCIENCE AND ART.

THE Blue-book containing the fifteenth annual report of the Science and Art Department of the Committee of Council on Education, has just been published. It is a most interesting report of about three hundred and twenty-five pages, containing the reports of the official inspectors in the various branches, and statements of the expenditure of the several divisions of the Department of Science and Art. The report is arranged under the following heads :—1. Aid given to the industrial classes in obtaining instruction in the branches of science and art which have a direct bearing on their occupations. 2. The administration of the South Kensington Museum—the central repository for examples of science and art, which, as far as practicable, are made available throughout the United Kingdom. 3. Institutions for the promotion of science and art, which are subject to the superintendence of this department. As respects science, the satisfactory progress reported in former years, both as to number of schools and students, has been maintained. In 1860 there were 9 schools and 500 students; in 1864, 91 schools and 4,666 students; and in 1867, 212 schools and 10,230 students. The payment to teachers for the year 1867 was £7,976, or 15s. 6d. for each pupil. The number of teachers paid was 194. These figures speak for themselves. The report by Captain Donnelly, Appendix B, Science Instruction, occupies thirty-seven pages, giving a list of the schools, the subjects of study, the number of students, and the amount of money paid to science teachers. The reports of Dr. Sidney, occasional inspector, and Mr. Bartley, official examiner, are likewise given. The former inspected, in 1867, 31 science schools in England, 7 in Scotland, and 42 in Ireland. It is interesting to notice the classes to which the students belong in the respective countries.

In England the number of students of the artisan class was 490, of the industrial 466, and of the middle class 243. In Scotland there were 237 of the artisan, 94 of the industrial, and 32 of the middle class. In Ireland, 427 of the first, 1,094 of the second, and 191 of the last. Dr. Sidney then notices a wonderful fact, viz., that he has observed "the smaller proportion of bonâ fide artisans in attendance at these schools in Ireland as compared with the sister country, owing, of course, to the much greater development of manufacturing enterprise in England." If Dr. Sidney had observed nothing more remarkable than this he would be a very unfit occasional inspector, but he has observed something more serious than that England is a greater manufacturing country than Ireland. He bears testimony to the apathy of the local committees; he says, "even the secretaries are too often but ill-informed of the rules laid down for the guidance of their classes." Moreover, "the Irish committees have availed themselves only to a very small extent of the minute of the Department which grants 50 per cent. towards the purchase of apparatus for science classes; but this remark does not apply to the model schools, which are abundantly supplied with every requisite by the National Board." Of model schools in Dublin there appears to be one, but the report is not clear. In Galway one, in Belfast one, in Carrickfergus one, in Larne one (a model farm school), in Ballymena one, in Newtownlands, Trim, and Enniscorthy, one each. Still, with all the shortcomings of Ireland it is not explained why the total number of the schools visited by Dr. Sidney should be thirty-one in England, seven in Scotland, and forty-two in Ireland. It is true that at the Belfast model school, on the occasion of an examination, he found only one member of the committee present, and that at Newtownlands he had a candidate expelled for using what boys call a "crib;" and he noticed an extensive and organised system of fraud in connection with some of the Belfast examinations as well as at Clifden in Galway. Mr. Bartley's report on the same subject is confined to England, and to twelve counties only, including his attendance at the May examinations in Middlesex and the Bristol Trade School. He complains that so few schools of science exist in Yorkshire: "Considering the size and importance of many of the towns in this county it is to be regretted that so few classes have been formed, and that those which exist in such places as Leeds, Huddersfield, and Middlesboro, contain so few pupils. The reason generally given is the deficiency of elementary instruction among the persons for whose benefit the classes are formed; and though, no doubt, this cause acts very powerfully in reducing the attendance at the science classes, yet it certainly is not the entire cause, nor can it explain the attendance of under twenty artisans at the chemistry class in a town like Leeds, with over 200,000 inhabitants. I feel sure that if the Department scheme were taken up in Yorkshire as it is in Lancashire, by the union of Lancashire and Cheshire institutes, it would not be long before the classes and students were increased tenfold." With regard to the schools of science in the Midland counties, that is to say, the counties south and south-east of Yorkshire and north of London, there are only sixteen schools, and one of these, at Derby, is for the middle class, and merely sends up pupils for examination. Nine of these schools Mr. Bartley visited and found them, with the exception of those at Eastwood and Lincoln, in a flourishing condition, particularly that at Northampton, to which local advantages have conduced, the committee being most influential, and a museum existing in the same premises, supported by the application of the Public Libraries Act. The report bears testimony to the excellent effects produced by the fact that the local committee knows its duties and possesses an energetic secretary.

The report states that 98 schools of art are now in operation throughout the country. These give instruction to 17,341 students—a slight increase as compared with 1867. During the year one school at Abingdon has been closed; and another at Greenock, ceasing to fulfil the conditions of an art school, has become a night class for artisans. New schools have been established at Dorchester and Kilmarnock. The influence exercised by these schools will have been best estimated by those who visited the various works exhibited at the late national competition. The examiners state in their report that the work of these schools is acting satisfactorily upon the manufactures of the country. The large number of meritorious designs applied to manufactures induced them to award an additional gold medal; while in another class—that of modelling the figure from the antique—the inferior character of the examples submitted to them prevented them from awarding any gold medal at all. The examiners notice that in some cases students in the modelling classes, in executing bas-reliefs, have selected subjects incapable of being well treated in that manner; and they recommend that all such positions of the figure as require perspective foreshortening for their representation should be avoided, and that the action of figures in low relief should be so designed that they may lie in positions parallel to the ground on which they are modelled.

They notice with condemnation a few examples of injudicious misdirection of students' labours, in which fine examples of the best periods of art are carelessly rendered as mere accessories in the construction of half-pictorial backgrounds, a practice which has the bad effect of distracting the student's attention from the details of the figure before him.

In our remarks on the late competition at South Kensington we noticed the strange fact that Birmingham, Manchester, Sheffield, Leeds, and other large towns in the United Kingdom, from which most might be expected, contributed the worst and the fewest examples. We certainly expected that the report now before us would have alluded in some way to this fact. It does not; and we therefore suppose the point was not deemed worthy of attention, as it certainly could never have escaped notice.

The report of the master of the National Art Training Schools shows that twenty-eight students in training for masterships of schools of art have received allowances for maintenance. Four of these have been appointed to local schools. Free studentships were allowed to thirty-seven students who had succeeded in gaining medals or passing examinations. Sixteen sappers of the Royal Engineers and thirty other persons, either former students in training, national scholars, or persons employed by the Department, have attended the school without payment of fees. 422 students paid fees for the first session of the year, and 406 for the second session; the total amount paid being £1,946 2s. The total number of students in the year was 727, as compared with 807 in the preceding year. This decrease the Department attributed to a change in the admission rules, designed to exclude mere superficial amateurs desirous of taking "a few lessons" only.

The examinations conducted under the management or in connection with the committee during the year may be summarised as follows :—As respects schools for the children of the labouring poor, 788 schools were examined, being an increase of 200 on the number examined in 1867; 87,300 exercises worked by 58,000 children were examined, being an increase in the year of 17,300 exercises and 15,106 children. As respects schools of art and night classes, the number examined in 1868 was 204, being 38 more than in 1867; 8,500 students worked 16,700 exercises, an increase during the year of 1,700 students and 4,200 worked papers. 152 of these schools and classes sent up for examination 51,000 drawings, executed by 8,000 students in the ordinary course of the year's study, an increase of 24 schools, 19,000 works, and 1,500 students. In 1867, out of 44 candidates examined for the third grade, or art teacher's certificate, 15 were successful. In February, 1868, 62 candidates were examined, and 25 succeeded in passing the required examinations. The results show a total increase in twelve months of 240 schools examined, 18,306 candidates, and 40,500 works and exercises. In 1867 the number of persons receiving instruction in drawing from teachers holding drawing certificates granted by the Science and Art Department was, in public and other schools, 79,411; in provincial schools of art, 14,639; in metropolitan district schools of art (including those in connection with the National Art Training School), 2,702; students in training for masters and national scholars at South Kensington, 44; schoolmasters and pupil teachers, 1,651; in night classes for instruction in drawing, 2,553; in private schools, grammar schools, &c., 4,529. Total, 105,529.

The second portion of the report, which treats more especially of the Museum at South Kensington, states that the decorations of the exterior and interior of the lecture theatre buildings are now in a forward state; the designs, as far as possible, being carried out by the students of the Department, under the supervision of the various artists who have furnished them. A high degree of excellence is anticipated for the classes for modelling, mosaic work, painting on tiles, &c., which

will eventually prove of great service to the decorative arts of the country.

Among the various objects presented to the Museum during the period embraced by the report, an important series of illustrations of the method of instruction pursued in the schools established by Messrs. Schneider at their works at Creuzot, are specially worthy of notice. Acting on the recommendations of a Select Committee of the House of Commons, the Department availed itself of the opportunity afforded by the Paris Exhibition to acquire, among other interesting objects, a valuable collection of Arabian ornaments, which forms the subject of a special report by Mr. Reginald Stuart Poole, assistant keeper of coins and medals in the British Museum. The collection consists of a hard wood (possibly walnut) pulpit from the mosque of the Sultan El-Muyeiad, at Cairo, executed about the middle of the fifteenth century, and containing some extremely elegant specimens of Arabesque ornament; some carvings from the Mosque of Ahmad Ibn Tooloon (the oldest in Cairo), one specimen being, according to Mr. Poole, of the first period of Arab art in Egypt; a very fine table, also from a mosque; an ancient piece of lattice work; and a curious Arab bed inlaid with ivory. The collection also comprises some examples in metal, glass, and porcelain, and some very interesting manuscripts.

Among additions made to the casts and bronzes in the Museum, are an electrotype of the Gate at the Baptistry at Florence, by Lorenzo Ghiberti, a cast of the great bronze candlestick in the Cathedral at Milan, casts of various works of Italian art of the fifteenth century, and of Norwegian doors of the twelfth century, the originals of which were exhibited in Paris. The convention formed by the Prince of Wales and other princes of the reigning families of Europe, is looked forward to as "the most important occurrence of the year," as a medium for the promotion of the reproduction and exchange of works of art in different countries. We put not our trust in princes, and think that art is likely to derive less benefit from the convention than the Department anticipates. We are glad to observe that advantage is to be taken of the projected authorised survey of ancient Indian architecture, to obtain casts of some of the most important monuments for the national and principal local museums of the kingdom.

The collection of photographs has been largely increased, no less than 6,694 copies having been added, including a series of portraits lent to the National Portrait Exhibitions of 1866 and 1867, and a good collection of illustrations of Indian architecture and costume. An addition of 500 books and pamphlets has been made to the library, which now possesses 20,400 volumes.

The third portion of the report, dealing with scientific institutions, recounts at some length the progress of the Museum of Geology, the Royal School of Mines, and other similar institutions. The Lords of the Committee conclude their report with a confident expression of opinion that at no period since its establishment has the influence of the Department been so widely extended or its beneficial results so marked as during the past year. They trust that the increased grants made by Parliament, supplemented by various acts of private munificence, among which is specially mentioned the magnificent scheme of Mr. Whitworth, will enable them still further to afford a knowledge of science and art to all classes of Her Majesty's subjects.

THE ART OF BUILDING IN CONCRETE.—II.—MAY'S SYSTEM.

THE method of erecting buildings in concrete, invented and patented by Mr. Tall, formed the subject of a former article in our columns. In addition to his system, there are, as many of our readers are probably aware, others differing both in principle of construction, nature of material employed, and in the character of their details. Mr. Tall's method might be described as the plan of building a house all in one piece, since there is an absolute continuity and uniformity of the component parts not obtainable by any other recognised means of ordinary building. The walls are raised *in situ*, in a fluid or semi-fluid condition, and consolidate and set during the time occupied by the remaining work to be done to the dwelling. This is the true principle of concrete, and that to which, in fact, the heading of our article ought, if stringently interpreted, alone to apply; but as the material concrete is actually used in the methods we are about to bring under consideration it may bear a more extended application. To pass on to May's block system it is nothing more than the employment of concrete bricks, instead of those made from the usual description of clays. These bricks and blocks are much larger than the common bricks, and are designed specially so as to secure an equable distribution of headers and stretchers, and thus ensure the presence of a proper amount of bond throughout the work. Now the first question that will present itself, and which must be satisfactorily answered before the plan can be entertained with reference to the building of dwellings upon a cheap scale, is, can these concrete blocks be manufactured, bulk for bulk, at a less or the same rate as bricks? Upon this point we do not think there can be any doubt. Ordinary bricks cannot be made except from certain descriptions of clay, which is not to be found in every locality; but the concrete blocks may be manufactured of almost any hard material by the aid of a small proportion of Portland cement, to constitute the binding property. Gravel of every description, provided it be not too large, broken glass, china, clinkers, furnace slag, and a host of other substances may be utilised in this manner. There is this difference between the manufacture of these blocks and bricks, that whereas in the latter instance the material is only to be obtained in certain districts, in the former, there is no locality where some ingredients would not be encountered suitable for the purpose, and, what is more, totally unsuitable for any other.

It may be, therefore, safely conceded that their first cost will not exceed that of bricks, and our opinion is that it will be found considerably less. It must be borne in mind that all these principles of building in concrete, whether the blocks be solid, as in the method now under consideration, or hollow, as in Parr and Strong's, and in another that we shall treat of in its turn, they do not require the aid of any special framework or apparatus, and are, therefore, better suited for building upon a very small scale. There would be no saving effected by erecting some dozen of houses instead of only two or three, beyond what always accompanies the execution of a large number of similar examples compared with that of a few. It is always comparatively cheaper to build upon a large than a small scale, or, in other words, the two principles of operation might be considered to resemble wholesale and retail dealing. The majority cannot afford to build upon a gigantic or wholesale plan, and therefore benefit most by any method which affects the smaller or retail mode of operations. Taking for granted, therefore, that the material is as cheaply produced as the ordinary bricks, the next question includes that of labour or workmanship. There is very little necessity to inquire very deeply into this, as it is evident to anyone who has seen the blocks under notice that they could be set and walls built as cheaply as those of brick. From their size they would require rather more care in laying, and some additional attention would be necessary in ensuring the accuracy and straightness of the joints, but these trifling details of manipulation would soon be mastered by any bricklayer who was gifted with the commonest amount of intelligence. Mr. Tall asserts that one advantage of his fluid method of building, so to term it, is that regular bricklayers are not required. Here, as we have formerly stated, we differ from him, but there is no question that common labourers would not answer for building walls of solid concrete blocks. The close resemblance existing between this description of work and that of brickwork would not allow of any saving being effected in this particular. As more work could be done in a certain time there would, of course, be a slight balance on the side of economy in this respect, but it would also take some little time for a bricklayer or a mason to familiarise himself with the sizes and shape of materials which are truly neither bricks nor stones.

A great, and, many would assert, a fundamental objection to all descriptions of building in concrete, whether fluid or solid, is the unsightly appearance the walls present. We will say nothing about the want of any architectural effect, by which is not meant, as is usually considered in this country, the mere outline or proportions of a design, but simply refer to the rough, crude, hard, and raw appearance afforded by the sight of a concrete building, in which the walls stand naked as they were built. It may be accepted, as a rule, that all concrete walls must be covered with stucco, or, as Mr. Ruskin wittily calls it, slime, with paint or facing of some sort. We do not believe that any gentleman would like to erect upon his estate a large number of dwellings presenting the cold, stony, and rough appearance which characterises concrete walls. In a word, the concrete lacks the warm tint of brick, which contrasts so well with the prevailing colours of landscape scenes If we once accept as an inevitable accompaniment to the employment of concrete in the construction of cottages and dwellings for the labouring classes, that the walls must be covered with some kind of coating, the economy of their adoption becomes a matter of considerable doubt. Even if the face work were confined to the ruling of lines to represent joints, which would scarcely relieve the natural aspect of the concrete, the labour would be equivalent to that of pointing, which is rarely done in houses of a humble description. There is another solid method of building in concrete to be described, and we shall then pass on to consider what might be called the hollow method, in which moulds are first provided, into which the concrete is poured, and then the whole built up similar to the brick work we have been noticing. The Central Cottage Improvement Society are at present putting the concrete block system to an experimental test by the erection of a couple of cottages, which we shall take an opportunity of inspecting. One actual test of this nature is worth all the surmises and opinions in the world.

DEVELOPMENTS OF NONCONFORMIST CHURCH ARCHITECTURE.—III.

WE have hitherto been concerned with the commonest arrangement in Nonconformist churches,—that of a plain oblong or rectangular plan, and chiefly with the roofing of this one. Before passing on to other plans it may be as well to say something more on internal design. The gallery, of course, is the main difficulty inside,—just as the wide roof is externally. And it is a difficulty which, even more than the other one, it has been attempted to pass over and evade. It is seldom, indeed, that it is accepted as one of the main conditions of the case, and that it is really incorporated into the essence of the design. The idea that generally suggests itself is that the gallery was forced in against the architect's will. He had built his church with long windows and tall columns to divide it into nave and aisles, he had relied for effect throughout on unbroken vertical lines,—when

suddenly the committee stepped in and destroyed them all. They barbarously cut his windows in half, and hung a system of beams and framing to the middles of his columns; they obliterated all his verticality with a horizontal feature strong enough to overpower everything. And they had not even the grace to consult him as to the least objectionable way of doing this. They made their gallery here three seats wide and there six; so that even its junction with the wall is not quite horizontal, but steps up a yard or two higher in one place than in another. Nay, the very plan of it does not fit the building. There is not a piece of circular walling about the chapel, but the gallery front, or a great part of it, is curved on plan, and has no relation whatever to the forms which adjoin it. Perhaps this last fact explains the mystery. It was not made for the chapel after all. The committee, being, as some committees are, penny wise and pound foolish, doubtless bought it cheap at a sale of old materials, and had it put up in hopes of its being an improvement.

Unfortunately the case is too common to be accounted for thus. Chapel architects must bear their share of the blame for the absence of anything like unity and architectural composition in galleried interiors. In spite of that blind adherence to what has once become customary, that unreasoning conservatism which is just as prevalent among Nonconformists as elsewhere, their architects might have done much more than they have. There is no reason why the form of gallery which happened to be consecrated in some large chapel forty years ago should therefore be inflicted on us to the end of time. Of course, innovations affecting the seating of the congregation are not to be effected without a severe fight. They involve money in the shape of contributions or pew rents, and so come to be discussed more keenly than those in mere external design. It may be a question, however, whether the sacrificing too much to money in this way is not a policy that defeats itself. It is possible to spoil a building for the sake of additional seats, and to have it half empty after all. If Nonconformists really care to have churches which are not offensive to every one of the slightest sensibility, they must be willing to lose a little for the sake of gaining a great deal. A theatrical manager may be tempted to increase his receipts even by spoiling and overcrowding his house; but such a practice is simply repulsive in a place of worship.

The first thing that is wanted in a galleried interior seems to be to make the gallery an essential part of the design, a feature which every other part points to, and without which all would be incomplete. It is to arrange the whole for the sake of the result *with* a gallery, not to copy a one-storied church and hope that the gallery, when it is inserted, will be overlooked. A very little common sense will suffice to pass a judgment on such things as long windows only built to be cut across the middle by the feature in question. One rather pities than blames these feeble attempts at a sham; it is so evident that the poor people who perpetrated them were driven to it because they could not invent anything else. Their difficulties were too much for them, they could see no other way of dealing with the subject. How unfortunate that difficulties should ever have been given to such people to conquer. But leaving for the present matters of detail like this, there are at least three ways in which the interior of a galleried building may be treated. In the first, the gallery front and the work directly above and below it are made the principal surface in the design. The walls behind them are a mere background; it is the enclosure of the central area which assumes the chief importance. This is the system adopted in theatres. In the second way, the walls of the building retain their prominence, the gallery runs round them more or less as a balcony, and its columns do not go up to carry the roof. In the third, the gallery does not project from the sides of the building. It runs across it perhaps at one end, or it fills up recesses arranged for the purpose, but it is more subordinate than in either of the previous cases, and detracts less from the apparent height and verticality of the walls. The first system, we have said, is that on which theatres are usually planned. It is the front of the boxes there which form the visible interior; the actual walls are almost or quite out of sight. It appears perhaps at first that nothing at all analogous to this treatment can be found in mediæval churches. Yet the nave arches and triforium of a vaulted building show a principle not altogether dissimilar. In certain cases (Westminster Abbey for instance) the top of the aisle vaulting has actually been turned into a temporary gallery of which the triforium was the front. And though this would be unsuitable enough for permanent use, its height from the floor, the thickness of the piers, and the multiplicity of smaller shafts all interfering with the view, yet the principle is worth remembering. *This* gallery, such as it is, is an important element of beauty. Is it impossible to keep it so, and yet remove its practical inconveniences? One thing seems certain—it must either be above or below the main nave arcade, if there is one, whether this is supported on stone or iron columns. To put up long shafts and then fix a gallery across the middles of them is a bungling expedient sure to end in failure. Half measures like this spring from incompetence, and meet with their reward. If a gallery in the position of a triforium be too high up (though it need not be so high as many upper galleries now are), the best thing would be to make a radical change, and put it entirely below the nave arcade. We are not advocating the division into nave and aisles as the best possible one. It is, however, less objectionable acoustically than is often supposed, and where, as in some of the best modern churches, it only extends to two columns on each side, it need scarcely destroy the view of the pulpit from a single seat.

HIGH ART AND THE ACADEMY.

AMONG the many difficulties to be met in the effort to mend matters artistic—and their name is certainly legion—none is greater than the *absence* of any standard authority in the shape of books or otherwise. We have standard treatises, more or less complete, of most sciences—*e.g.*, astronomy, geology, &c., from the least important to the greatest, and standard histories to refer to in case of need or doubt; but of a standard art treatise what is to be said but simply that it does not exist? If anyone be in doubt or difficulty we cannot set him right by referring him to any certain authority, but at most can but tell him to consult such and such a one on some *controverted* point of art history or practice. Nothing is apparently certain in art matters, and consequently no treatise or authority on the "Elements of Art" at present exists. This is a very great difficulty, almost impossible to be overcome, for we have no starting point, and no certain ground whereon to found anything. There is, therefore, at present no way out of this first and primitive art difficulty but to refer to the modes of action and artistic opinions, as far as they can be gathered, of the various societies devoting themselves to art in its different phases. There is no other way. For this leading reason it is that the Royal Academy system and practice of art, as a matter of original reference, will be found so useful, and will assist the student to a better and far higher comprehension of the real nature and meaning of art than would be otherwise possible. No one will of course deny the importance and interest of such an inquiry as this, for all allow there is room for improvement, and even if they do not admit this with all readiness, the results of the late competitions will prove it.

Now the very first thing that must strike anyone, when looking at art generally from this most visible point of view, is that the Royal Academy has divided art into two distinct and widely separated divisions, high art and low art, or, in more distinct and broadly intelligible terms, into art by men of the highest artistic powers, properly and fully exercised, and consequently worthy of every possible honour, and, on the other hand, into art by men of altogether infinitely inferior powers, producing only results not worth the time and trouble they cost to bring into existence, and certainly unworthy of any sort of honour or credit the Academy itself is able to confer. In short, it is everything on the one side, and nothing on the other. If this be not interesting to artists and architects nothing is.

But there is, as I have said, no test whereby to try the truth or falsity of this claim on the part of the Royal Academy to divide artists into two divisions so widely separated; no book or authoritative statement by the Academy itself defining what is high art or the highest art, and what is low art or no art. We are simply left to find it all out for ourselves as best we may. There is but one way—viz., the annual Exhibition of Paintings, Sculpture, and Architecture, and it is there that we may see the solemn facts as they really and palpably exist before our very eyesight, and every man, woman, and child may judge, each one for himself and herself. It is very easy indeed to do this, for the full academicians are a very privileged body, and have so arranged matters that all their own works and results of their own art powers are ranged, more or less together, on what is termed the "line"—*i.e.*, on the wall space on a level with the eye of the spectators, thus to be most readily and easily seen. The inferior powers are all underneath or above this magic space. I say nothing at all of those who are altogether excluded or of those who never and cannot exhibit. And what is it, then, that is to be found by anyone looking at this magic line of high art, and at the lines both above and below it? Why, simply no difference whatever. It is simply impossible for the most knowing and the keenest eye to detect any difference in *degree* of artistic power between those works on the line and those above and under it. Of course, the size of the works may differ, and the subjects of them, and the pains taken, and the time they cost to do, and a hundred other points of difference there may be; but in degree and measure of art power there is in reality none whatever. They are for the most part generally all alike—the line above is as good as the line below, and these are every way equal to the works on the line itself. There is no high or low art visible, it may be all termed middle and level art; indeed, it is something wonderful to see so many paintings all alike, and with so little difference between them in the *degree* of artistic power. I say the *degree* of art power. This fact, not a little remarkable, must, I think, have struck everyone who regularly visits the Academy exhibition, and will not therefore be disputed. I think I can see some cause for this, but let that for the present be how it may. What, therefore, becomes of the Academy distinction between high and low art, between those who are said to practice high art and those who practice low art—in short, between Royal Academicians and common outsiders? There is really none whatever, for the time would seem to have produced a number of very clever painters, all pretty much on a level, and without any one or many of supercommanding capacities of powers, and the fact really is that all these *regular* contributors, to say nothing of others, are quite worthy of the honours, such as they are, of the Royal Academy. If truth must be told, there is in this age *no high art* in the sense of the results of the highest art powers, for even when men of the highest capacity now appear on the world's stage, false and foolish education and the circumstances and pressure of the time seem to be all bent upon *negativing* their

powers. If it be a subject of art interest to inquire into the capacity and work of the workman it is not less so or less important to ask how it is that this high power is lost when it exists in the more advanced and highly educated artist. If the ignorant and the dull workman cannot do anything to render him worthy of standing inside the door of the Academy by reason of his ignorance and dulness, what is that which makes the more clear-headed and educated artist worthy of all Academy honour, but whose actual works, when produced and before the public eye, fail to satisfy the critical sense of the spectator who is looking out for *high art*, and which high art he is told is only to be found within the walls of the institution he is then walking through? These are the poles of art—the workman and the artist—the artist guiding but not destroying the individuality of the workman; and it seems to me that it will not be wasting time to inquire, very shortly, how it is that such men so highly gifted as Turner, Marochetti, and Millais, fail to accomplish what is expected of them. How is it that the dull spectator, unable to do anything himself, fails of being fully excited and gratified with the infinitely superior and higher imaginative and artistic powers of such men as these? What more does he want? What does he, the spectator, mean by high art? and how is it the Royal Academy is not confined to three or four of such men so rarely gifted, and so in real truth to confine the Academy to high art or the highest art power, whether fully and properly exercised or no? An academy on this plan all ought to be satisfied with—*i.e.*, to consist only of the very limited few in each age and generation who manifest, in promise, if not in fulfilment, the highest powers an artist is capable of. The workman is of course out of the pale; the outside artists are almost out of the question, because they have no means of manifesting their powers to Academy circles and influences. The general body of regular exhibitors are out, because they are all on a level, so selection is barely possible. It therefore, from necessity, remains with those who manifest the highest powers, although they do not realise them in practice. A few words, therefore, on what *high art* is and means cannot be otherwise than useful in a search for a new system of fine art action and practice.

C. B. A.

ORNAMENTAL METAL WORK AT THE LEEDS EXHIBITION.

Of all the ornamental art at the Leeds Exhibition, no section is so well represented as metal work. The specimens, both in the precious metals and in iron and steel, are very numerous and important; the arrangement, however, in certain cases is most eccentric. Thus in the Celtic and Anglo-Saxon section we have the (62) Limerick crozier, 1418; (63) Limerick mitre, rather later; (87) a silver brooch, fifteenth century; (38) a silver bracelet with an oval seal-shaped medallion in front, latter end of fifteenth century, supposed to have been the seal of Thomas Burton, Bishop of Sodor and Man, 1452-1480, as the inscription on it is,—S. Thome Dei gracia episcopi Mannensis: it is a very beautiful specimen of cast work, chased up and finished afterwards in the most perfect manner, rivalling the later medals by Cellini and others. It will be a good day for us when we can get such work done. In another instance, the Hunterston brooch, a magnificent specimen of the Tara brooch order, dug up in Ayrshire, is described as Saxon, and though put in the catalogue pretty near to the only similar work of consequence in the exhibition, viz., the most valuable and interesting crozier (81) belonging to Dr. Moriarty, Bishop of Kerry, Killarney, is, in fact, placed in a different room. This is a pity, as it would have been very instructive carefully to have compared the workmanship of the two, especially the beautiful filagree work of gold. We cannot bring ourselves to believe in its Saxon origin, though we do not deny the possibility of it, remembering the close connection which exists between the style of some of the finest Saxon MSS., as the Durham Gospels, and the best of the Irish. Bishop Moriarty's crozier, being externally principally of thin plates of brass, has suffered a good deal from its burial in the ground, but still it is a most important specimen, and in point of execution perfectly admirable; fortunately the filagree is of gold on silver, and so this part is as fresh as the day it was made. The shape is that of the usual Irish type, with a head something like a horse's head. The whole surface is chased by hand in the most elaborate and delicate arabesques, relieved by filagree knots of as perfect execution as the best Greek work. In execution it is unsurpassable. The processes used are perfectly applicable to other dates of art, and if carefully studied and mastered might lead to important development, and help us out of the groove we seem unfortunately to be deepening for ourselves.

There is a good collection of ordinary Saxon fibulæ and such things, but nothing else of this kind worthy of comparing with these except the bell of St. Thura, which is later outside, though it is said to contain under the silver plates some earlier work. There are many good examples of Greek gold, which are worth study. All the best Greek work must improve the taste of any man wishing to be a true artist.

By the way, we may remark that Mr. Forman's collection of Greek pottery is astonishingly good. One would have hardly expected to find such work in a private collection. Especially admirable is No. 218, a large and very fine bowl, painted red and black, with the death of Hector,—it reminds one of the finest thirteenth century work, only far surpassing it. The whole collection should be examined, especially in some of the smaller pieces, where the comic element comes out strongly. As in every collection where it has been exhibited, so at Leeds, Mr. Haywood Hawkins' Greek bronze alto relievo, parts of which were restored in wax by Flaxman, stands out as the gem. There is nothing known to compare to it. It is thought to have been the cover to a mirror, and was found at Paramythia in Epirus in the year 1798. Whether we look at the correctness of drawing, grace and elegance, or to the wonderful power of execution, it is simply perfect.

But to return to the mediæval and other metal work. Of the tenth to thirteenth centuries we have few examples of note. There is an interesting little thirteenth century bit (846) found near Oxford—the top of a pyx, with Christ holding a book in high relief, cast and chased: and two or three fragments of candlesticks, somewhat similar, though inferior to the great Gloucester candlestick, about 1100; and two or three fine seals: of the fourteenth century we have two very important examples, belonging to Mr. W. Sneyd (853 A); two gilt book covers, chased with the Crucifixion, &c.,—the word chased hardly allows one to realise the process here employed, which really was to carve in brass,—the figures are truly carved and chiselled in low relief, and then chased. The practice began in the thirteenth century in the ornamentation usually of the sides of the enamelled reliquaries, probably with the same tools that cut away the surface of the champlevé enamels. When carried to the perfection of these two covers, the art is one of rare beauty, but would be very expensive,—almost the same effect could be produced by the more modern plan (a re-invention of a very ancient art) of knocking up the back of a thinner plate (repousse) and then chiselling and chasing the front. When we come to the fifteenth and sixteenth centuries, we get numerous examples, some very fine; and in the finest examples we find none of that affectation of severity, and confining oneself to one or two processes, which so distinguishes modern incapacity. All that the old men knew they employed: and if they had lived to our day, they would, as we fully believe, have employed, as far as they are true to the principles of art, the processes of the Cinque-Cento period, and especially of the different nations of the east, who seem almost incapable, except as far as they imitate modern European work, of doing anything in bad taste.

Oxford and Cambridge contribute some of their best plate. Two very beautiful and elegant cups are shown by Corpus Christi College, Cambridge, (1502-1503): the former is called the foundress cup, and is especially valuable as a specimen of surface-engraving, wanting the hardness and stiffness of what is usually done nowadays. The other, the gift of the Countess of Richmond, (1507), is a charming specimen of low relief and elaborate chasing and stippling. There also appears to be judicious use of die-stamping—all perfectly legitimate methods of treating metal. It is by the happy combination and perfection of all known ways of treatment that we can hope for real progress in art, but unfortunately in all connected with metal work we seem incapable of learning anything but some school lessons as to some particular time. What should it matter to us whether the fourteenth century man got such and such an effect by such and such means—if we can get as good or better by an easier and less costly process? Our present designers want elasticity as much as they do art. Of this they may be assured, that eccentricity, quaintness, or even picturesqueness can never take the place of fine art, however fashionable it may be for a time. Knotches and knobs—scrolls of contorted iron wire or bar unwrought and not even decently twisted, bull's eyes and bullet holes will not much longer be allowed to make believe for art and disguise the terrible art incapacity which exists among some of the most favoured architects of the day. Try to shut our eyes as much as we like to the matter—such an exhibition as the present unmistakably thrusts it before our eyes, that there is more art power as well as executive skill in many a piece of metal of the Cinque-Cento period, or of Oriental manufacture, than is exhibited in some of the most elaborate and expensive screens and grilles of our fashionable architects. Especially admirable for execution, though late and not altogether to be admired for its shape and design, is the 1540 English gilt cup, also belonging to Corpus Christi College. In this there is a beautiful combination of casting, chasing, *repousse*, and engraving.

We must not, while speaking of the later Gothic silver work, omit to notice Lady Otho Fitzgerald's silver badge of the order of St. Agatha, with the figures of St. Peter and St. Anthony, late fifteenth century. The chasing is good, and the foliage a good instance of sigillation. Some of the boldest chasing appears in Messrs. Hunt and Roskell's Italian silver-gilt chalice, dated 1419.

For surface chasing, nothing is more admirable than some of the early medals. Mr. T. G. Parry contributes a delightful little bit (1499), a silver circular medallet, with the Virgin seated, the groundwork diapered. Nothing can surpass the delicacy of this little treasure, and no one but a first-rate artist could have executed it. We can hardly, however, trust the date given in the catalogue, the thirteenth century. It is hard to decide upon such a point without comparison, and having the article in one's hands; but it appears to be considerably later.

As we get to the Renaissance period, the subject of metal is as thoroughly exemplified as one could wish. There is a splendid collection of wrought iron and steel, especially of damascened work. Among the richest specimens of iron is the pair of late fifteenth century ambry doors belonging to Mr. Forman. They are wonderful examples of skilful superposition of different layers of metal, and of artistic beating and twisting of iron, so as almost to rival the work of the most skilled goldsmith. Of Damascene, European, and Oriental, raised and flat, we have the finest possible specimens. Of the Cellini shield belonging to Her Majesty we need say nothing, as its perfection and condition are so well known. South Kensington shows the choice steel mirror of Diana of Poictiers, for which they gave £1,281. Such a work as this of course could only be executed for the very rich, but for all that the process is quite as well worth our attention as that of enamelling, especially as used by the Persians, who grave out the surface, leaving the arabesque in low relief, and then with gold and silver damascene the projecting parts; the effect being often not unlike some of the Irish work.

From what we have said it will be seen that even from our point of view as mediævalists, the exhibition at Leeds is full of instruction; but really the great feature of it is the truly magnificent collection of paintings, drawings, and engravings, which far exceeds in many ways what was shown at Manchester.

The series begins with the latter part of the fifteenth century, and contains some of the very finest things in the kingdom from that time to the present day. Lord Dudley's pictures alone are worth any amount of trouble to see. Notwithstanding all these glories, however, there can be no doubt that the Yorkshire mind is hardly trained up to the point of appreciating the highest art. The concerts, under the able direction of Mr. Charles Halle, which are excellent, are evidently the greatest attraction; after that,

the English pictures draw the greatest attention; works of early art, either painting or otherwise, are, by the majority, looked upon merely as curiosities.—*The Ecclesiologist.*

THE BENEDICTINE MONASTERY OF CHRIST CHURCH, CANTERBURY.

At the recent annual meeting of the Kent Archæologieal Society at Canterbury, the Rev. Professor Willis read a paper on this monastery, surrounding the church, the history and remains of which he has spent many years in investigating.

The Professor said that the great Cathedral of Canterbury was originally the cathedral of a large monastery—the earliest monastery of Benedictines organised in England, and which served as a model for others subsequently established. Its founder was Archbishop Lanfranc, who, at the end of the eleventh century, was the first of the Norman archbishops appointed to rule the Saxon monastery which had previously existed here. When he came to Canterbury he found the buildings in ruins, and he caused the monastery to be rebuilt according to the arrangement of the Benedictines at that time. It was he who set out the plan of the whole, and erected all the principal buildings. A number of remains of the Norman monastery had been brought to light by the pulling down of the prebendal houses, in consequence of the number of stalls having been diminished, and the ruins were sufficient to show the extent of the Benedictine monastery. It happened, moreover, that more copious and precise records existed of the Canterbury monastery than of any other ancient foundation with which he (Professor Willis) was acquainted. By a curious accident it became known that about the twelfth century the monastery acquired a grant of that great source of water—a magnificent stream running out of the hills—which supplies to this day the whole of the Chapter land. No sooner was this spring acquired than the prior of that day, who was a competent engineer, and knew something of hydraulics, completed a system of waterworks by which the water was conveyed to the monastery and distributed through the buildings. It fortunately happened that a Norman drawing was still in existence, containing a delineation of the whole system of water pipes. This drawing, which was on vellum, had, by some mysterious agency, found its way into the Library of Trinity College, Cambridge, where it was bound up in the great Psalter known as the Triple Psalter, which was not merely a reproduction in three languages of the Psalms of David, but a collection of all the psalms contained in the Scriptures. The Nicene Creed was also included. Some leaves had been torn out of the Psalter, and this drawing inserted in their place, so that it came between the middle of the Magnificat and the Nicene Creed. The drawing, which had been beautifully executed by a monk named Edwin, was a representation of the whole monastery, and had been engraved by Virtue for the Society of Antiquaries in the middle of the last century, and published in the *Vetusta Monumenta*. Virtue, however, took great liberties with the original, and produced a very inaccurate copy. On the original drawing the description of each of the buildings and water pipes was written in contractions, and in endeavouring to enlarge these inscriptions Virtue omitted some and turned others to a different aspect, so as to destroy their archaic value. He (Professor Willis) had therefore traced a fac-simile of the original drawing with great care. The plan he held in his hand was not his drawing, but a proof of the engraving which members of the society would receive in the next volume of the "Transactions," together with other engravings illustrating the subject. In order to understand this drawing he had made as careful a scrutiny as possible of the whole of the precincts, having, by the kindness of the Dean and of the other residents, without exception, received licence to penetrate every corner of every house. He made a drawing as the result of that survey, and after extracting from the drawing all the buildings of the monastery up to the time of the Reformation, he thought the best way of interpreting the Norman drawing would be to make another plan, including only remains of buildings which were on the ground at the time when the Norman drawing was made. In doing this he produced a plan which justified in every way the accuracy of the Norman artist. (The Professor here exhibited a copy of the Norman plan, and proceeded to describe by its aid the ancient waterworks.) The water was conveyed from the spring past a conduit house through four oblong reservoirs. In travelling slowly from one end to the other of these reservoirs, one after the other, the water deposited its mud. The fourth reservoir was under the city wall, and thence the water was conveyed directly by pipes into the monastery. Vitruvius recommends that water for the supply of towns should be made to pass through "settling tanks," and the members were evidently acquainted with Vitruvius's work, and carried out his principle. Stopcocks were also known to Vitruvius, and they are figured on the plan as attached to each of the tanks. The ancient water pipes passed through a cornfield, a vineyard, and an orchard, and then through the city wall, and along the course of a lane to the monastery. Professor Willis then proceeded to give a general description of the ancient monastery. (This portion of his address will be found in our last impression.)

THE PAINTED GLASS AT FAIRFORD, GLOUCESTERSHIRE.

The remarkable series of painted glass windows in the parish church of Fairford, Gloucestershire, formed on Wednesday last the object of a special visit from the members of the British Archæological Association, who are now holding their annual meeting at Cirencester. Previous to visiting the church a sectional meeting was held at head-quarters, at which Mr. H. F. Holt, who has devoted considerable attention to the subject for some time past, was present. The windows are twenty-eight in number, and the church was built in 1498 purposely for their reception, it being stated that they had been captured by one Captain Tame, in a ship which was conveying the glass to Rome, and that he had the church built for the purpose of fixing the glass in it. The subjects depicted are taken from both the Old and New Testaments, and, the situation of Fairford being very remote, the knowledge of their remarkable excellence has been confined almost to local fame. Mr. Holt described the different subjects in detail, all scriptural; and in his remarks to the archæologists observed that their artistic interest was twofold—first, for their intrinsic merit as pictures, and that they belonged to the style of glass painting in which the mere decorative effect was subservient to the capability of conveying noble design. He believed the windows might safely be ascribed to Albrecht Durer. Mr. Holt went on to observe that they had been "restored" in a shocking manner, and as they were exposed to further deadly risk and imminent peril from the same cause, he especially desired to call the attention of archæologists to them to crave their protection. He regarded these as the most interesting series of painted windows in existence in this country. At the end of last century these windows were alleged to belong to Albrecht Durer, but the idea was pooh-poohed by Bigland in 1791. He (Mr. Holt) now appeared before them in the character of a new and independent claimant on behalf of Albrecht Durer, and as being the first person who had compared these windows with Albrecht Durer's known works. He reviewed the life of Durer, and came to the deliberate conclusion that in the Fairford windows they had the only extant remains of his mastery in the art of glass painting; and that this was the work which occupied him at a period of his life when it appeared he must otherwise have been comparatively idle. He connected Durer with these windows by tradition, by the period of time when the church was built, and by the internal evidence afforded by the windows themselves, their similarity in various respects to known works by the same hand. The building of Fairford Church was begun in 1498, by John Tame, cloth manufacturer, who purchased the manor from Henry VII. The statement that Tame captured a ship on its voyage to Rome and took the glass out of it was full of improbabilities and inconsistencies. He did not purchase the manor until after the alleged seizure of the ship, which must have been, moreover, at a time when we were at peace, and such an act would be one of piracy. Nor was painted glass so uncommon at that time that a man should build a church in the English Perpendicular style to receive painted windows intended for Rome. Then it was a fact that some of these windows had among other designs that of the Prince of Wales's plumes. But although the story of the seizure of this glass might be altogether a myth, it might conceal the truth—viz., that John Tame might have had reason for "making his soul," as the Irishman would say, and, therefore, he built the church, procuring the glass from his Low Country agents. The glass was brought in a ship to Gloucester. Mr. Holt proceeded to notice some paintings on the walls of Fairford Church, some of which he said had been recently scraped off in deference to the anti-Ritualistic feelings of certain of the parishioners. He pointed out certain peculiarities in the details of treatment and arrangement of the subjects in the windows which he recognised as being Durer's. Durer had cultivated the art of cutting in wood, and, producing a copy of the *Chronicon Nurembergens* (1493), Mr. Holt pointed out certain wood engravings there which were undoubtedly Durer's, and in which among other things was frequently used a peculiar nimbus, which was also introduced in the windows of Fairford Church. Lastly, referring to the absence of any monogram of Durer (the D being placed within the A), he observed that, to his mind, those noble works required no monogram, for he read in every part of them, as if stamped in his own hand, the signature "Albrecht Durer." This new theory was regarded with a good deal of interest by the archæologists present, though not universally accepted, Mr. Joyce, the representative of the Vicar of Fairford, stating that notwithstanding a likeness in these windows to Durer's work, he could not, after long examination of the subject, come to the same conclusion as Mr. Holt. If they were Durer's they must have been done at a very early age. He also expressed the anxiety of the vicar to protect the windows from injury and "over restoration."

DISHONEST STUDENTS AND TEACHERS

In the Blue book of the Science and Art Department, Ireland, while obtaining through many of her schools of science and art a most honourable position, has also alone to bear the obloquy of containing four schools at which dishonest attempts have been made by the students and teachers to assist each other at the respective examinations. At one school in Belfast, another in Carrickfergus, and another in Galway, the whole of the candidates' examination papers have been cancelled, and the teachers implicated disqualified from earning any payments on results for three years. The teacher of another school in Belfast forfeits his certificate for making false entries in his attendance register and claiming payments from the Department for students who never attended his class. Instances like these cannot be too severely punished, and "My Lords" have done well in every instance to disqualify both students and teachers. It would be hard indeed if the commendable efforts now being made both by Government and private persons to induce in the people of this country a love for art and science were permitted to be hindered by the base designs of dishonest and false disciples.

THE THAMES EMBANKMENT.

To whatever cause attributable, it is certainly matter for profound regret that the contractors and engineers engaged in constructing this noble causeway have not been able to carry on their work conjointly with the contractors for the line of railway which is to run from Westminster to Blackfriars beneath the surface of the granite-cased embankment. Doubtless there are reasons and excuses for the mismanagement which will necessitate the excavation and removal of a vast quantity of the "filling-in" material of the new roadway, deposited there at great expense. Excuses and "explanations" there always are in abundance when officialism finds itself brought to book. Anyhow, a blunder has been committed, which will deprive the public of the real practical utility of the road for which they have already paid for another year. The section of the Metropolitan District Railway running from Tyburnia through South Kensington, Brompton, Chelsea, and Belgravia, to Westminster, will be opened for traffic before the end of October, and this announcement has induced us to reflect that had the contractors for the railway carried on their works simultaneously with those for the embankment, we might have had the whole of the works completed at about the same time.

PERPENDICULAR CARVED WOODWORK.

WHEN the wolf and the lamb lie down together, we may expect that mechanics and the fine arts will go hand in hand, for it certainly appears that the atmosphere of one is poisonous to the other.

The Perpendicular period of architecture is an instance of this. Workmen at that time were a far more educated class than their predecessors, and the rapid advance they made in construction—judging from the many fine examples they have left us—show how eagerly they cultivated the mechanical sciences. The mason was no longer the rude carpenter, and the wood carver, falling into his own groove, would appear to have had all his work to do in oak and chestnut. The carving—so utterly different from that which went before it—was a more or less direct importation from the East. Thus we find Oriental interpretations of the poppy, pine, pomegranate, &c., as also the florid manner of grouping them, in many cases almost identical. The embroidery of the time seems little more than a reproduction of old Saracenic work. Sculpture became at length so lavish of intricate and minute ornament in its efforts to produce a richness of diaper that the whole thing appears lost in mechanical repetition. Each leaf seems the result of a given number of strokes, and the carver becomes the slave of the tool instead of the tool being made the instrument to realise his ideas. But much of the early Perpendicular decoration had a delicious simplicity about it when taken in detail, and it was not wanting in elegance in the mass. The foliated cusp (No. 3) of the lithographic illustration is a good specimen of this latter description of wood carving. No. 4, although it has too much of the tool about it, is a very lively example of the style. These, together with the bird in spandrel (No. 1), are from the collection at the South Kensington Museum. Of later work I have selected portions of two linen pattern panels (Nos. 2 and 5), taken from fragments of framing I have found in Devonshire churches. The old Puritanical pews so prevalent in the churches of this country were often constructed of the *debris* of former frames and seats. The linen pattern is a capital union of the carpenter and carver's work, requiring the utmost delicacy of section, and a rigid decision in the carving of the ends, its exquisite flatness and outline reminding one very much of Greek drapery.

The Classic art invasion does not appear to have affected wood carving so early as it did ornament in other materials, particularly in the more remote counties, for there are many beautiful specimens about of screen and tabernacle work, the date of which it would be very difficult to decide were it not that the work often ranges with or runs into building materials of a seemingly later style.

C. W. D.

CARELESSNESS *v.* "SPONTANEOUS COMBUSTION."

"SPONTANEOUS combustion" is undoubtedly a culprit in many large conflagrations. Wharfs and warehouses, wherein were stowed hemp, jute, and such like commodities, have been destroyed by his visitation. Great as is the mischief in which he has had a hand, he is made to bear the blame of a vast deal of destruction of which he has been wholly guiltless. In many fires of which "spontaneous combustion" has been assigned as the cause, the surrounding indications have been but too suggestive of incendiarism with a view to defraud insurance companies. But greatly as the work of "spontaneous combustion" has been overrated, it is now sought by some people to attribute the destruction of acre after acre of heath and wheatfields to the same agency But "combustion by the sun's heat" is in reality "combustion through carelessness." This carelessness may be displayed either by individuals (smokers of tobacco) or by railway companies (owners of locomotive engines). The tobacco smoker is most probably the culprit concerned in the devastation of many of those fields and heaths which lay beyond the reach of sparks from a locomotive funnel. But the innumerable charred and blackened fields skirting the various lines of railway are beyond a doubt owing to the emission by the "iron horse" of showers of fiery sparks. In the days when coke was the fuel used for locomotives these showers of sparks and the volumes of smoke from the funnels were unknown. The first-named cause of the destruction of so much valuable property—the careless throwing down of "vesuvians," &c., by smokers—lies with individuals to remedy by displaying extra caution. As to the railway companies, it is probable that they will only be influenced by legislative enactment. They must either be made to burn coke or else adopt such mechanical contrivances (already within reach) as will render a volcanic shower of sparks from a locomotive funnel an impossibility.

THE BISHOP OF LONDON'S MODEL DWELLINGS AT FULHAM.

THIS building, which is now being erected from the plans and under the superintendence of Mr. Seddon, architect, consists of a block of cottages containing accommodation which may be considered equivalent to thirty-one dwellings. It is arranged as follows:—The lower floor, which may be called the basement (although it is above the level of the ground at the back and is sunk only as regards the access in front), contains six dwellings, each of which consists of one living room and one bedroom, with pantry and scullery and two water-closets for common use. There are also on the same floor cellarage compartments, which are well lighted and ventilated, and capable of being employed as stores, workshops, or bedrooms, and are equivalent to three dwellings in space. The dwellings on this floor look out upon a courtyard, which is intended as a playground for the children of the inhabitants. The ground floor—reached by a few steps from the street—has the main entrance to the building in the centre, with a stone staircase descending to the basement and rising to the roof and delivering to a balcony on each floor. Access is obtained to the several dwellings from the balconies. The living rooms are situated to the back, with a southern aspect. The ground and first floor each contains eight dwellings. Of these two have a living room 17ft. by 10ft., a bedroom 13ft. by 7ft., a scullery, and water-closet. The rest have each an additional bedroom—of somewhat smaller dimensions—as well. Thus the area being the same the accommodation is slightly varied to suit different classes of occupants. Another variation occurs in the wings upon the first floor, their space being appropriated as private sleeping rooms for ten single persons in two divisions, each of which is under the control of the occupier of the house which occupies the rest of the wing. There are common lavatories to each of these collections of dormitories. The wings on the highest floor, reached by winding staircases, are similarly arranged, and in the centre part of the building are two more houses, each consisting of rooms and a scullery reached from the same staircases as the wings. The remainder of this floor is appropriated as a common laundry and drying room, together with a bath room, to which access is obtained from the principal staircase. One point which has been carefully attended to is the provision generally to each dwelling of a separate water-closet, with ventilating shaft carried up to the roof; each house is also provided with a cistern, sink, shelf, and coal bin.

For the erection and completion of the entire block, providing accommodation for what may be considered the equivalent of thirty-one families, without considering the part appropriated for washing, the contract sum is £4,404. The whole cost will be about £4,800, inclusive of architect's fees and all expenses, but exclusive of the value of the site, which in this instance is free. The cost thus amounts to about £155 per dwelling. The rental expected is as follows:—

Attics,	10 single rooms at	2s.	... £1 0s.
„	2 dwellings „	5s.	... 10s.
„	2 dwellings „	4s.	... 8s.
1st floor,	10 single rooms „	2s.	... 1 0s.
„	6 dwellings „	5s. 6d.	... 1 13s.
Ground floor,	8 dwellings „	5s. 6d.	... 2 4s.
Basement,	2 do. „	5s. 6d.	... 11s.
„	7 do. or stores „	4s.	... 1 8s.
Total			£8 14s.

This gives the yearly rental of fifty-two weeks at £426 8s., and if one-sixth of this be deducted for expense of collection, rates, taxes, and repairs, it will leave rather more than 7 per cent. as a return for the outlay, or, if an ordinary ground rent be added, it would be somewhat less than that amount.

In examining these calculations it should, however, be taken into consideration that the position of the building, close to the entrance to the Bishop's palace, and adjoining his grounds, necessitated a somewhat more ornamental character than is absolutely necessary for structures of the class. The material of which it is built is ordinary stock brick, with stone heads and sills to the windows, and red brick bands and ornamental stringcourses. The work is being carried out by Mr. Thomas Williams, of Canton, near Cardiff, contractor. We may have occasion to refer again to this building in comparison with others of the class, efforts for the amelioration of the accommodation for the working classes having at the present time a special importance.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE twenty-fifth annual meeting of the British Archæological Association commenced at Cirencester on Monday. The meeting is held under the patronage of the Earl of Ducie, Lord-Lieutenant of Gloucestershire, and the Bishop of Gloucester and Bristol. Earl Bathurst is the president, and there is a list of thirty-three vice-presidents, including the Earls of Effingham, Eldon, Mar, and Suffolk, Lord Boston, Lord Houghton, D.C.L., Viscount Andover, M.P., Sir Michael Hicks Beach, Bart., M.P, Sir C. H. Rouse Boughton, Bart., Sir Gilbert East, Bart., Sir J. Gardner Wilkinson, Bart., D.C.L., F.R.S., the Right Hon. T. Sotheron-Estcourt, Mr. R. S. Holford, M.P., Mr. A. A. Bathurst, M.P., Mr. R. H. Dutton, M.P., Mr. Godwin, F.R.S., F.S.A., &c. The inaugural address was delivered by the noble president at half-past three in the afternoon. Half an hour was devoted to an examination of the church and townhall, and at seven o'clock the dinner took place at the Assembly Rooms. Tuesday was devoted to an inspection of the antiquities of the town. The three succeeding days were devoted to excursions:—1. To Trewsbury Camp, Akeman-street, Crudwell Church, Malmesbury Abbey, Church, and Cross, Athelstane Hall, Charlton Park, ancient stones at Kemble. 2. To Ranbury Rings, Merseyhampton Church, Fairford Church, and Bibury Church. 3. To Daglingworth Church, Dunstbourne Rouse, Elkstone Church, Brimpsfield Church and Castle, and Edgworth, &c. The excursions wind up with a closing one on Saturday to the newly-discovered Roman villa at Chedworth, of which the visitors are promised a description by a competent archæologist. Chedworth Church, Calmsden Wayside Cross, and North Amry Church were also included in the last day's programme. Among the papers read were the following:—Rev. W. F. Powell, M.A., and J. D. T. Niblett, M.A., F.S.A., "On Cirencester Church;" T. Wright, M.A., F.S.A., "On the Early History of Cirencester and on the Nature and Influence of the Roman Municipalities in Britain;" H. F. Holt, "On the remarkable Painted Glass in Fairford Church;" J. D. T. Niblett, M.A., F.S.A., "Fairford Church;" J. R. Planché, "On the Earl of Gloucester;" E. Roberts, F.S.A., "On Bibury and Merseyhampton Churches;" E. Levien, M.A., F.S.A., "On Richard of Cirencester and his Writings;" Gordon M. Hills, "On Malmesbury Abbey Church and other Antiquities at Malmesbury;" T. Blashill, "On the Churches of Daglingworth, Duntsbourne Rouse, and Elkstone."

A portion of the roadway of Grafton-street, Dublin, has just been paved with asphalte, whereby noise, dust, and dirt are reduced to a minimum.

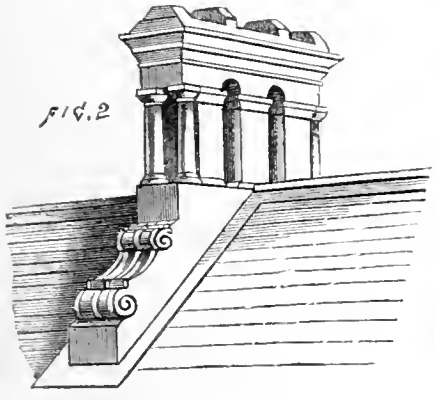
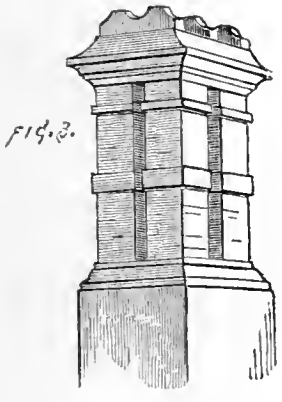
ROOF ACCESSORIES.

THE effect of wind on the stability of high chimney stacks should not be overlooked in design, as every practical man accustomed to superintend their erection must have repeatedly experienced the sensible tremor occasioned by very slight winds against wide and narrow structures of the kind. Hence the import-

ance of lateral stiffness—of concentrating the separate flues as much as possible in lofty situations, either by combining them in square stacks, or by building lateral shafts to give rigidity to a row, fig. 4. The plan of build-

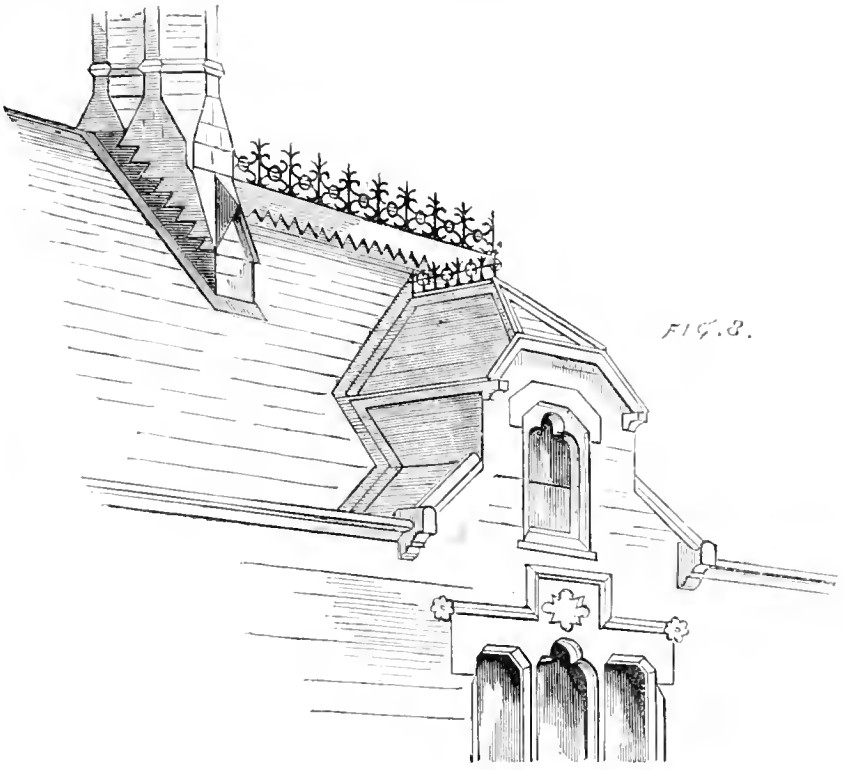


ing detached shafts, or leaving spaces between them, is perhaps the most effective way of combining strength and lightness of effect with simplicity of plan—a much more preferable mode than carrying up those huge flat blanks of brickwork that become such eyesores in large cities.

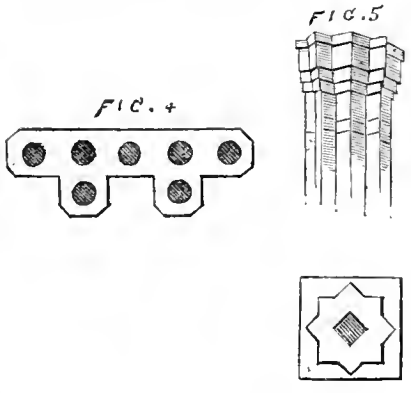


Of the many nostrums before the public for the cure of smoky chimneys it may be said that in the greater number of cases the evil is but partially remedied by the unsightly disfigurements to chimney tops, the chief cause being generally in the form of the flue or its throat, the latter being insufficiently contracted—at least, the writer's experience has decidedly been confirmatory of this view. Billing's patent termination is per-

ROOF ACCESSORIES.

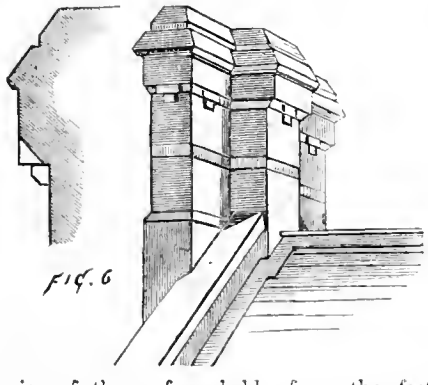


haps the least objectionable of the numerons terminals before the public. Nothing can be more hideous and often destructive to the appearance of chimney stacks than the employment of chimney pots or cowls, particularly as these after-substitutes of thought are

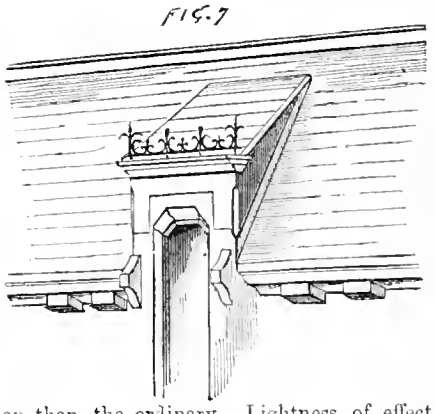


generally designed, and nothing detracts more from the look of a building than its stacks bristling with pots, like huge flat brnshes of hogs' bristles.

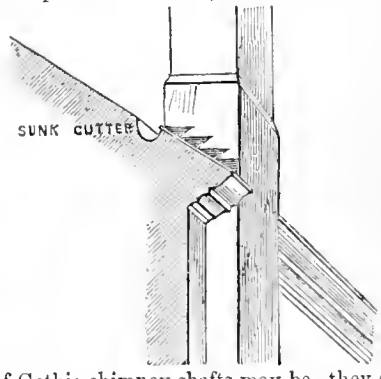
Artistically regarded, the Italians have always been "ahead" of us in these acces-



sories of the roof, probably from the fact of the clearness of their atmosphere, added to the important part the landscape has played in their architectural works. In Florence and elsewhere, examples of chimney terminations from which the smoke issues sideways under handsome sculptured ter-minals of varied design are frequent and suggestive of a new treatment, figs. 9, 10, and 11. Lateral apertures are sometimes seen among our own works, and it may be as well to note that this mode of outlet gives the architect greater scope for variety of chimney



top than the ordinary. Lightness of effect, besides another advantage, that of lessening the wind-catching surfaces of stacks, can be obtained by continuous or stopped splays to the angles, and, however unique and clever, as examples of brickwork, the fantastic shapes



of Gothic chimney shafts may be, they suffer in their acutely cut angles, the action of the elements quickly destroying their straight arrises and converting them into serrated edges. Thus, however well broken such a shaft as fig. 5 is, the plan of which is a figure of two intersecting squares, the angles wherein lies

the interest are the most exposed and the least durable in such a situation as that of a chimney; hence its unfitness.

As other examples of bases for chimney stacks in situations where they rise from the ridge or from the slope of a roof we give figs. 1 and 2, the former a treatment adapted to high-pitched roofs in the Pointed style, the latter well suited for buildings in the flatter or Italian style.

An awkward problem often presented to the architect is how to stop or interrupt his gable projections or coping for his chimney shafts, the latter being paramount. If the chimney projects as it generally does in Gothic erections, the difficulty is increased, for then the barge or verge boards of the gable must either stop abruptly or continue to a point; or, in the case of a coped gable, the shaft or stack must be of sufficient depth to stop the coping. If three flues are necessary one of them can be advantageously placed behind the other two and be made to stop the coping, as in fig 6. The same sort of difficulty more frequently arises in flank chimneys, where they interrupt the eaves' line by reason of their projection from the face of the wall. Where the projection totally cuts off the eaves, or where it obstructs all save the eaves' guttering—a not uncommon occurrence—it is far better constructively and æsthetically to form a sunk or blind gutter behind the stack altogether than to allow the mere line of guttering to cut off the stack.

Figs. 7 and 8 show designs for dormer windows, features, equally with chimney stacks, important accessories to roofs. In both cases the eaves' line is shown interrupted, and the fronts of the windows rise from the wall plane as integral parts of the structure rather than as excrescences that belong to the roof proper. In another part of our essay relating to composition, we shall have something more to say respecting roof gablets, the avoidance of little "prettinesses," and "dodges," and the pursuit of the simplest structural adaptation.

KING'S CROSS MARKET.

THIS new market, almost immediately adjoining the Great Northern and Midland Railway Stations, was inaugurated on Friday last. The new market occupies about an acre and a half in extent. It is divided into three principal areas. The general entrance is from the Old St. Pancras-road. In general appearance the market is very plain. The pillars supporting the roof are slender iron columns, painted in white and chocolate, with a band of blue round the capitals. A fountain of no great pretensions is situate in front of the retail department. Light, coolness, and ventilation are well provided for. The roof is so constructed as to shade the market entirely from the rays of the sun, while admitting a full supply of light and a free circulation of air. There are 86 stalls of shops, each having a frontage of 14ft. by 10ft. in depth. Every one of these is let at a rental of 14s. per week. Behind the fishmongers' shops are ice cellars, and above them are ranges of offices for the use of clerks and bookkeepers. The whole structure has cost about £41,000, and is let already at an annual rental of nearly £5,500.

THE ECOLE CENTRALE D'ARCHITECTURE, PARIS.

FROM Mr. Eyre Crowe's report in the "Science and Art Blue-book," lately published, we extract a few particulars respecting the above institution. Started only two years ago, it has already achieved considerable success. M. Trelat, the director, has formed around him a band of young architects, whose efforts are full of interest. The society is formed on the limited liability principle, with a capital of £16,000. The instruction is twofold—that given in the Ateliers, where the practice of architecture is taught, and in the lecture-room, where its theory is developed. To obtain admittance as a pupil a preliminary examination has to be passed, at which each candidate is required to execute a shaded drawing of ornament from bas-relief, a design (plan, section, and elevation) of some building drawn to scale from a sketch, and a written composition referring to architecture generally. He has also to pass an oral examination in arithmetic, algebra, geometry, and geography. On admittance the student has the free choice of two ateliers, taught by two different professors, with their staff of teachers. The hours of admittance are from 8.30 a.m. to 4 30 p.m, with one hour's interval. At the end of each month each student has to produce a finished architectural drawing from a copy, and one worked out from a descriptive programme. During the first two years six hours in each week have to be devoted elsewhere to object drawing. In the third year two hours a week are deemed sufficient. Each of the three years forms a class of instruction, the more advanced pupils helping by contact and counsel those of more recent entry. The advance of each student is noted with great care by a registering system, in which the whole course of every individual may be traced at a glance. During the summer vacation, which lasts three months, the students are expected to produce carefully-worked out designs of any buildings that may have struck their fancy. On the whole, each, during his three years' course, has to undergo from 270 to 280 examinations. At the end of the three years those who have given satisfactory proofs of their skill are admitted to the general competition, the object of which is the school's diploma, and which lasts fifty days. The results are determined by a jury consisting of five members or more, the public being allowed to view the designs, &c., exhibited, three days before the verdict of the jury is given. The salient features of the Ecole Centrale seem to consist in a judiciously balanced course of instruction, combined with a generous latitude of study, and the wide range of subjects descanted upon by the most competent authorities.

BUILDING SOCIETIES AND STAMP DUTIES.

IN our impression of the 24th ult. there appeared a letter from a building society's solicitor, drawing attention to a certain clause in a bill which was then before Parliament for amending the law relating to Inland Revenue. The writer expressed his conviction that if the bill was passed unaltered the effect would be to retard the beneficial results accruing from building societies. The clause referred to by our correspondent rendered all mortgages over £200 liable to stamp duty, and gentlemen learned in the law were of opinion that the ambiguous and peculiar wording of the clause rendered all amounts paid on account of mortgages liable to the duty. The building societies generally were for a long time blissfully unconscious that the bill was before the House. The Newcastle societies were the first to take the initiative, which they did by holding a public meeting and sending a deputation to London to request local members to oppose the obnoxious clause. The Birmingham societies did not begin to move in the matter until the bill had passed the Lords. Mr. Cowen and other northern members had, however, been in consultation with the law officers of the Crown, and ultimately, on the last day of Parliament, the Chancellor of the Exchequer agreed to exempt mortgages under £500, and it was promised that the clause should be so worded as clearly to exempt advances on account of mortgages. Mr. G. J. Holyoake, in a letter to the *Morning Star* on the subject, says that although it may be right, from a fiscal point of view, to modify the entire exemption from taxation originally conceded to these societies, he does not think they ought to be meddled with. Mr. Thomas Beggs, in a letter on the same subject, asks whether the societies really benefit by entire exemption from the stamp duty, and whether there is anything objectionable in principle in bringing them under the stamp duties. The question is not at this moment the amount of such duties. So long as indirect taxation must be resorted to a small stamp duty upon legal documents is a legitimate and just method of raising revenue. It is not easy to understand why a man investing his savings in the purchase of a piece of land should have to defray all the legal charges incidental to such a transaction, including a stamp, whilst the members of building societies are exempt from the stamp. Mr. Beggs can see no valid reason for giving to a number of men who may combine for the purpose of building houses and buying land privileges and immunities which are not accorded to a man who prefers to act for himself and by himself. Mr. Beggs very pertinently asks whether there is not a great mistake in assuming that there is any great encouragement given to building societies in what the legislature has done, and whether the encouragement that has been given is not more than counteracted by what has been left undone? Why should there be so much difficulty and expense in the transfer of land?

It is high time that building societies and freehold land societies were recognized by the law as commercial undertakings, and they are now large enough, numerous enough, and powerful enough to disencumber themselves of the Act of Parliament, which treats them as benevolent institutions. These societies are incorporated under the Benefit Societies' Act, 6 and 7 William IV., cap. 32; and section 4 provides that all the provisions of the Friendly Societies' Act, 10 Geo. IV., cap. 56, and the 4 and 5 Will. IV., cap. 40, so far as the same may be applicable to benefit building societies, and to the framing, enrolling, and altering the rules thereof, shall apply to benefit building societies. The Act of Geo. IV. includes the clauses which govern the rules of a building society, and the Act of 6 and 7 Will. IV. confers the ability to use them. The freehold land societies are conducting their business by an evasion of the law. It would be well, therefore, to consider whether the law, in relation to building and to freehold land societies, could not be revised and amended. It is mischievous to continue the present system, which was devised to meet exigencies not now existing. What was suited to small friendly societies becomes a check and an incumbrance to large investment societies, with incomes of from £30,000 to £100,000 per annum. Mr. Beggs would incorporate them under the Companies' Act of 1862, giving them power to purchase land, build houses, or carry out any of the purposes for which they are embodied, on their supplying the usual guarantees. He would also give to them a simple means of conveyance and transfer at a small charge. If the provisions of the Companies' Act are not wide enough they might be made so; and it would be wise that all the powers conferred upon them should be contained in one Act of Parliament.

Mr. Beggs regards the present as a proper time for the officers and members of building societies to look carefully into the matter. Possibly a conference (for which the approaching meeting of the Social Science Association at Birmingham would afford facilities) would be the best thing. A meeting of delegates might discuss such alterations in the law as appear desirable, so that the subject might be brought before the next Parliament. While not in favour of heavy stamp duties, Mr. Beggs would desire to see a small *pro rata* charge; but this should apply to all cases, whether in building societies or out of them, and be equally applicable to conveyances, transfers, and mortgages.

COMPETITIONS.

AT a meeting of the Metropolitan Asylum Board, held on Saturday week at the Board of Works' office, Spring Gardens, two lengthy reports of committee were submitted, embodying plans and arrangements for the erection of a fever hospital and small-pox hospital at Homerton. For the fever hospital it was decided to offer a prize of £200 for the best design, and another of £150 for the second best; the successful architect to carry out the plans for £1,000, but that he be not entitled to any prize or payment unless some substantial contractor undertake the work at a price not being more than 10 per cent. above his estimate of cost. Accommodation is to be provided for 182 patients. The internal dimensions of the rooms are to be such as to afford, at least, 130 superficial and 2,000 cubical feet of space to each patient. A prize of £180 has been offered for the best design for the proposed small-pox hospital, and another of £100 for the second best, the winner, as in the previous case, being bound within certain limits as to the cost of carrying out the design. The eight principal wards are to be built to contain twelve patients each, with a width of about 24ft., and are to afford 2,000 cubic and 140 superficial feet to each patient.

At a meeting of the Greenock Harbour Trust, held on Friday last, the premiums were awarded for the designs for the new docks to be built at Garvel Park. The competitors were 170 in number. The first premium (£300) was awarded to Mr. T. C. Fidler, of Ventnor, and the second premium

(£100) was assigned to Mr. Robert Kiniple, C.E., of Westminster. The plan which, in the opinion of the judges, came next in order of merit to those premiated, was that by Mr. Charles S. Beloe, of Lord-street, Liverpool.

ARBITRATION AT HUDDERSFIELD.

A MEETING promoted by the Council of the Huddersfield Chamber of Commerce, was held on Wednesday week, in the Council-room, to consider the question of establishing in the Huddersfield district boards of arbitration, to settle disputes that might arise in different trades between employers and employed. There were present representatives of the council of the Chamber of Commerce and workmen representing the following trades:—Printers, moulders, joiners, tailors, spinners, slubbers, dyers, and cloth dressers. The chairman stated that on April 8 last he received from Mr. Mundella, of Nottingham, a copy of rules adopted by the board of arbitration in that town, and the council of the Chamber of Commerce, at a meeting, recommended them to the consideration of the several trades in the district. Afterwards he received communications from the Cloth Dressers Association and others which shewed that the principle of arbitration in case of trade disputes was making progress in the public mind in this district; and the subject being again brought before the council, they decided to endeavour to bring together employers and employed, with a view to the formation in this district of boards of arbitration, which had effected such beneficial results at Nottingham, the Potteries, and elsewhere, and which a deputation from the trades of Manchester had desired the Chamber of Commerce of the city to establish there. One of the best modes of continuing and increasing harmonious feeling would be the establishment of boards of arbitration. A discussion, or rather a series of explanatory speeches, followed. All present agreed to the principle of arbitration, and ultimately the meeting was adjourned for a month, in the meantime the employers and workmen to be furnished with copies of the Nottingham rules for their consideration, and to hold meetings of each trade to consider what kind of rules would be required to meet the particular circumstances of the various trades.

SCHOOLS OF ART.

A MEETING has been held at Leith for the purpose of establishing a school of art in connection with the Science and Art Department. In Leith there was already a science school in connection with this department, which was better known as the Navigation School; but the desire at present is for an art school as well as a science school, the design of which would be to teach drawing, painting, modelling, and designing for architecture, manufactures, and decoration. Only a few townsmen attended, and it was determined to postpone the project for a year, and in the meantime to canvass for subscriptions.

ARCHÆOLOGY.

A FEW days ago two ancient swords of the bronze period were discovered beneath a rock on the brow of Simonside, Durham. They were leaf-shaped, with very small handles. One was 20½in. long; the other was broken. Some bronze rings, and two leaden ornaments, one of which appeared to be a *fibula*, were afterwards found at the same place.

The programme for the 20th annual meeting of the Somersetshire Archæological and Natural History Society is settled. It will take place at Williton on the 25th inst., and two following days. A local museum of objects of archæological interest will be formed. The first day will be devoted to business and the reading of papers. On Wednesday there will be an excursion to Cleeve Abbey, Dunster, &c., and the society will be joined by the Exeter Naturalists' Society. On Thursday the excursion will be in the opposite direction, over the Quantocks, visiting the old quarries, camps, &c.

WATER SUPPLY AND SANITARY MATTERS.

THE system of periodically watering all the narrow streets, courts, alleys, and other confined places in the parish of Marylebone with a solution of carbolic acid, and which has been going on for the past six weeks, is attended with considerable benefit; it effectually neutralises all offensive smells, and by its antiseptic properties arrests the decomposition of the animal and vegetable refuse which accumulates so rapidly in all poor and crowded localities. The disinfecting of houses in which death or sickness from contagious diseases have occurred is also persevered in; 42 houses have been thus treated during the month.

The Registrar-General tells us in his weekly report that during the month of July 113,263,837 gallons of water were supplied daily in the metropolis, rather more than a ton by weight to each house—36·2 gallons to each person.

The Rev. S. T. Nevill, the Masonic P.C.G. of Staffordshire, has broached a novel proposal. He suggests that Freemasons who have leisure should advance from the theory of their craft to practice, and, forming themselves into disciplined encampments, go out to Australia and New Zealand and build small churches in places destitute of places of worship. The Rev. gentleman has correspondents in New Zealand who have to travel fifty miles to church, and he feels certain that such a fraternity as he suggests would be welcomed in many villages as a blessing, and treated accordingly.

Building Intelligence.

CHURCHES AND CHAPELS.

On Friday last Tickhill parish church, Yorkshire, was reopened by the Archbishop of the diocese, after restoration under the direction of Mr. John Athron, of Doncaster.

Kildale parish church, Cleveland, Yorkshire, has been rebuilt, and was opened by the Primate of England on Monday week. The style is Early Geometric, and it is built of local stone. It consists of nave, chancel, and north aisle, with a tower 66ft. in height. The cost was about £2,000. All the stone being presented by a parishioner a considerable item of expense was avoided. Mr. G. F. Jones was the architect.

The new church of St. Lawrence, Stroud, Gloucestershire, was consecrated on Tuesday week. The edifice is partially erected on the foundations of the old church. The plan comprises nave, aisles, transepts, sanctuary, chancel aisles, sacristy, and porch, and is parallelogram in shape, the length being 101ft. by a width of 66ft., with projections for transepts, porch, and sanctuary. The nave is divided into four bays, each 13ft. wide, with wider arches at the intersections of the transepts, equal to the width of two bays, making the nave six bays long in appearance. Above the nave arches is a clerestory, with triplet lights. In the spandrels of the large arches opening into transepts spaces are reserved for carved medallions. The sanctuary is separated from the nave by a low stone screen and grilles, and is 27ft. long, and the same width as the nave. The eastern window is five-lighted. The steps of the sanctuary are of polished Devonshire black marble, and the floor is paved with encaustic tiles. The walls are lined with the old "bequest boards." The old tower and spire remain. Accommodation is provided for 1,200 persons, the cost being over £7,000. The roofs are of English oak, covered with plain Staffordshire tiles, with earthenware ridge cresting. The walls are built of Bisley stone, faced internally with Painswick. The dressings are of Bradford stone. The seats and desks are of English oak. Messrs. Wilson and Willcox, of London and Bath, are the architects, Messrs. Wall and Hook, of Brinscombe, being the builders.

The Countess of Huntingdon's Chapel, at Ashbourn, Staffordshire, is about to be restored and improved from plans by Mr. Sugden, of Leek. Messrs. Stonier Brothers, of Rochester, are the contractors. The cost will be £620.

The Methodist New Connexion Chapel, Sheriff-hill, Gateshead, has just been reopened after undergoing considerable alterations. The work has been carried out from the plans of Mr. Thomas Reay, architect, Newcastle, at a cost of £200, the principal contractors being Messrs. Metcalfe and Arnell, and Mr. Southern.

The contract for the enlargement of the Independent Chapel, Wells, Norfolk, has been taken by Mr. Thomas Spinks, builder, and will be carried out from the plans and under the superintendence of Mr. Darken, architect.

On Tuesday week the fine old parish church of Brampton, Derbyshire, was reopened after restoration. The church, which is dedicated to St. Peter, was partly rebuilt in the latter part of the fourteenth century upon the foundations of its predecessor, which was of semi-Norman character. The tower has been thrown open to the church. The roofs of the nave and south aisle, and the chancel aisle, have been restored, and the church re-pewed. The cost of the works was about £1,000. Mr. S. Rollinson, of Chesterfield, was the architect, and Mr. Marriott, of Staveley, the builder.

The foundation stone of a new Roman Catholic Church at Sunbury was recently laid. The entire length, including the chancel, is 84ft., and the width 24ft. The style is Gothic. Mr. Charles Buckler is the architect, and Messrs. Castle (Sunbury) and Whittle (Twickenham) the contractors.

The foundation stone of a new Presbyterian Church was laid at Eldad, near Plymouth, on Monday last. The dimensions of the edifice will be 100ft. by 55ft., and accommodation will be provided for 1,200 persons. The style is Italian, and the cost, including schools, will be about £4,200. Mr. J. L. Hodge, of Plymouth, is the architect, and Mr. Walter Lethbridge the contractor.

Linton parish church, North Devon, is about to undergo restoration. A new chaucel will be erected. Messrs. Oliver and Sons, of Barnstaple, are entrusted with the execution of the works, under the direction of the architect, Mr. Edwin Dolby, of Abingdon, Berks.

BUILDINGS.

The old tumble-down and wretchedly inadequate Clerkenwell workhouse, situate in Farringdon-road, is to be rebuilt at Upper Holloway.

No one who has been accustomed to scan the pages of publications especially devoted to mechanics and the applied sciences can fail to have remarked that as soon as any invention of great utility had been fully developed and was working successfully a greater or less number of claimants for the honour of the invention would spring up. Great public works, of course, are not exempt from this rule. The *Times*, in a notice of the Thames Embankment the other day, said that "to Sir Frederick Trench and Mr. Martin is due the first conception of the Thames Embankment." The next day letters in the *Times* claimed this honour for Mr. William Paterson (the founder of the Bank of England) and Mr. Frederick M. Eden.

Messrs. Hill, Keddell, and Waldram are the contractors for the erection of the buildings at the corner of the iron bridge over Farringdon street, in connection with the Holborn Viaduct.

Extensive alterations and additions are about to be made to Paddington workhouse. A new dispensary and a relieving office will form part of the plan. The contemplated outlay is £11,300.

An additional suite of rooms is in course of construction on the garden grounds south of the Athenæum Club, Waterloo-place, Pall Mall.

At the last meeting of the St. Luke's Vestry it was announced that the Metropolitan Board of Works have agreed to carry out the widening of Wilderness-row, leading from Goswell-road, to St. John-street, Clerkenwell. A new road, in continuation of Wilderness-row, will be carried through Clerkenwell into Holborn, and thus one continual thoroughfare, viâ Old-street and the New road, will be made from Shoreditch Church to Holborn. The new road will be 50ft. wide. This will be a great metropolitan improvement.

Several dwellings and cottages are now being pulled down in Duke-street, Norwich, for the purpose of erecting lecture, school, class-rooms, &c, in connection with St. Mary's Baptist Chapel. Mr. Edward Boardman, the architect, has adopted the Italian style,—front to be faced with red brick; stringcourses, dressings, &c., moulded white brick. The tender of Messrs. Brown and Bailey has been accepted.

TO CORRESPONDENTS.

NOTICE.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

TO OUR READERS.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

RECEIVED.—T. K.—I. P. S.—O. W. D.—I. A.—J. C. J.—R. R.—I. S. D.—H. L.—I. M. D.—E. C. and Sons—F. C. B.—I. A. H.—F. W. R.—G. E. S.—G. H. G., "Internal Decorations," by "A Subscriber"—E. C. B.—W. S.—P. J. and Co.—F. L. C. B.—I. C. J.—T. T.—W. B., "A Young Decorator."—W. S.—I. C.—I. B.—W. W.—E. C. B.—I. W. H.

F. A. K.—Enough has been said on the Walworth Common estate competition for the present.

I. P. S.—"Macon."

J. W., Cardiff.—The students' designs, &c., can be seen at the South Kensington Museum on Mondays, Tuesdays, and Saturdays, from 10 a.m. to 10 p.m., gratis, and on Wednesdays, Thursdays, and Fridays, from 10 to 6, on payment of 6d.

Correspondence.

WALTON AND WEST DERBY SEWERAGE —LIVERPOOL.

To the Editor of the BUILDING NEWS.

SIR,—You notice very briefly, but fairly, certain statements by Messrs. Reade and Goodison, relative to proposed works of main sewerage and sewage utilisation near Liverpool, for the adjoining townships of Walton and West Derby. I am not

going to argue the whole case over in public, but simply to state a few facts.

Walton and West Derby are to the east of Liverpool, which is on the eastern bank of the River Mersey. The natural drainage of Walton and West Derby is northwards by the sluggish River Alt. Liverpool and the townships named have an elevated dividing ridge nearly north and south, with, on the Liverpool side, a short cross valley line to the River Mersey by Rimrose Bridge. Sewage from Walton and West Derby may be dealt with in several ways. There may be a main sewer along the natural valley line of the River Alt to the Mersey, or there may be a tunnel sewer to the River Mersey at Rimrose Bridge, as adopted by the West Derby Board. Both these routes have been examined by the surveyor and chairman to the West Derby Local Board, assisted by the late W. Stubbs Plans, sections, and estimates have been most carefully made, not in any hurry or with any bias one way or another, but with deliberation and forethought to work out that plan which should be most economical for the township under all contingencies now and in the future. I may state that the late William Stubbs had made main sewering a study. The surveyor to the West Derby Board is an able man, and the chairman is one of our most eminent contractors for railway and other engineering works. These gentlemen, as the result of all their labour and knowledge, deliberately recommended the Rimrose Bridge outlet as in every engineering respect the best, safest, and cheapest, both in first cost and in prospective contigencies. Messrs. Reade and Goodison, as engineers for the township of Walton, devise a scheme of main sewerage for that township, and make utilisation of sewage the keynote of their plan. There must, however, even in this case, be outlets for flood waters; these are to be into the sluggish River Alt, and so to the River Mersey. Part of the area of Walton is to be sewered by pumping, and the entire sewage is to be dealt with partly in depositing tanks and partly in irrigation.

Both boards voluntarily consulted me as to their proposed works, and after due consideration I have recommended the Rimrose Bridge outlet as cheapest in first cost, the shortest line to deep water in the River Mersey, and as giving a permanent means of escape from contingent, legal, and other difficulties from sewage contamination now and in the future. Liverpool is growing at so rapid a rate that no man can predict how far the suburbs may extend, or the prices land may rise to for villa purposes, and sewage farming beyond a township boundary will not in most cases be desirable. Messrs. Reade and Goodison have, however, so read up this sewage utilisation question (and it has simply been reading) that they will take no other view. Walton and West Derby must either irrigate land in the district (one square yard of which has not been treated for), or they give the alternative of sewage tanks and disinfection of sewage. Sewage tanks and disinfection works are, so far as yet used, costly abominations, but, nevertheless, there are many places where they must be adopted if sewage cannot be wasted, as at Rimrose Bridge, which is direct into the River Mersey, and will be without injury to health or to property.

Sewage irrigation is the only true use for town sewage with any chance of paying, but there are many places where even irrigation cannot pay the town, and yet it will be the best alternative for the ratepayers. But because this is so, must local difficulties and costs be added to by making it imperative to utilise sewage under all conditions? Must it be a crime to waste sewage in any case? Will it be a crime to waste the sewage of West Derby, as the local board have decided to do? These are questions deserving of due consideration, because, if it can be dictated that under no such conditions shall sewage be wasted, as it is termed, Liverpool, Birkenhead, and scores of other places on the seashore or margins of large rivers must be compelled to close up their main sewer mouths, only using them for storm waters, and pump their sewage inland to utilise it by irrigation, no matter at what relative cost. The one proposition will be as reasonable as the other, but both are most unreasonable. Even in the case of town sewage "the value of a thing is just whatever it will bring," and if it saves money to waste sewage, then, according to the law of political economy, wasted it must be.

Messrs. Reade and Goodison, in their review of my very brief report to the Walton Local Board, treat me with more than disrespect. I am accused of having altered my opinions, or of saying and writing contradictions on this question of sewage utilisation. I maintain that my views are what experience has made them, and that they have been honestly expressed in this case. But, supposing I have altered in opinion, is this a crime? Messrs. Reade and Goodison submit their plan voluntarily for my opinion. I give it; and, because it is not such as they wished to have, I receive what I can only call professional abuse. I would rather have reported in favour of sewage application, but preferred to report that which I considered for the truest interests of the ratepayers.

ROBERT RAWLINSON.

ORIGIN OF THE POINTED ARCH.

SIR,—Without at all wishing to question the originality of the views put forth by M. Viollet le Duc with respect to the "origin of the Pointed arch," I must beg you to allow me to inform your correspondent of last week that in a lecture which I delivered to the Cambridge Camden Society, at Cambridge, in 1840, I not only gave the same reasons as those more recently urged by M. Viollet le Duc, in his *Dictionnaire Raisonné*, as among the *probable* causes of the introduction of the Pointed arch, but I proved—I think beyond a doubt—that its adoption by the builders of the twelfth century was due to those causes alone.

As this proof depends upon the citation and description of a large number of buildings situated in different parts of Europe, and as I have had many subsequent public opportunities of enforcing and enlarging my views on this point (as at the annual meeting of the Royal Archæological Institute at Winchester, in 1845, and at Chichester, in 1853; and at that of the Archæological Association, at Lancaster, in 1850), I will not occupy your space by repeating it; but, as the value of a theory depends much upon the extent to which it is examined and tested by others, I will take this opportunity of summarising the considerations which brought me to these conclusions twenty-eight years ago, and which subsequent experience and observation have abundantly confirmed. They are as follows:—

1. That there is a tendency in circular arches of large span to become depressed at the crown, and to lose their form.*

2. That depressed circular arches of the Romanesque period still remain in all parts of Europe.†

3. That the builders of the twelfth century discovered and applied a remedy for this inherent weakness of the circular arch by raising and slightly pointing its crown.

4. That a considerable number of the early *imperceptibly-pointed* arches, as Dr. Whewell calls them, of the Transitional period are thus formed from one and not from two centres.

5. That the true pointed arch, drawn from two centres, when first introduced, was used, not as a matter of preference, but as a matter of necessity and for purposes of utility, and that for this reason it was at first used in *arches of construction* alone, or those in which, as being essentially portions of the fabric, the stability of the building was involved, such as the pier arches, vaulting arches, and the great arches of the crossing; whilst in the *arches of decoration*, or those which only pierced or ornamented the walls, such as those of windows, doorways, and arcades, the circular arch was, as a matter of preference, retained.

6. That, in buildings erected during the first half of the Transitional period, the arches of construction were invariably pointed, and the arches of decoration circular.‡

I think it will be admitted that if these six propositions, or even if only the two last, can be maintained, the question as to the true cause of the adoption of the Pointed arch in Christian architecture may be looked upon as settled. The proofs which I already possess of their correctness, and which are derived wholly from buildings which I have myself visited, are too numerous and too conclusive to permit me to entertain any doubt on the subject; and I only regret that, for the reason I have already given, it is impossible for me to do justice to them in a communication like the present one.—I am, &c.,

EDMUND SHARPE.

* The reasons for this weakness are almost too obvious to require mention, but I may observe that the opposite sides of an 18in. voussoir of a circular arch of 15ft. radius (conditions by no means uncommon in the transverse vaulting arches of the Romanesque period), are so nearly parallel that with the broad mortar joints then in use it is not difficult to understand why so few circular arches of that date retain at the present day their original form, especially when we bear in mind the difficulty which these builders had in carrying up a sufficient abutment to so great a height.

† The chancel arch of Elkstone Church, in Gloucestershire, is a well known example of such a depressed arch in this country, whilst Laach Abbey, which was illustrated in your last number, and in which the whole of the transverse vaulting arches of the nave are similarly depressed, is a good German example.

‡ In the second half of the Transitional period, this rule was less rigidly observed, the pointed arch making its appearance frequently in arches of decoration, and the circular arch being found again occasionally in the arches of construction.

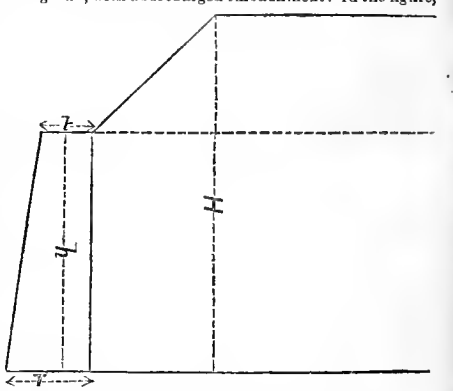
Intercommunication.

QUESTIONS.

[959.]—BLACK VARNISH FOR IRONWORK.—Can you recommend a good sightly black varnish for ironwork—one that will not lay on too thick, or take too long drying, or peel off?—F. SEAWARD.

[960.]—GOTHIC ARCHES.—I have a large job, in which I have to construct Gothic arches, circular on plan and circular on soffit. I would feel grateful to any of your numerous correspondents for information as to the manner of preparing moulds for the working of same on approved principles."—CLERK OF THE WORKS.

[961.]—RETAINING WALLS.—Will any correspondent oblige by informing me of a simple and accurate method of finding the thickness required at top and bottom of a retaining wall, with a surcharged embankment? In the figure,



let H be total height of the embankment; *h* that of the wall; *s* the ratio of the base to the height of the bank, the slope; W weight of a cubic foot of the embankment; *w* weight of a cubic foot of the wall; *b* the batter of the front of the wall when the back is vertical; and *b* and *b*¹ that of the front and back, when both batter. Is it best to calculate the thickness of the wall first for exact equilibrium, and then multiply by 2 or 9-4ths for stability, according to Vauban and Hann? For simplicity sake, I have shown the foot of the embankment resting against the edge of the wall, and not on the top.—X + Y.

[962.]—ST. PETERSBURG STANDARD DEALS.—I wish to ask what is the meaning of St. Petersburg standard of deals? Whether it is 120 deals 12ft. long, 9in. by 3in.; and whether planks that are 11in by 3in. are reduced to that, and all under 9in. by 3in. added. I was at the Baltic sale room a few days ago, and found they were selling deals at from £6 to £8 per St. Petersburg standard, which I thought was very cheap, if they were 120, 12ft. long, 9in. by 3in.—BUILDER.

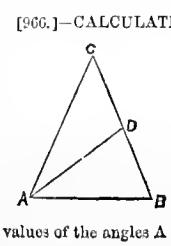
[963.]—WEIGHT OF FLAT AND ROUND WROUGHT IRON BARS.—Having been brought up in early life to hard work, I had no time to learn; it was all work from morning to night with me. For a few years past I have had the fortune to supervise works, and often when making my inspection I am puzzled to ascertain the weight of (say) a flat wrought iron bar 36in by 2½in. by 5-16in., and (say) a round wrought iron bar 39in. 2-16in. long by 1 3-16in. diameter. I can make it up by Mr. Hurst's book, but I cannot always keep it about with me. I shall feel grateful to some kind subscriber who will show me how to work by simple rules the above dimensions.—COLD BLAST.

[964.]—NORMAN SHAW'S VIEWS AND DETAILS.—I recently purchased Mr. R. Norman Shaw's "Book Views and Details from France, Italy, and Germany," dated August 1, 1858. There being no letterpress with it, I shall be glad if some kind subscriber can inform me the price, and where I may obtain printed matter on his beautiful illustrations of his book?—PROVINCIAL.

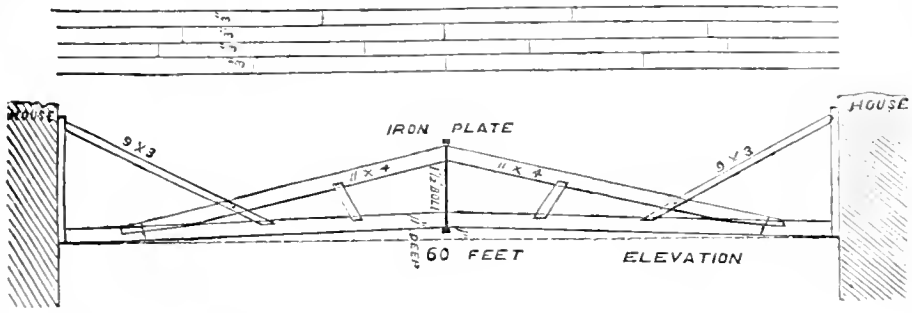
[We believe there is no descriptive matter published with this book.]

[965.]—WOODEN PILLARS.—Will any of your correspondents inform me of a rule to calculate the strength of wooden pillars, and whether a round or square pillar would be the strongest?—QUERY.

[966.]—CALCULATION OF A TRIANGLE.—I should be greatly obliged to you if you could procure me an answer to the following problem, which I have made several attempts to work out, but have not been able to succeed. In the figure, A D is equal to 725ft.; the angle A D C is a right angle; and the line B C is bisected in D. The distance A C is 1,140ft. I want to find the lengths of the lines A B and B D, and the values of the angles A B D, D A B.—TRIGONOMETRY.



SHORING-UP HOUSES. (956.



[967.]—FRICTION OF WATER.—Allow me to ask, through your valuable columns, what is the loss of velocity undergone by the water flowing in a pipe from the friction along the bed and side. How should I calculate what diminution would take place in the velocity, and consequently in the discharge also of water flowing for three miles through a 9-in. pipe.—HYDRAULIC ENGINEER.

[968.]—PUBLIC WATER-CLOSETS.—One of your correspondents refers to public water-closets used at Derby, where a flushing apparatus is applied to cleanse them. It would be a valuable contribution to our knowledge on such matters if he would give us a description of the construction. Are they on the principle of the cabinets, of which there are very many in Paris, and some few in Brussels?—A.

[969.]—WINDOW SASHES.—Can you inform me whether there is any improved means of lowering and raising sashes of windows, so as to supersede the rope and pulley, and where such may be seen in action?—TIM.

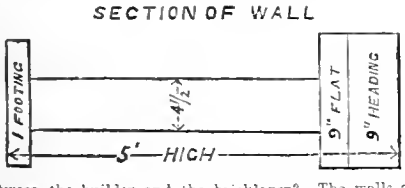
[970.]—RUSSIAN MOSAIC WORK.—Can any of your subscribers give me some particulars respecting the manufacture of Russian mosaics?—B. F. L.

[971.]—THE ARTIST "ECOUT."—Could you tell me whether "Ecout" was an artist of any particular merit? I have a painting done by him, and I should feel obliged if you could answer the above for me.—A SUBSCRIBER, Batley.

[972.]—CHARCOAL ON LEAD.—Will you kindly inform me, through your valuable paper, whether a layer of charcoal placed in the bottom of a cistern *lined with lead* would act upon the lead, and so make the water impure and unfit for drinking; or would it have the contrary effect, and act as a filter, and help to purify the water?—AN OLD SUBSCRIBER.

[973.]—MEASURING GARDEN WALLS.—Would you kindly inform me in your next the proper way to measure garden walls of this description, so as to be impartial

SECTION OF WALL



between the builder and the bricklayer? The walls are built with 14in. piers, 12ft. apart, and are struck jointed on both sides.—G. S. E.

[974.]—PAINTING COPPER GUTTERS AND ROOFS.—Is it essential to paint copper gutters and copper sheeting of roofs?—RED LEAD.

[975.]—NATIONAL ART TRAINING SCHOOL.—Can you inform me what are the fees payable by the general public at the National Art Training School at South Kensington, and whether admission is easily obtained?—J. S., Lambeth.

[The whole course of instruction in the training school is open to the general public, whether preparing for the art profession or amateurs. The year is divided into two sessions of five months each; the fees are payable either for two, three, or five months. By the artisan class only a monthly fee may be paid. Fees for classes studying for five whole days, including evenings, £5 for the session of five months, £4 for three months, £3 for two months. For three whole days, including evenings, £4 for the session of five months, £3 for three months, £2 for two months. For the half day, morning or afternoon, £4 for five months, £3 for three months, £2 for two months. To all these classes an entrance fee is required of 10s. Evening classes, male school, £2 per session; artisan class, 10s. per session, 3s. per month. Female school, £1 per session, three evenings per week.

[976.]—WATERTIGHT JOINTS.—I am told on good authority that glue boiled in linseed oil makes a watertight joint. I have tried to make it, but it comes too streaky to use. Can a correspondent set me right in the matter?—C. E.

[977.]—BRICKWORK.—What is the difference between the "Flemish" bond and the "English" bond in brickwork?—AMATEUR.

[978.]—HOLLOW WALLS.—I am about to build some cottages at the seaside, and it is essential to have hollow walls, but the cheap nature of the work precluses the use of copper or galvanised iron ties. Can any practical reader of "Intercommunication" inform me of a cheaper method of accomplishing the object desired?—W. B. T.

REPLIES.

[937.]—GAUGED ARCHES.—If the bricks be rubbed to the proper form they may be set with putty alone. If of a red colour, the joints should be set with white putty, which will have a very pleasing effect.—S. Y.

[943.]—CISTERNS.—Cisterns lined with lead are always dangerous, most waters having an action upon the metal. Slate is the best material, and should in all cases be used where the water is wanted for drinking and culinary purposes. Where slate is not used, galvanised iron cisterns will be much better than cisterns lined with lead or zinc, and these can be made to any size. D.

[944.]—WATER COLOUR.—"Student" can obtain what he requires in an excellent little work to be had from Windsor and Newton, of Rathbone-place, High Holborn. I think it is written by Aaron Penley, who is also the author of some capital treatises for beginners upon drawing and perspective.—LANDSCAPE.

[950.]—ART STUDENTS AT SOUTH KENSINGTON.—In reply to "A. F. G." I beg to inform him that in the national competition at South Kensington, the only conditions are that the student be a member of some school of art or night class in connection with the Department of Science and Art. There is no limit to age, and the drawings are to be prepared under the supervision of the master. He will also have to pass the second grade examination, but I believe it is not essential.—YORKSHIRE STUDENT.

[951.]—ROOF OF NORWAY AND CHRISTIANA SPRUCE.—The sketch is very imperfect, no purlins are required whatever. Your roof could be formed of 4 by 2½ framed couples and 6 by 1½ collar ties. "Enquirer" should give an architect 10s. 6d. for a sketch of purlin roof, or purchase Peter Nicholson's work on "Carpentry." Such simple questions as these should not occupy valuable space in the BUILDING NEWS, as they require a lengthy reply. Sick patients should employ a physician.—JOINER.

[952.]—AN OVERLOOKED EXHIBITION.—"Subscriber's" remark is very good. The illustration, with details, in BUILDING NEWS would be very interesting, and more particularly if it is in the (right) Gothic style. I have never seen any chimney shaft, or stalk, built only upon the circular or octagon plan, with common brick heading. Some time since Mr. Vale promised to give further report of his Smoke Tower, then in progress. An illustration, with details, of this, too, will be very acceptable.—F. H. D.

[955.]—STANDARD CHAINS.—The standard chain used in France which answers to our Gunter is what is called the "Décametre," or literally ten metre chain. Since 1 metre = 3.28ft., the length of the French standard chain will consequently be 10 × 3.28 = 32.8ft. This chain is unquestionably much too short, and possesses all the disadvantages belonging to that feature. The shorter the chain, therefore, the greater the number of shifts, or the greater the number of individual measurements to be made in measuring a long line. As every shift is attended with a small error, it is evident that at the end of a mile the error in chaining will be in the exact ratio to the number of different times the chain has been stretched; that is, the error in any given length will be concisely as the length of the chain.—SURVEYOR.

[956.]—SHORING-UP HOUSES.—I beg to give "Contractor" my opinion in the matter. He states in his question he cannot get balks 60ft. long. I should recommend him to bolt four plank deals together, with heading joints accurately fitted, but must be alternated, which I have shown in section No. 1. The elevation shows a truss girder, with a camber of 1S. If this plan is carefully constructed I think this will answer for all "Contractor" requires.—A BROTHER CONTRACTOR.

STATUES, MEMORIALS, ETC.

On Saturday a return was published of the public statues or public monuments in London belonging to the nation, exclusive of those in palaces other than St. Stephen's Hall, or in other parts of the Palace of Westminster, or cathedrals, and now under charge of the Commissioner of Works; specifying the dates of erection and names of artists, and from what funds purchased or erected. The statues are those of Sir J. M'Grigor at Chelsea Hospital, Sir John Franklin at Carlton House-terrace, Sir C. Barry, Westminster Palace, and King James I., Charles I., Charles II. (in plaster), William III., George IV., and William IV. The last five are in Westminster Hall and described as "unfinished." The statues of Sir John M'Grigor and Sir Charles Barry were paid for by public subscription; the others by parliamentary grants.

The strike of the masons at Halifax is practically at an end. Most of the masters have conceded the advance of 2s. to the men, making the wages 30s. a week.

BUILDING AND LAND SOCIETIES.

THE twenty ninth half-yearly general meeting of the shareholders of the Lands Improvement Company was held on Saturday at the company's offices, 3, Parliament-street, Westminster; Mr. W. Wynn, M.P., in the chair. The report of the directors stated that the new business for the half-year amounted to £116,921; the outlay by land-owners to £15,901; the commission and interest earned to £4,501; and that, after paying and providing for all current expenses, there remained a net profit for the half year of £1,689, which, with £129 carried forward from the half year ending December 31, 1867, made a total available balance of £1,818; the reserved fund on the interest account was £1,110; the general reserve fund £1,471; and the preliminary expense account amounts to £4,458. The directors recommended that a dividend at the rate of six per cent. per annum should be paid for the past half-year on the paid up capital of the company, free of income tax, and payable forthwith, and that a bonus at the rate of 2 per cent. per annum shall also at the same time be paid for the past half year on the paid up capital of the company, free of income tax, and payable forthwith.

An extraordinary general meeting of the Suburban Village and General Dwellings Company (Limited) was held at the Guildhall Tavern on Monday evening, Mr. C. Palmer, a share older, in the chair. The report of the shareholders' committee was read, from which it appeared that the petition to wind up the company had been dismissed, and that through the influence of Mr. W. G. Habershen the estate at Loughborough Park had been secured with the addition of a road at the farther end, rendering it as desirable an estate as could be procured for the purposes of the company. Four new directors, viz., Messrs. W. G. Habershen, Basil Woodd Smith, J. Faithful Fortiscue, and C. J. Cooke were unanimously elected. Votes of thanks were passed to Mr. W. G. Habershen for the valuable aid rendered the company in its emergency, to the committee for their labours, and to the officers of the company for their perseverance in conducting the affairs of the company under very trying circumstances. The meeting being made special, clause 52 of articles of association was altered, and clause 70 expunged. After some observations expressed of the conviction that the company must be a success, the meeting was dissolved.

The annual meeting of the Sheffield and North Derbyshire Building Society was held on Monday, at the Cutlers' Hall. From the financial statement of the society's affairs which was read, it appeared that a considerable amount of business had been transacted, £14,000 having been advanced on mortgage during the past year, making a total amount advanced since the society's existence of £41,000.

LEGAL INTELLIGENCE.

An action, arising out of the religious disturbances at Ashton, has elicited an important ruling from Mr. Justice Hannen at the Manchester assizes. The action was brought against the inhabitants of the Salford Hundred, to recover damages for the injuries done to St. Mary's Roman Catholic chapel and priest's house, at Ashton, during the riots of May 10 and 11. The judge held that the plaintiff could not recover unless he could prove that there was a felonious intention to destroy the chapel. If that was not what the rioters meant to do, the Hundred was not liable for the mere mischief done. The jury, therefore, returned a verdict for the defendants.

ACTION FOR TRESPASS AGAINST A LOCAL BOARD.—ALMOND V. THORNLEY, CLERK OF THE FARNWORTH LOCAL BOARD.—This was an action for trespass against the clerk to the local board for flagging, paving, and turning into the street, in 1864, a piece of ground 4ft. wide, which was claimed by the plaintiff. Several points were taken for the defendant—viz., that in 1866 local boards were made corporations, and, therefore, actions no longer lie against the clerks but should be brought against the local boards themselves; that notice of action was not given within one month, nor the action brought within six months of the trespass; and that the plaintiff, having been a member of the board and agreed to the resolution ordering this ground to be paved, had given leave and licence. In the end a verdict was taken for the plaintiff, subject to a special case.

THE VALUE OF LAND IN WESTMINSTER.—At the Guild hall, Westminster, on Tuesday, in a compensation case in which the claim was £24,600—"The Emanuel Hospital *v.* the Metropolitan District Railway"—some evidence was given on both sides on the value of land in Westminster. Whilst on one side the estimate was £22,000, on the other side it was about £8,305, with the 10 per cent. for compulsory sale. The land was in Victoria-street, and the charity was the gift of Lady Dacre, in the reign of Elizabeth, for the support of aged men and women, and for educational purposes as to the youth of both sexes. Mr. Lloyd and Mr. Thrupp were for the city of London, as governors of the charity. Mr. Hawkins, Q.C., and Mr. Stretten were for the railway company. After an investigation of two days before Mr. Toogood, the deputy high bailiff, and a special jury, the sum of £10,475 was assessed as the value of the land required by the company.

Our Office Table.

At the request of the Council of the Royal Scottish Society of Arts, Mr. Buckmaster, of the Science and Art Department, is about to lecture in various towns which he has not yet visited on the aid which the Department is prepared to give towards the scientific education of artisans. The leading men in a considerable number of places have earnestly taken up the matter.

The Liverpool Town Council, at their meeting on Wednesday, sanctioned the plans for a new local gallery of art, to cost not more than £10,000.

Mr. Greenstreet, late of the Chatham Local Board of Health, has been elected, out of forty-seven candidates, to the post of surveyor to the St. Saviour's, Southwark, Board of Works.

Mr. Mason, of 28, New Bond-street, has on exhibition at his studio probably the largest painted photograph in the world. It is an enlargement from an original photograph of the seventy-six bishops who attended the Pan-Anglican synod at Lambeth Palace, last year. It is certainly a remarkable picture, and is well worthy of a visit.

On Tuesday Prince Arthur opened the new Albert Park at Middlesborough, which has been presented to the inhabitants by Mr. Bolckow. It is about seventy-two acres in extent, and is well planted out with trees. A circular piece of ground in the centre is reserved for statuary, and three sides of the land are to be appropriated to the erection of villa residences.

Last week we alluded to a letter which Mr. E. C. Robins had sent to the St. Pancras Board of Works, asking as a favour the return of certain designs sent in for the enlargement of the workhouse. This was refused on the plea that Mr. Robins had been paid for the abandoned plans. Mr. Robins writes us and says "that while he would have felt obliged by the return of about twenty drawings in the possession of the Guardians of St. Pancras, he has not acknowledged the right of the Guardians to retain them, and could not do so in the face of the 17th paragraph of the Institute papers on 'Architectural Practice.'"

On Thursday week one of the conferences promoted by the Working Men's Club and Institute Union, on social and political questions, took place at 150, Strand, the subject for discussion being "Partnerships of Industry. Is there evidence that a system of division of profits between masters and workmen in a trading concern may be maintained so as to conduce to the welfare alike of workmen and capitalists?" The discussion was introduced by Mr. Edward Hall, F.S.A., who submitted that a complete affirmative answer was given to the question by the results of the partnership which M. Leclaire, house painter of Paris, had entered into with his workmen. This industrial partnership had existed since 1842, and among its advantages had been complete freedom from strikes, closer attention to work, and improved health and morality throughout the establishment. Others in France were following M. Leclaire's example, which differed from the industrial partnerships established in this country, in so far as it allowed the fullest inspection to all the partners. In the subsequent speeches a number of difficulties of detail were pointed out, but a general acquiescence was expressed in the principle of giving workmen an interest in the results of their labour.

The International Hotel, adjoining the London Bridge terminus of the Brighton Railway, has just become the property of the railway company, at a price of 30,000 guineas. The cost of its erection a few years ago was £147,000, so that the company has made a good bargain.

The *Standard*, reviewing the history of the numerous fires which took place in London last week, says:—We may justly, after scanning the statistics, attribute at least one-third of the disasters to indolence, and one-third to recklessness, leaving an ample proportion to unavoidable accident, to the tricks of children—though for these their parents are, more often than not, responsible; and to the phenomenon which it has been agreed to call "spontaneous combustion." We pay a heavy tax for wanton carelessness. Thus, is it not madness or worse to pour out, near a naked gaslight, volumes of a spirit known to emit inflammable vapours? Yet this was done, calamitously enough, last week. And, unless human life be lost, or there is a suspicion of arson, no inquiry takes place, no matter how enormous the amount of property destroyed.

Some sales effected at the Auction Mart on Wednesday week by Messrs. Edwin Fox and Bousfield attest the great value of land in the city. A freehold estate, including the whole of Dunster House, Mincing-lane, and other premises extending to Mark-lane, fetched £35,250. The property covers a superficial area of 15,200ft. Two freehold ground rents, of £350 per annum each, arising from Nos. 29 and 30, St. Paul's Churchyard, with the reversions to the rack rentals, obtained a price of £17,500.

At the last meeting of the Paddington Vestry it was mentioned that Mr. Roberts, one of the vestry, had offered to prepare plans and an estimate for the widening of the Harrow road without expense to the vestry. The offer is under consideration by the Highways Committee. If Mr. Roberts is a surveyor, some may consider this rather an unprofessional offer.

The directors of the London and County Bank have declared the usual dividend of 6 per cent., with a bonus of 2 per cent., for the half-year, free of income tax, equal to 16 per cent. per annum, which will absorb £75,884 5s. 4d., and leave £4,092 3s. 4d. to be carried forward to profit and loss new account. The dividend and bonus—together £1 12s. per share—will be payable at the head office, or at any of the branches, on and after Monday, the 17th inst. The amount of the bank's deposits is £12,000,000, and of rest in hand, or at notice, £3,196,000, with £1,207,000 on Government securities.

Trade News.

TENDERS.

Abingdon (Berks).—For erecting new schools for boys and girls, teacher's residence, boundary walls, &c., for the parish of St. Helen, Abingdon. Edwin Dolby, architect. Quantities by Mr. J. Crawley:—

Nightingale	£2585
Claridge	2185
Thomas and Dicks	1980
Bowler	1662

Battersea.—For Roman Catholic church at Battersea, for the Right Rev. Dr. Grant. C. A. Buckler, architect:—

Nightingale (accepted)	£800

Bill Quay.—For the erection of Wesleyan Chapel and School at Bill Quay, from plans prepared by Mr. Edward Fittes, builder, Hemworth-lane, near Gateshead:—

Masons.			
Arnold and Co.	£551	18	0

COMPETITIONS.

Lincolnshire (Lindsay).—Extension of time till September 1.—Plans for the erection of a gaol and house of correction. J. H. Holloway, Clerk of the Peace, Spilsby.

Hertford Cottage Prize Competition.—Sept. 1.—Design for model cottages for agricultural labourers. Premium, £20. R. Dimsdale, Esq., M.P, 9, Queen-square, Westminster.

CONTRACTS OPEN FOR BUILDING ESTIMATES.

Halifax.—Extension of time.—For proposed new infirmaries, fever hospital, &c., at the Halifax Workhouse. C. Barstow, Clerk to the Guardians.

Nottingham.—August 18.—For the erection of a new bridge over the river Trent. W. Enfield, public offices, Nottingham.

Portsmouth.—August 22.—For laying down, constructing, and finishing various brick, pipe, and cast-iron sewers. S. J. Elliott, clerk to the Local Board.

Contract Department, Admiralty.—August 18.—For the supply of steel and files. A. Brady, registrar.

Newhaven, Sussex.—August 24.—For the erection of a Coastguard station. Tenders to the Coastguard office, Admiralty.

Herefordshire County and City Asylum.—September 14.—For the erection of the above named building R. Griffiths, architect, 3, Martin-street, Stafford.

Aldershot.—September 15.—For the erection of a billiard room at the Royal Artillery barracks. Royal Engineer office, Aldershot.

Metropolitan Board of Works.—September 21.—For constructing and maintaining in repair certain intended brick sewers. J. Pollard, clerk, Spring gardens.

Caterham.—August 29.—For the erection of an asylum. W. F. Jebb, 37, Norfolk-street, Strand.

Baentford Union.—August 26.—For carrying out certain alterations at the infirmary of this workhouse. W. Ruston, clerk, Brentford.

Fly Union.—August 26.—For altering workhouse, and other works. Mr. G. S. Claxton, clerk, Downham-lane, Ely.

Chesham, Bucks.—September 2.—For the restoration of the parish church. Rev. A. F. Aylward, Chesham, Bucks.

Southmolton (Devon).—September 1.—First, for constructing brick or masonry and pipe sewers, and laying cast-iron water mains, &c. Second, for providing and delivering about 85 tons cast-iron water pipes. R. M. Riccard, clerk to the board, Southmolton.

Reading Union Workhouse.—August 19.—For the alteration and improvement of the drainage of the union workhouse, together with the fitting up of Moule's patent earth closets, and other works. William Pike, clerk, Reading.

Hornsey.—August 19.—For the supply of about 200 iron lamp-posts and lanterns. W. Potter, clerk to the local board.

Local Board, West Derby.—August 24.—For the construction of Brocky-lane, West Derby-road. Messrs. Radcliffe and Layton, clerks to the board, public offices, West Derby.

SMETHWICK, NEAR BIRMINGHAM.—August 23.—For the construction of a new street. Messrs. Clarke and Barrows, 38, Cannon street, Birmingham.

Plan and estimate for heating a tepid swimming bath. Mr. J. Plowman, surveyor, Oxford.

PROPERTY SALES.

AUGUST 3.

AT THE MART.—By Messrs. Bromley, Son, and Kelday.—The beneficial lease of a baker's shop and premises, situate in Britannia street, City road, held on lease for 21 years from 1869, at £60 per annum—sold for £410.

Leasehold two houses, Nos. 1 and 2, Regent street, North Brunswick street, Blackwall, producing £26 per annum, term 22½ years unexpired, at £5 per annum—£100.

At the Guildhall Coffee-house.—By Messrs. Newson and Stanley.—Freehold and copyhold property, known as Fen Farm, Methwold, Norfolk, comprising a bailiff's house, with buildings, and 381a. 20p. of arable and grazing land—£5,500.

Freehold and copyhold farm, situate at Hinderclay, Suffolk, comprising a farm residence, orchard, and garden, buildings, and 143a. 1r. 18p. of arable and pasture land—£4,250.

By Mr. Whittingham.—Freehold building land, fronting Cecil road and Wingram's lane, Leytonstone, in 30 lots.—Lots to 138 comprised the previous sales.—Lot 143, sold for £110; lot 144, £65; lot 149, £44; lots 151 to 153, £42 each; lot 156, £40; lots 160 to 162, £40 each; lots 175 and 176, £42 each; lot 179, £69.

Freehold building land, being a portion of the Collier's Wood Estate, on the Rutland, Robinson, and Norfolk roads, Lower Tooting, Surrey, in 43 lots. Lots 1 to 230 comprised previous sales.—Lot 231, sold for £102; lot 239, £60; lot 240, £70; lot 241, £60; lot 242, £58; lot 243, £56 lot 255, £67; and lot 256, £58.

AUGUST 4.

At the Mart.—By Messrs. Edwin Fox and Bousfield.—Freehold property, producing the net ground rent of £300 per annum, for 36 years, with reversion, comprising the building No. 1, Dunster-court, Mark lane, City—£8,700.

Freehold estate known as Nos. 2 and 3, Dunster court, and Nos. 12 and 13, Mark lane, occupying the area of 11,880ft., and producing £1,605 5s. per annum—£26,500.

Freehold house and shop, situate in High street, Watford, Herts, let on lease at £40 per annum—£680.

Copyhold five cottages, situate in Water lane, Watford, Herts, producing £39 per annum—£300.

Copyhold meadow, 1½ acres, near the town of Watford, Herts, let at £10 per annum—£235.

Freehold house and shop, situate in High street, Watford, Herts, let at £27 per annum—£480.

Freehold three cottages, with shops, two houses and shops and four cottages, situate in High street, Watford, producing £98 per annum—£1,050.

Freehold cottage and shop, situate as above, let at £14 6s. per annum—£185.

Freehold garden, yard, barn, and pigsties, situate as above, let at £18 per annum—£260.

Freehold plot of building land, situate as above, let at £3 per annum—£125.

Freehold property situate at Bushey Heath, Herts, known as the "Retreat," comprising a residence with stabling and grounds of about 1a. 0r. 2p., let at £40 per annum £890.

By Messrs Dear and Son.—Leasehold two houses, Nos. 3 and 4, Princes row, Pimlico, producing £34 per annum, term 63 years from 1837, at £15 15s. per annum—£490.

Leasehold net improved rent of £50 10s. per annum, secured upon property in Munster square and Little Charles street, term 99 years from 1823—£900

Leasehold net improved rent of £90 6s. per annum, secured on property in Clarence gardens, term 99 years from 1854—£1,400.

Leasehold improved rent of £50 per annum, secured on property in Cumberland street East, Regent's Park, term 99 years from 1825—£715.

Leasehold improved rent of £36 per annum, secured on property in Redhill street, and Edward mews, term 99 years from 1824—£470.

Leasehold improved rent of £21 per annum, secured on property in Stanhope street, term 96 years from 1825—£315.

Leasehold improved rent of £21 per annum, secured on property in Stanhope street, term 99 years from 1825 £315.

Leasehold improved ground rent of £14 per annum, secured on property in Stanhope street, term 99 years from—1828—£230.

Leasehold improved ground rent of £30 per annum, secured on property in Stanhope street, term 97 years from 1825—£460.

Leasehold improved ground rent of £35 per annum, secured on property in Stanhope street, term 95 years from 1825—£620.

Leasehold improved ground rent of £90 6s. per annum, secured on property in Townshend road, St. John's wood, term 50½ years unexpired—£1514.

By Mr. V. Buckland.—The beneficial interest in the residue of the lease of the West Cwmerfin Lead Mine, situate in the parish of Llanbedarnfawr, Cardigan, held for 17 years unexpired, at a royalty of 1-14, together with the erections, plant, and machinery thereon—£300.

AUGUST 5.

At the Mart.—By Mr. Alfred Savill.—Freehold property situate in the parishes of South Benfleet and Thundersley, Essex, known as Jarvis Hall, and Hope's Green estate, comprising 219a. 3r. 33p. of arable and pasture land with residence, lodge, cottages, and two homesteads—£9,050.

By Mr. Cayley.—Freehold house, No. 190, Cambridge road, Bethnal green, producing £26 per annum—£350.

Freehold house, No. 261, Hackney road, annual value £42—£960.

Leasehold improved ground-rent of £11 per annum, secured on 12 houses in Elizabeth place, Hickman's Folly, Dockhead, term 70 years from 1817—£55.

AUGUST 6.

At the Mart.—By Mr. Newbon.—Leasehold four residences, Nos. 25 to 28, Grove lane, Camberwell, total estimated rental value £230, term 60 years from 1865, at £65 per annum—£1,500.

Freehold five houses, Nos. 3 to 7, Park street, Church street, Stoke Newington, producing £76 per annum—£900.

Freehold plot of building land situate in Park street aforesaid, let at £20 per annum—£1,930.

Leasehold three cottages situate at Willesden, Middlesex, producing £46 16s. per annum, term 52 years from Michaelmas next, at £9 per annum—£355.

By Messrs. H. Brown and T. A. Roberts.—Freehold residence, with stabling, coach house, and pleasure grounds, of about 1a. 2r. 8p., being No. 23, Clapham rise—£5,550.

Freehold 1a. 0r. 8p of meadow land, fronting the Bedford private road, Clapham rise—£2,550.

At the Guildhall Coffee house.—By Messrs. Furber and Price.—Leasehold house, No. 53, Lincoln's Inn fields, producing about £267 per annum, term 49 years unexpired, at £81 15s. per annum—£1,600.

Leasehold four houses, Nos. 2 to 5, Russell terrace, Holland road, Brixton, producing £114 per annum, term 55 years unexpired, at £22 per annum—£1,870.

AUGUST 7.

At the Mart.—By Messrs. Norton, Trist, Watney, and Co.—Freehold residence, No. 14, Uxbridge road, Surbiton, with coach house, stabling, greenhouses, and pleasure garden—£3,500.

Freehold residence, garden and land, containing nearly 8 acres, situate at Balham hill, Streatham, Surrey—£8,100.

Leasehold ground rent of £12 per annum, for about 67 years, secured upon a residence situate at Balham—£210.

Ditto of £12 per annum, for about 67 years, secured upon a residence situate at Balham—£12 0

Ditto of £20 per annum, for about 67 years, secured upon Hawthorne Villa, on the road from London to Tooting—£320.

Leasehold residence, known as Holmwood-house, Balham, annual value £120, term 72 years from 1865—£1,400.

Leasehold residence, adjoining above, annual value £120, term 72 years from 1863—£1,500.

By Mr. Frank Lewis.—Leasehold residence known as Torquay Villa, Redhill, term 99 years from 1863, at £20 per annum—£105.

Leasehold three houses, Nos. 1 to 3, Alfred place, Orchard street, Essex road, Islington, producing £78 13s. per annum, term 99 years from 1855, at £10 10s. per annum—£525.

Leasehold premises, No. 12, Desborough terrace, Harrow road, let at £32 per annum, term 500 years from 1865, at £7 per annum—£260.

AUGUST 10.

At the Mart.—By Messrs. Bromley, Son and Kelday.—Freehold premises, situate in Welclose square, producing £45 per annum—£710.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

Isaac Kerridge, Basnet grove, Wandsworth, builder, August 26.—Henry Cridland, York road, Battersea, plasterer, August 18, at 12.—Robert Wood, Renshaw street, Wandsworth road, carpenter, August 18, at 11.

TO SURRENDER IN THE COUNTRY.

Henry Green, Cardiff, builder, August 21, at 11.—John George, Orleton, Herefordshire, carpenter, August 26, at 10.—Thomas Gregory, Alfreton, builder, September 2, at 12.—William Nightingale, West Bromwich, plumber, August 25, at 11.—William T. Randall, Ramsgate, builder, August 22, at 12.—William Smith, Hereford, painter, September 1, at 10.—Albert H. Baker, Bristol, plumber, August 21, at 12.—William Bastenfield, Cradley Heath, brick maker, August 19, at 12.—Jonah Bond, Crewe, brickmaker, August 19, at 11.—James Knott, Coombe, Cornwall, mason, August 24, at 11.—John Rathbone, Sheffield, joiner, August 14, at 1.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

August 26. R. Cooms, Worcester, plumber.—October 17, C. Church, Clarkson street, Bethnal green, builder.—October 23, D. Baron, Blyth terrace, Surrey, builder.—August 26, J. Barmore, Worcester, painter.—September 8, W. Murray, Carlisle, builder.—September 3, R. Smith, Britton Ferry road, near Neath, mining and civil engineer.

DIVIDENDS.

August 19, J. Adams, West Hadden, carpenter.—August 20, W. Belt, Hull, plumber.

DECLARATION OF DIVIDENDS.

J. Mackay and Son, Liverpool, timber merchants, div. 7d.—Foerster, Keir, and Brotherton, Stockton upon-Tees, timber merchants, div. 11s.

PARTNERSHIPS DISSOLVED.

Fiton and Taylor, Manchester, joiners.—Hayes Brothers, Liverpool, plumbers.

THE BUILDING NEWS.

LONDON, FRIDAY, AUGUST 21, 1868.

ENGLISH ARCHITECTS IN INDIA.

SOME of our readers may have thought the subject we treated in our last number a trivial one, and our views little supported by evidence. Such opinions may well be entertained on a subject little discussed here, and the importance of which is not appreciated. The opening of such a matter, however, gives encouragement, and we are induced to pursue it. It is by making the profession here understand that they are treated as a nullity in India that they may be awakened, after they have understood from our previous observations the large amount of work handed over to engineers instead of to architects. When these points are comprehended, we may expect the profession to move, for it is from the architects the agitation and the reform must come. The engineers and royal engineers assuredly will not of themselves make a graceful surrender; the officials will make no change, and the public will take no self-action. It is, however, a topic in which nearly every member of the profession, young and old, is interested, for there is home work in various ways as well as work in India. How many young men are there who would be glad to spend seven or ten years of their junior time in India, acquiring knowledge and practice, to return here, not only with such stores, but with savings, which may assist their professional career.

However, to the point of what is actually done now. We, to some extent, portrayed what manner of persons do the duty of architects in India. A reform is taking place with regard to architecture there, and we will show what it is, and how the staff of engineers is to become competent in architecture. It is very well known that the body is called the Engineer Establishment of the Department of Public Works in India; that all candidates have to pass an examination; and that the examiner is a competent and conscientious member of the engineering profession of established reputation—Mr. George Preston White, C.E. Mr. White has a very difficult task to accomplish, and, as far as he is allowed, he does it well. His great endeavour is not to send out book men, but practical men, testing the candidates to the best of his means, according to the walk of practice in which they have been previously engaged. A competent degree of preliminary knowledge is required by other examiners, but Mr. White sticks to the practical. The consequence is a considerable proportion of rejections, and a large amount of complaining by young men and their friends of the unfair nature of the examinations, for which we can see no foundation. It would require a prodigy of memory and practice to answer all the questions: but that is not required, only an intelligent response to questions on the practice of the candidate. If he has had no practice, of course he will break down, and he is not the man to send to India.

Looking to the duties to be performed by the engineer in India, Mr. White has determined to introduce architecture into the course, and has made an essay, but, according to the nature of the system, it is impossible for him to accomplish anything effective; nevertheless, great credit is due to him for his constant efforts in this and other directions to improve the examinations. As there are so many important engineering subjects, architecture can be only one subject, and let no one complain that it is meagrely treated. The examination on that subject is thus dealt with.

With an earnestness that merits acknowledgment, Mr. White has printed at the back of one of his examination papers a series of extracts from an address of Sir John Rennie, when president of the Institution of Civil Engineers, recommending the study of various subjects to engineers, and showing their importance. Among these are mineralogy and geology, architecture, meteorology, and theory and practice. All these are of importance, and particularly for those devoted to the service of India. It is, as we have said, an impossibility for Mr. White to do more for the examinations in architecture than he has done. It will not be a pass subject, and in fact, as will be seen by his note, Mr. White trusts more to the future studies of the candidates by their giving "some attention to architecture" than to their positive proficiency in the examinations. It will occur to our readers how narrow is the examination limited to one example and style in architecture, and yet far too copious to be adequately answered by one who has to pass the gauntlet of a number of practical subjects. So far as construction is concerned, the man who can answer this paper "without any book or MSS.," and using "freehand sketches or diagrams wherever possible to illustrate the drawing, and carefully executed to show the candidate's proficiency in this style of drawing"—such a candidate must be a man of no mean practical training, and able to erect a church or other building.

Our readers will not be so satisfied on another point, as Mr. White warns the candidates an engineer in India is frequently required to design and erect churches and other buildings. This examination will afford no test for his capacity in designing. He has his design made for him in the engraving, he is required to describe the style and the period to which it belongs, but he is not required to design the church or provide for its ornamentation. Mr. White, we are sure, is the last man to suggest that in the case of a memorial or other church in India, an engineer, having had the style given to him, is justified in taking his ornamentation from some manual of that style, regardless of the circumstances of the country, or the elements of decoration which may be afforded to him by its flowers or foliage. It is, however, necessarily from books that the engineer architect must seek his inspirations, having no previous culture of taste, no acquaintance with the local styles, and no aptitude for the appreciation of natural details of situation, or the historic or archæological relations which ought to influence his composition. There is nothing to prevent him from pitching his spire into a beautiful group of domes or minarets, so as to destroy a picture consecrated by the admiration of centuries.

In holding the empire of India we have a natural and laudable expectation that in the fulness of time, when our rule shall have borne its fruits, the monuments of our sway shall be such as to commemorate our endowments and our merits, that they shall present something characteristic of our greatness, that they shall speak to the eyes of those in after generations who cannot read the pages of our history. Let them speak of us as a race not only ennobled by the prowess of war, by the might of hand, but by the endowments of the mind—a nation which it is true fought its way to power, but gave to benighted populations a largess of moral gifts to endure beyond the triumphs of war and the ostentation of wealth. Let them remind grateful nations that we bequeathed to them our liberty, our literature, and our arts, and that those who regenerated India were not meaner than any people who ever ruled the earth. To do this requires some care and tenderness. A lasting benefit is often fleeting in its creations; reform destroys itself by generating reform. The abolition of suttee, infanticide, and immolation to idols will be erased from the statute book when the manners and customs of the people have been moulded on the new law. Thus it may not strike the multitude who were the givers of such benefits, but some well-cemented monument of builder's Gothic may hold together and accuse us of barbarism for generations. We are the creators of the metropolises of India, Calcutta, Bombay, Madras, which were villages when we entered the country, and what do they speak for us now? Calcutta is the city of palaces, the city of pretension and of sham, of ignorant cliquism and unblushing want of taste. It is a place which reduces us to the level of the Romans in art, adopting the styles of others without acquiring the artistic capacity of the originators. Calcutta is a museum of the Classic, of the mediæval, and therefore of the barbarous. Is this a state of affairs to be justified or to be endured?

Provision is, however, made for its perpetuation. In that small matter of ornamentation, where fertility of creation should be displayed, what will the engineer candidates do? They will do like their elders, they will give liberal orders to the ironmonger or ironfounder; their largeness will be shown in the dozen and the gross. Just as one of the most costly monuments in the world, which admitted of appropriate commemoration of the historical associations of its site, has been pauperised by the administration of one hundred lions' heads in knockers, so will it be in India, unless some remedy be provided.

That remedy we have already indicated. We do not object to the introduction of architecture in the examinations of engineers; on the contrary, we think it highly to be approved, as extending the study of architecture. We do not advocate the abolition of engineers, but we do advocate the formation of an architectural establishment of the Department of Public Works in India, and the consignment of the architectural examination to architects. The memorials of the architects and their corporate bodies should be directed to these points—the employment of architects for architectural works in India, the constitution of a separate body of architects for India, the appointment of architects as examiners in architecture, and the reference of all architectural questions to architects. If this agitation be systematically carried out it must be successful, because we have reason and truth on our side, and public opinion must support us.

One very useful recommendation we can give to architects is to devote more attention to the study of the architecture and monuments of India. We observe that Mr. James Fergusson is to occupy one of the evenings of the British Association with the archæology of Buddhist architecture in India. Of course, few at present possess the special qualifications of Mr. Fergusson for the exemplification of Indian architecture, but we may enlarge the bounds of our knowledge. Greater facilities of travel have allowed architectural students to devote more time to the inspection of the monuments of Greece, Asia Minor, and Egypt, but it well merits consideration whether the monuments of Greece and Asia Minor, wrought up as they have been in detail by the Dilettanti Society and various expeditions, repay the labour of the student, and whether the same time devoted to India, so little explored, would not pay better. A voyage right out to India would give the student some months there, and it is more than likely that his stay there may be rewarded by some commission or attended by some professional occupation, while not one piastre is got out of the wilds of Greece or Asia Minor.

The notebooks of such travellers would bring them special reputation beyond the twentieth repetition of Thebes or Memphis, would do more good to the profession at home, and more good to the public. We say this with due deference to the hugger-mugger opinions of some individuals who are for bottling up what little they know, and will make nothing public they can help for fear of some other architect getting anything by it.

Our own view is that the bottler-up is most likely to lose by non-communication, for we have yet to learn that the publication of the classic studies of Cockerell, Donaldson, or Falkener has done one of them the least harm. It is a healthy and noble feeling which dictates a contribution to the public for those advantages which the student has gained by study from the accumulated stores of ages and from the institutions maintained by the community at large.

There must be many questions which ought to be decided here as to the treatment of metropolitan termini, bridges, and buildings in India, which must be determined by a due regard to local influences of climate, sky, light, convenience, fitness, conformity to grouping, a proper appreciation of which is only to be acquired by extended study. One of the grand designs, the execution of which is only a work of time, is the railway bridge over the Hooghly, uniting Calcutta with its opposite suburb of Howrah. This will be a hit or a miss, an addition to the architectural resources of the metropolis, or a blot and an eyesore. Hitherto no architect has expressed an opinion on this, and yet its cost will be enormous, and it will be one of the most striking objects to the Calcutta visitor, whether he arrives by land or sea. We say India is a great mine for architects, and we wish it to be explored.

ART OF BUILDING IN CONCRETE.—III.—NICOLL'S SYSTEM.

IT is true that we do not, like our continental neighbours, live under a paternal Government, but nevertheless the legislature does provide in some measure for the health, comfort, and welfare of the public. In all cities and towns, the authorities of which are amenable to the various enactments and clauses to be found in the "Building Act," an external wall of 9in. in thickness is ensured between the inmates of houses and the inclemencies of the season. The question may naturally arise, is an absolute thickness of 9in. necessary for the purpose of excluding damp, and indispensable as the standard thickness of all external walls? Mr. Nicoll would answer in the negative. He assures us that his patent concrete slabs, possessing 4½in. in thickness, are equal to 9in. brickwork in every particular required of them. It need not be accepted as a matter of fact that because a brick happens, by mere chance, so to speak, to be one of the national standards of construction, it should be therefore equally necessary that all external walls should be at least one brick in thickness. At the same time, from the innumerable communications made to us through our well-known channel "Intercommunication," it would certainly appear that 9in. is not by any means a thickness sufficient to keep out damp. It is a common interrogatory submitted to us, demanding what is to be done with walls 14in. and 18in. thick, that have allowed the damp to penetrate them, and, more than that, thoroughly saturate them. Were we inclined to pronounce an opinion upon the matter, we should be tempted to assert that a thickness of 9in. of brickwork was not sufficient in every instance to ensure that protection from external influences that an inhabitant of a house has a right to expect. What, then, must be said, when we find a patentee advocating an immunity from all the evils so continually complained of, by a simple wall 1in. in thickness? We shall consider the subject a little in detail, and leave our readers to form their own conclusions upon it.

The system consists of erecting the external walls of houses by means of these slabs fitted into frames, made of angle and other sections of iron that may be convenient. A skeleton house, as it were, is first put up, and then filled in with the patent concrete slabs, which are secured to the framework by screws. For mere temporary purposes, such an expedient might be useful, as the facility for erecting and taking down is apparent, but with respect to the employment of them in the construction of permanent dwellings, we confess we are somewhat sceptical. Comparing them to solid brickwork, they may be likened to the thin coating of veneer that is laid over ornamental cabinet work. So far as the cost of their manufacture is concerned, the remarks we made in our last article upon the cost of the production of May's blocks, apply equally to these, since their composition is nearly identical, the only difference being that May's blocks are simply concrete bricks of a larger size than the ordinary ones. Nicoll's slabs are thin flat masses, possessing a considerable superficial area in proportion to their thickness. We should imagine that, regarded cubically, the latter ought to cost more in their manufacture than the former, owing to the fact that their extreme thinness renders them more liable to crack and disintegrate, and would therefore naturally demand a larger proportion of cement to give a superior binding property. It must be borne in mind that in the manufacture of all these concretes the cement is the binding ingredient, and that it is quite possible to make a weak as well as a strong concrete. *Ceteris paribus*, the strength of a concrete will be in proportion to the quantity of cement used, and there is one fact to be borne in mind that is constantly lost sight of, and that is, that because concrete is employed, there is no necessary guarantee that it is the best, or even as good as it ought to be. Concrete can be made so as to be no better than mud, and the whole of its strength, impermeability, and other valuable qualities are altogether dependent upon the ingredients employed, and the care and attention bestowed upon their intimate union and complete incorporation. When concrete is employed solely for foundations, these precautions, although advisable, are not absolutely so indispensable as when the material is to be used for the construction of dwellings, whether it be adapted to their erection in the fluid state, as in Tall's principle, or first made into building blocks and slabs, in accordance with the systems of May and Nicoll. From the specimen we have seen of these slabs, their surface evidently labours under the same disadvantages as that belonging to all these concrete substitutions. All external walls built of them would require painting, plastering, or some other coat of concealment, to render them tolerable to the eye.

One of the principal items of expense connected with all works of construction is that of bringing the materials to the spot or site of the intended erection. Viewed in this light, May's blocks and the ordinary brick have a great advantage over the concrete slabs. Those the patentee anticipates a demand for will be 9ft. by 4ft., and it is quite clear that a slab of these large dimensions will require extra care and labour in loading and unloading. They can neither be packed in a manner so convenient and economical as bricks, nor can they be handled with anything approaching to the same facility. A slab weighing half a ton or more would require the use of a crane to lift it from one place to another, and, although these appliances are common enough in the erection of new bridges over the Thames and river embankments, they are not to be found as ordinary accessories to building on a smaller scale. There is no question but that a percentage of loss would have to be allowed for in the transport of these larger slabs, 9ft. by 4ft., particularly if a broken one could not be used, which is by no means certain. It is alleged that one of the great uses that might be made of these slabs would be in the internal walls or partitions of houses, and that for this purpose a thickness of from 1in. to 3in. would be sufficient. Probably this thickness would be quite enough, but unless the joists could all be laid upon the external walls, which is not always the case, it is not quite apparent how they could be supported, for the most intrepid builder would scarcely dare to lay his joists on a wall only 1in. in thickness. Sometimes, but not invariably, a cross beam can be got in, but in the first place for a large room the scantling would be excessive, and, in the second place, the floor of the ceiling would never be so sound as if a wall formed their support. The great objection to the employment of these slabs for roofing purposes would be their weight; weight would necessitate heavy rafters, and, in fact, require a heavy description of truss altogether. Otherwise, in situations where this item was not considered of importance, or rather where a thoroughly good roof was regarded as the chief desideratum, these slabs fulfil all the requirements, and, moreover possess the advantage of forming the ceiling as well. So far as impermeability to wet and resistance to all the injurious influences of the weather are concerned it is only actual experience that can decide the matter; but from the known qualities of good concrete in this respect there is very little doubt but that the slabs would fulfil these conditions. The patentee is in error when he asserts that "other kinds of construction" cannot be rendered available for habitable purposes so soon as those built upon his slab principle. Houses built upon Tall's fluid or May's block system would be perfectly dry upon the conclusion of the erection, as the former material sets, dries, and consolidates with great rapidity, and May's blocks are thoroughly dried when they are used and do not absorb moisture any more than the concrete slabs. This constitutes one of the differences between them and bricks, which all absorb moisture greedily, particularly those that are fresh from the kiln. Between Nicoll's and Tall's systems there is just this difference: the former uses a permanent frame, makes his walls at a distance, and puts them up on the site; the latter uses a temporary frame and builds his walls on the spot. The question to be solved is whether it is cheaper to construct the walls in large slabs 9ft. by 4ft., and carry them to the site of the building, or to obtain the materials at or near the site and erect the walls forthwith?

IN AND ABOUT BURY ST. EDMUNDS.

THERE is but little evidence of architectural progress, in the strict sense of the term, to be seen in the neat and clean town which has gradually sprung up on and around the site of what was once the grand monastery of St. Edmund. The "front" of a new chapel belonging to one of the varieties of Dissent, in a very violent dialect of round-arched Gothic of the modern type; the Bank, a pleasing and quiet late Gothic design (we believe by Messrs. Bacon and Bell), and one or two new and somewhat staring red brick residences with a certain flavour of architectural style about them, constitute almost the only pretensions to modern architecture to be seen in the town, unless we include the two chapels in the cemetery adjoining, which, like most recent cemetery chapels, are but neat miniature churches; in this case destitute even of the interest arising from diversity of expression, as the one intended for the celebration of the Church of England burial service is identical in design with that which is devoted to Nonconformist interments.

The architectural interest of Bury is therefore almost entirely that of the past, and in this it is richer than many places that are more visited. The sight, in a comparatively small town, of two very large churches, of almost the same date (late Perpendicular), standing parallel to and within a stone's throw of each other, and with an avenue of trees shading the path from the south door of the one to the north porch of the other, is in itself curious and picturesque. The south-

ernmost church, St. Mary's, is the later of the two, and in external design is very weak, but the porch just alluded to is worth attention from its rather peculiar design and the picturesque form of its angle buttresses—octagonal in the lower stage, breaking back into two rectangular buttresses above, and finishing in a kind of square pinnacle surmounted by some nondescript heraldic animal. Internally the piers and arcade are meagre and shallow in section, but are crowned by a very fine and rich single hammer-beam roof with very elaborately carved angels; the aisle roofs of similar description and equally good. This church is built entirely of the flint pebble walling common in the district, but the other church, St. James's, is of ashlar work, except the clerestory, which is of later date than the rest. The arcade is in every way superior to that of St. Mary's, but the roof, which is new, is a high-pitched one, quite out of keeping with the date and style of the substructure, a blunder which we need hardly say is not to be charged to Mr. G. G. Scott, under whose direction the church is being restored, but to certain wiseacres among the "natives" who would needs have things done their own way. The church has been reseated with open benches (the most comfortable and sensible church benches which we remember to have sat in), and the chancel is now being rebuilt from the designs of Mr. Scott, who has adopted the pebble and quoin walling for the work, which, except on economical grounds, seems to us a mistake, as it is surely reversing the proper order of things to build the chancel of rougher and cheaper material than the body of the church. The former chancel, including the west wall and chancel arch, was part of an older church, the floor of which was on a lower level, and which was filled up to the level of the present nave. Over the roof of this lower chancel some enterprising parishioners recently inserted a memorial window in the end wall of the nave, the retention of which window was insisted upon on the rebuilding of the chancel, so that the visitor now sees the new chancel roof hipped before it reaches the nave wall, to keep it below this window. However, the chancel arch is now being raised, and we were glad to learn that a compromise had been effected as to the offending window, which is to be taken out and rebuilt somewhere in the new chancel, the roof ridge of which will then assume its proper form. The tower of St. James's, which stands a few yards from the church, is a very fine and complete specimen of a Norman tower—a part of the old monastery which has been retained as the bell tower of the church, and which is rather too heavily weighted with bells, considering that the walls showed such signs of parting company towards the top that it was thought necessary a few years ago to insert strong iron ties at each stage and screw the whole thing together, and it is to be hoped it may now be considered safe for some time to come, in spite of the weekly bell ringing, though the divergence from the perpendicular is still quite perceptible. The stone, which is a beautiful grey oolite stone (not now to be found in the neighbourhood, whatever it may have been in the Norman period), is for the most part in splendid preservation. In a private garden, not far from the church, some huge, upright, shapeless, ivy-covered masses, with here and there the bases of the shafts attached to them, mark the great piers of the "crossing" of the old Abbey Church, and tell of its size and grandeur; while the base of a single pier of the choir points out the inclination of the latter towards the north. The architectural student will linger lovingly about the later abbey gateway, with its lofty buttresses triple shafted at the angles and the rich and elaborate jamb and arch mouldings of the inner gateway, telling of the finest period of Decorated Gothic; nor less will he appreciate the bit of half-ruin known as the "Abbot's Bridge," than which, simple as it is, it would be difficult to find a bit of masonry anywhere more thoroughly characteristic of the spirit of English Gothic.

A pleasant drive of about ten miles through some very pretty country brings the tourist to the splendid church at Lavenham, perhaps the finest specimen existing of a Perpendicular church, built just at the period when the style had blossomed into its characteristic richness of decoration, but before the mouldings and pier sections had fallen into that flat and tame character which belongs to the decadence of Gothic architecture. Lavenham being now also accessible by rail, will probably become more familiar to students than formerly. Those who have not visited the church can scarcely form an idea of the rich effect produced internally by the traceried spandrels of the nave arches, with a line of rich panelling over them, and, externally, by the panelling and canopies of the buttresses and the wonderfully elaborate and varied decoration of the nave and aisle parapets, showing Gothic conventionality of ornament in all its perfection. The tower at the west end of the nave, over 140ft. in height, and built of flints with the broken faces outwards, with stone dressings, is as remarkable for its admirable masonry as for the simplicity and boldness of its design. Two or three miles farther on is the village of Long Melford, possessing a church which will also repay a visit. Though of somewhat later date than Lavenham and far inferior in general design, it contains several points of peculiar interest, especially the Lady Chapel, which is well worth inspection, as also a small chapel to the north of the chancel, called the Clopton Chapel, where there are some niches with exqnisitely delicate carved canopy work. In the north wall of the nave is a curious and well-preserved bas-relief of "The Offering of the Wise Men" of some merit as to the lines of composition and drapery. The Virgin is represented about twice the size of the other figures, to give her proper dignity, and behind the three Wise Men Joseph leans on his staff, an old man with a very melancholy and resigned expression. A villanous tower, probably built during the last century, stands at the west end of the nave, into which an arch has been opened, evidently in imitation of the grand tower arch of Lavenham, but the mouldings curiously illustrate the utter incapability of the men of that period to catch the spirit of Gothic architecture, even when copying from an example before them. Patriotic persons may indulge their feelings before the monument of Sir Hyde Parker, of naval celebrity, whose family have long dwelt at Melford; and a "classic" monument in the chancel to the memory of a certain Sir W. Cordell, would, if placed in any building of the same style, attract admiration for its picturesque and effective design. About three miles' walk out of Bury is the church of Little Saxham, with its round Norman tower, which is the only interesting part of it (we may notice *en passant* that the church is in a very dirty, ill-kept, and dilapidated state); and a walk of about the same distance in another direction, through Hardwicke Park and some pleasant fields beyond, brings us to the pretty little village church of Hawstead, wherein are two Norman doorways* preserved in the newer masonry of Late Decorated date, which masonry, formed of broken flints of various shades of blue, yellow, and green, combines with the lichen to form a natural polychromy which would delight the heart of Mr. Seddon, who held forth so eloquently before the Institute some time since on the picturesque in walling. There are other larger and more important churches within an easy walk from Bury, and we can promise that anyone making Bury St. Edmunds his head-quarters for a few days will find himself in the centre of a considerable number of architectural and archæological attractions; among which we must not forget to specify Rushbrook Hall, a brick Elizabethan mansion forming three sides of a quadrangle, with a garden in the centre and a moat surrounding it; the latter very interesting to the antiquarian, but not, we should surmise, advantageous to the health of the inhabitants.

One can scarcely pass through Cambridge without turning aside for a glance at the new chapel of St. John's College, now approaching completion, and which has been built apparently quite regardless of expense. The general plan and design, somewhat resembling the choir and crossing of a large church with the nave deducted, express very happily the precise object and place of the structure among ecclesiastical edifices, and the internal effect of the entrance will certainly be a success, but externally we should have wished to see a style more in keeping with the *genius loci*, and with less of Continental suggestions about it; and Mr. Scott's good angel had certainly forsaken him when he designed the upper portion of the tower, with its heavy, awkwark-looking pinnacles connected by a disproportionately thin and meagre balustrade. We should scarcely have credited Mr. Scott with this tower had we met with it unclaimed. Very unsatisfactory too, internally, is the effect of the heavy feet of the roof principals brought down immediately on the top of a canopied niche, upon which they appear to rest; thus giving the appearance of weakness just where the greatest strength would seem necessary. No doubt the general effect of the interior will be fine, and the Johnians may reasonably be proud of their new chapel; but when we turn from this to give one more look at the magnificent breadth and unity of design displayed in King's Chapel, we cannot but feel the distinction between the modern Gothic erection, with all its variety of ornament and detail, and the grand monument of a period when men actually and un-affectedly *thought* in stone.

* Perhaps brought from the old Abbey, the remains of which are scattered about the country in various directions.

THE ROMAN VILLA AT CHEDWORTH.

On Saturday last the members of the British Archæological Association, who have been holding their annual congress at Cirencester during the past week, paid a visit to the newly-discovered Roman villa at Chedworth, when some new facts were disclosed and discussions provoked in reference to this interesting discovery, the situation and relative positions of the different apartments being described by the Rev. Prebendary Scarth, Mr. J. W. Grover, and Professor Buckman. This villa is situate on the great Foss-road, seven miles from Cirencester, and sixteen from Gloucester, in the valley of the River Colne. It forms three sides of a square. The villa is on the property of Lord Eldon, with whose sanction Mr. James Farrer has disinterred the Roman remains and caused a museum to be erected for the reception of the relics, a cottage being built for the residence of a curator. Here, with the exception of a few remains deposited in London, all the relics dug up have been deposited, and the beautiful tesselated pavements preserved. These relics are very various, and among them were a silver spoon 2½in. long, with an arched handle of 1½in., which was found in a heap of rubbish; two silver coins—one bore on the obverse the words "*Imperator Cæsar Antoninus Augustus*," a coin of Heliogabalus; the other was one of Valens; also bronze fibulæ, rings, implements, bone hairpins, bronze coins of Constantia, Constantinus, Urbs Roma, &c., nails, armlets, twisted chains with swivels, styles, and steelyards with lead weights attached; iron implements, knives, horseshoes, chisels, spearheads, crooks to suspend a kettle, and three pigs of iron, which would tend to show that these iron articles had been manufactured on the spot. Also various kinds of pottery, but only broken fragments; a few specimens of Samian ware, a perfect mortarium, a chafing dish, &c. Bones of the horse, ox, sheep, pig, and antlers of a large herd of deer, but only two fragments of human skulls. By way of preparing the visitors for what they were about to inspect, the Rev. Prebendary Scarth, M.A., read a paper on the subject, referring as he proceeded to a plan of the recently discovered villa, which had been placed at his disposal by Mr. Farrer.

The villa, he said, lay on the slope of a valley of the Cotswold Hills, on the River Colne, and although much of the villa had been brought to light, the whole had not been disclosed, for fresh foundations of walls were constantly being found. There were undoubted proofs that the villa had been destroyed by fire, and the discovery of 257 coins, mostly of the Roman period, enabled them to fix pretty accurately the date of its destruction. No Saxon coins had been found. The position of Chedworth was marked on the map of Roman Britain in *Monumenta Historica*, but it was not mentioned in Horsley's map. The rev. gentleman proceeded to describe the general plan of the villa, which appeared to be divided into two parts, one the residence of the owner, the other allotted to the servants of the farm which was generally attached to these rural villas. A perfect Roman villa, according to Columella, contained three parts :—1. The villa urbana, or owner's residence ; 2. The villa rustica, or residence of the bailiff and farm servants ; 3. The villa fructuaria, or barns and storehouses. Two of these portions appeared to have been laid open, but much more probably remained to be uncovered, as there were indications of other buildings on the sides of the hanging wood with which this villa was surrounded. Its peculiar situation had led to its preservation ; it was situated on the declivity of a hill, and after destruction had probably been left until the underwood had hid from view and gradually covered up the remains. This would account for so much good masonry being left undisturbed. The pavements were very perfect, and of a high order of merit, and probably were executed by the same artist who had laid down those found in and around Cirencester. One of these—viz., that adjoining the principal bath—had already been drawn and described by Mr. Grover, but there was another in the same line of building equally worthy of note, containing the figures of a dance somewhat resembling our present waltz. It consisted of eight compartments, but unhappily most of them had been destroyed. The arrangements for heating the rooms and baths of this villa were in a very perfect state, and well worthy of study. At one end of the villa was an isolated building containing an octagonal reservoir. This had also been drawn and described by Mr. Grover. In this building was found an altar without any inscription on it. The Christian monogram had been found upon three stones, one of which formed a step. It was inscribed in the under portion, and certainly indicated that the builder or possessor of the villa had been a Christian, and that it was built or repaired subsequent to the time of Constantine the Great. Another inscribed stone had been found with the letters PRASIATA on it. This, as well as the monogram, had already been handled by the Rev. Mr. Lysons, as might be seen in his published volume, "Our British Ancestors." The name was a curious and interesting confirmation of the truth of history, though, perhaps, it was too bold a conjecture to ascribe the possession of the villa to the husband of Boadicea, or the stamped tiles found in Listercombe, near at hand, to Arviragus, the king mentioned by Juvenal. Descendants of these two historical persons might have flourished at a later period, for all the remains found at the villa seemed to indicate a late date. Mr. Scarth then referred to the temple discovered in the wood, a short distance above the villa, and the sculpture found in it, and to the barrow opened beyond, and especially commending the museum on the spot, which had been so neatly and carefully arranged by Professor Buckman. He concluded by hoping that wherever Roman remains were laid open the same care would be taken in their preservation.

INTIMIDATION TRIAL AL LEEDS.

THE Sheffield intimidation case was tried at the Leeds assizes on Wednesday, the 12th. John Sheridan, Isaac Morton, John Morton *alias* Hall, Henry Hinchcliffe, Edward Beebe, James Butler, Alfred Staley, Joseph Armstrong, and Daniel Sanderson were indicted for unlawfully conspiring to injure James Powell in his trade of a mason and builder, by molesting, obstructing, and using threats and intimidation to such workmen as might be willing to be hired and employed by the said James Powell ; and also prejudicing, injuring, and oppressing the said James Powell in his said trade, and preventing certain workmen of the said James Powell from continuing to work for him, at Sheffield, on April 15, and on other dates. Mr. Maule, Q.C., Mr. Hannay, and Mr. Barker were for the prosecution ; and Mr. Digby Seymour, Q.C., Mr. Fitzjames Stephen, Q.C., and Mr. Vernon Blackburn were for the defendants.

After an elaborate trial the jury retired to consider their verdict, and returned into court finding Hinchcliffe, Armstrong, and Sanderson guilty, and acquitting the remainder of the prisoners.

His Lordship said he would consult with Mr. Baron Bramwell, and pass sentence on Thursday morning.

On Thursday, his lordship said :—My learned colleague and myself have considered the circumstances of your case, with a view of determining what sentence we ought to pass upon you, and we have come to the conclusion that we cannot deal with you as he (Mr. Baron Bramwell) dealt with the prisoners whom he tried at the Old Bailey some time ago for the same offence. The question of picketing came then for the first time before a criminal court—its legal quality had not previously been declared—and at the close of a long trial the defendants, and the other members of the union to which they belonged, expressed themselves satisfied that they had committed a breach of the law. Moreover, they saw they could not adopt the practice of picketing—so as to be of any use to themselves—without violating the law, and they therefore gave an assurance that the practice should be discontinued for the future : and upon that ground it was that my learned colleague felt himself justified in discharging them without passing any sentence at all, merely getting them to enter into their own recognisances to appear for judgment when called upon. You (to the defendants) have deliberately, and with knowledge of the case to which I have just been alluding, attempted to practice picketing ; and you have done it, according to the finding of the jury, upon which I must act, by means of intimidation and annoyance, and therefore brought yourselves within the criminal law. I can readily believe what was stated by your counsel—that you took legal advice before you so acted, and that you intended to keep yourselves within the limits of the law. But I cannot sympathise with persons who, for the purpose of injuring another, intended to go to the verge of the law, and happen to be betrayed beyond it. I hope this will be a warning to you and others not to enter upon a practice so perilous, because you cannot say how far you may be led beyond the point marked out for yourselves. I feel bound to pass a sentence upon you in order to deter others from following your example, and to teach you and others that the law, while it will protect you to the full enjoyment of your rights, will also compel you to respect the rights of others. The sentence upon each of you is, that you be imprisoned for four calendar months.

PHILOSOPHICAL VENTILATION.

THE *Scotsman* refers to a new system of philosophical ventilation, which has just been introduced by Mr. J. D. Morrison, surgeon-dentist, of Edinburgh.

A peculiarly constructed grate or stove is so arranged in the making that, while it shows a very large metal frontage for heating the air, by radiation and otherwise, does not draw air from the front, which is entirely devoted to heating the air of the entire room, but is fed entirely and altogether from below and behind. By this arrangement, a perfect hot air circulation is established, similar to a hot water circulation, which never by any chance meets any interruption, but continuously goes on drawing cold air from below and behind, which, supporting combustion, yields the heat which warms the air in front. This combustion apparatus is furnished with a damper, so as to regulate to any degree of nicety the amount of combustion, and consequently of the heating of the room. By another arrangement in the grate or stove, a large quantity of air is made to meet the heat at its hottest place, and so prevent smoke. The ash-pan which receives the incombustible residue of the coke is also peculiarly constructed, and performs a double function—viz., admits air in any quantity from all points except the front, whilst, at the same time, it of course receives and accommodates the ashes. From this construction of grate it is obvious that all draught in the room is done away with, so far as supplying the combustion of either stove or grate ; but there is still another provision made in this combustion apparatus, and that is, that the draught produced by the rarefaction is also supplied from below, behind, and all round the flame or hot bed of the stove or grate. There is, therefore, no air whatever supplied in front or from any part of the room. The air of the room is therefore simply warmed, and, taking an upward direction according to the gravitation of the particles, is of course warmest at the ceiling, where, meeting the apparatus now to be described, it performs a most important function.

The ceiling apparatus is a peculiarly constructed gas or oil lamp, which, while lighting the entire room by means of a reflector or reflectors, so collects all the heat which has been evolved during the illumination as to hand it over, by conduction, to the metal of a tube, which tube also receives not only the used warm air of the room, but also the entire products of combustion. This tube, which performs the ceiling part of the ventilation, is now converted into a shaft funnel, which, expanding into another much larger tube, made entirely of copper, delivers upwards all its heated air. This heated air, whilst being conveyed through the tube, uniting its heat with that of the heat itself, which is conducted along and by the copper, is all sufficient for the purposes of continuous ventilation into, through, and out of any chimney where no fire is in the fireplace—the front of the grate in this case being, like the other grate before described, simply covered in to prevent any admission of air from the front. Where there is a fire, the used air, however, vitiated by cancerous, scrofulous, or consumptive patients of a hospital, is passed through the flame bed of the grate or stove, and there entirely consumed—the air which accompanies the diseased breathings going to support the combustion, as in the other grate below, where it is cold and pure. In like manner, all the flats of a tenement, however high, can be perfectly ventilated—the street, in the first instance, supplying pure cold air to the ground flat, the vitiated air of this flat or room passing into the fires of the room or rooms of the flat above, and so on, till it finally escapes purified nitrogen and pure carbonic acid—ready-made food for the vegetable world.

THE MASTER BUILDERS AND OPERATIVE STONEMASONS AT WALSALL.

THESE men, in order to avoid strikes, have recently been conferring together, by delegates mutually appointed, to adopt rules and regulations for their future guidance. The following are the rules agreed upon on the 6th inst. :—

1.—Hours of Labour in the Summer Months.—That the hours of labour in the summer months shall commence on 7 a.m. on Mondays, and 6 a.m. on other days, and shall cease at 5.30 p.m. on all days except Saturday, when work shall cease at 1 p.m. throughout the year.

2.—Hours of Labour in the Winter Months.—That during the period between six weeks before Christmas and six weeks after Christmas work shall commence at daylight and cease at dark, and in no case to exceed the hours of 7 a.m. and 5 p.m., except where artificial light is used, where the hours of labour are to be the same as in the summer months.

3.—Meal Time.—That during those periods when summer time is worked, half an hour be allowed for breakfast, and one hour for dinner ; and when winter time is worked half an hour to be allowed for breakfast, and half an hour for dinner.

4.—The Rate of Wages.—That when summer time is worked the wages shall be at 31s. per week of 55½ hours ; and that when winter time is worked the wages shall be 29s. per week of 50½ hours ; and wages for each day to be as follows :—

Summer Time.

Monday.....9 hours.....	£0	5	0
Tuesday .....10 ,, ...	0	5	6
Wednesday...10 ,, ...	0	5	6
Thursday.....10 ,, ...	0	5	6
Friday.....10 ,, ...	0	5	6
Saturday..... 6½ ,, ...	0	3	10
55½	1	10	10

Winter Time.

Monday.....9 hours.....	£0	5	1
Tuesday .....9 ,, ...	£	5	1
Wednesday ...9 ,, ...	0	5	1
Thursday .....9 ,, ...	0	5	1
Friday.....9 ,, ...	0	5	1
Saturday .....5½ ,, ...	0	3	7
50½	1	9	0

5.—Time of Payment.—Time of payment not to be later than 1 p.m. on Saturday, and if not paid on the job, time to be allowed at the rate of three miles per hour to walk to the pay table.

6.—Setting Stone.—That all setting be paid for at the rate of 6d. per day extra on the current rate of wages.

7.—Walking Time.—Walking distance to be 1½ miles from the bridge ; beyond 1½ miles, and not exceeding 4 miles, walking time to be allowed by employers at the rate of 3 miles per hour.

8.—Lodgings.—That lodgings, at the rate of 2s. per week, be paid for on all jobs beyond four miles. If the men are sent from the shop, and at any greater distance than eight miles, third class railway fare shall be allowed as may be mutually agreed upon.

9.—Sheds and Mess Rooms.—Suitable sheds and mess rooms on all jobs where six masons are employed more than three weeks, shall be provided. Employers neglecting to comply with this rule to pay one-half of all time lost through such neglect.

10.—Apprentices. In the matter of apprentices, to be left to the mutual agreement of the employer and his operatives.

11.—Notice.—All men must give and take one week's notice, such notice to expire at the close of the day's work, but in case of drunkenness or neglect of work any workman may be discharged without notice.

12.—Alterations.—These rules shall come in force the first week of August, 1868, and should either party require any alteration in these rules, notice shall be given in the month of January in any year, so that any alteration may be made on May 1 following; but if no such notice be given or alterations made, then these rules shall continue in force until such notice be given and such alterations made.

IMPROVED DWELLINGS FOR THE PEOPLE.

A PARLIAMENTARY paper shows that under the Act of 1866 the Public Works Loan Commissioners have agreed to advance £18,000 for the erection at Penge of thirty pairs of four-roomed cottages and thirty pairs of five-roomed cottages by the Metropolitan Association for Improving the Dwellings of the Industrial Classes; £2,500 for the erection at Highgate of forty-eight tenements of two rooms each, by the Highgate Dwellings Improvement Company; £22,000 for the erection of six blocks six stories high, on the Britannia Estate, King's Cross-road, by the Improved Industrial Dwellings Company, the blocks to comprise tenements of one, two, three, or four rooms each; £6,000 for the erection by the same company, at Greenwich, of two blocks to contain forty separate dwellings, twenty of two rooms, and twenty of three rooms; £20,000 for the erection by the same company, and also at Greenwich, of six blocks each, to contain twelve tenements of two rooms each, and twelve of three rooms each; and £13,000 for the erection at Liverpool by the Corporation, of one hundred and forty-six separate dwellings, eighty-four of two rooms each, forty-two of three rooms each, and twenty of four rooms each. The borrowers give security of the estimated value of double the amount of the loan.

THE GREAT PYRAMID OF EGYPT.

COLONEL HENRY JAMES, R.E., writes as follows to the editor of the *Athenæum*:—

In the *Athenæum* of November 16 last you were so kind as to insert my note respecting the proportions and dimensions of the Great Pyramid of Egypt, in which I stated, first, that a pyramid having a square base and a rise of nine parts in ten at the corners would have the exact proportions of the Great Pyramid; and, secondly, that the length of one side of the base was 360 derahs, or cubits of Egypt—the length of the derah being, according to Woolhouse in his "Weights and Measures of all Nations," 25·488in. This would make the side of the base equal to 764·64ft., the measured length by Colonel Howard Vyse being 764ft., and by M. Le Père and Colonel Coutell 763·6ft.

The accuracy of Woolhouse's length of the Egyptian cubit has since been questioned, and this has led me to a further investigation of the dimensions of this pyramid, or I should rather say of the units and measures employed in its design and execution, for we may consider 763·6ft. as the true length from corner to corner of the sockets which were cut into the rock at the four corners of the pyramid, to receive the corner stones. These sockets are 1in. deep, and the pyramid was surrounded with a pavement 1ft. 8in. in depth, by which the length of the sides would be reduced from 736·6ft. to 767·5ft.; and as no one ever designed or spoke of the dimensions of any building but with reference to the work which was visible and finished, we may consider 757·5 as the true length of the side of the base.

Now Herodotus tells us, "Euterpe," 168, that the arura, or Egyptian acre, "contains a square of 100 Egyptian cubits," and I infer that the side of the base was made 500 of these cubits, and that the area of the base was, therefore, exactly 25 aruræ. This would make the Egyptian cubit equal to 1·515 English feet, $500 \times 1{\cdot}515 = 757{\cdot}5$ft., the length as measured. But 1·515ft. equal 18·18in. and 18·181in. is the length of the Egyptian cubit given in the great work of the French *savants*, "Déscription de l'Egypte," and described by them as the "coudée des Grecs d'Hérodote, juste, médiocre, commune des Arabes, = 0·4618"—"the Egyptian cubit, according to Herodotus, being equal to that of Samos."

The height of the pyramid above the plane of the pavement was 481ft. The chambers and passages of the interior were set out with the cubit of 20·699in., i.e., of the same length as that of Karnak, which is preserved in the British Museum. The arrangement of the passages was obviously made to facilitate the transport of weights, including the king's body, in its case, from the entrance to the centre. The inclination of the ascending passage being made equal to that of the descending, a weight on a truck at the bottom would counterbalance, by means of a rope and pulley, a load descending from the entrance to the point where the passages meet, and be itself drawn up towards the same point, and it would counterbalance the same load when it was being drawn up the ascending passage to the centre, whilst in the same time it descended to its original position. A very slight amount of mechanical skill would be required to re establish such a mechanical arrangement for visitors to the interior of the pyramid.

PROPOSED MORTUARY, ST. MARYLEBONE.

IN a recent impression we referred to the necessity, as a sanitary measure, for establishing public mortuaries in all large towns—places that should far surpass the present inadequate and badly appointed dead-"houses." Since we wrote, Dr. Hardwicke, Medical Officer of Paddington, in a paper read before the British Medical Association, at Oxford, has ably advocated the views we put forth, and has offered many valuable suggestions to those who may have the designing of such works. We are glad to see that in St. Marylebone, where the existing "dead house" has been condemned more than once, the authorities are taking action in the matter. The following is a description of the proposed mortuary for this parish, as furnished to the Vestry by its chief surveyor, Mr. T. Gaull Browning:—

The style of the building is to be very plain Egyptian, 28ft. long, 19ft. wide, and 17ft. high, the walls of brickwork stuccoed, and the floor of stone, covered in by an iron roof, which will have the centre part only filled in with rough glass. The other portion of roof, measuring nearly three-fourths of the whole area, will be covered in with slates, boarding, and felt. For the purpose of admitting fresh air to the floor level there will be a trench the whole length on each side of the building, covered with an iron grating; each trench will have five communications with the external atmosphere by means of air bricks. For the escape of vitiated air there will be an opening at least 3in. wide all round the eaves of the roof, and the upper part will be entirely open, but protected from rain by means of a projecting frame, glazed with rough glass, and kept sufficiently high to admit of a very free escape of any impure air which may ascend into the upper part of the roof.

BAD BUILDING MATERIALS.

BUILDING operations always bring trouble to parochial boards. The Islington Board of Guardians, with their rising workhouse, are no exceptions. The churchwarden goes by chance into a brickfield to examine some bricks, and is told they are of so good a quality that 100,000 of them have been "worked in" instead of Cowley's bricks at the Islington workhouse yonder. Though stung to the quick, the churchwarden takes care not to wince, but comes home and unburdens himself to his brother guardians. A severe scrutiny is made; architect, contractors, and clerk of the works are interrogated, and it is found that there is some truth in it. Improper bricks had been delivered on the ground; some 3,000 or 4,000 had been sent away by the architect, and others by the clerk of the works; perhaps 10,000 bricks of this kind in all. The contractors are written to, and they "give a distinct assurance that such a thing shall not occur again." The answer of the contractors comes strangely on the ear. One is tempted to ask, in all simplicity, why couldn't they have given this distinct assurance before they commenced? The answer sounds as if what had been done hitherto was not entirely without their knowledge. But at that time they had not given their "distinct assurance." Before, the agreement was only a general one between gentlemen and gentlemen. Henceforward the "distinct assurance" raises the character of the agreement immensely above all that.

These contractors have a most perverse foreman. Some bad timber is brought upon the ground. The clerk of the works condemns it; the foreman takes no notice; but, in spite of the condemnation, he proceeds to work in the inferior timber. The clerk of the works (Mr. Lewis) calls in the assistance of the architect, Mr. Burden, and, with their united authority, they compel the foreman to take out the timber. Hearing this, the guardians send a complaint to the contractors, and another pretty answer comes back from them, that the foreman had done so "contrary to their wishes." But we do not hear that the foreman is dismissed or even censured, nor that the contractors have pledged their "distinct assurance" as regards the timber as well as the bricks. The guardians ought to see the necessity of at once securing this invulnerable *ægis* against imposition.

The guardians, in their anxiety about being preyed upon in this audacious way, could get no better word of comfort from the architect than that they should be watchful. This is not very complimentary to the parties concerned, but perhaps it is the only thing that can be done now. There is no reason, however, why other boards should not grow wise from the experience of the Islington guardians. The only way of getting at the contractors is in the drawing up of the contract. Let guardians turn a deaf ear to "the rules of the hon. society of contractors" and the like; and make an express stipulation, that for every load of inferior bricks or timber, the contractors shall be liable to a heavy fine. If they insist upon this they will not afterwards need to supplicate them for their "distinct assurance" that they are not to be cheated.—*The Parochial Critic.*

ARCHÆOLOGY.

"EXCAVATOR," dating from Gillingham Works, Kent, says in a letter to the *Times*:—"While excavating at the Burnt Oak Estate, Gillingham, for the purpose of procuring materials required in the construction of the new pier and landing place now in course of erection there, I have found a number of Roman interments, and near each of the mortuary urns were several small rude vases, differing in size and form. From one interment I took two very perfect specimens of Samian ware, on each of which the respective potters' names are legibly stamped—viz., "Calendus" on one, and "Reburrus" on the other. Last week I added to my discoveries a portion of a gold *torques*, an ornament worn round the neck, weighing nearly an ounce and a half, and near it a small gold ring, which I learn from page 43 of the fifth volume of the *Archæologia Cantiana*, possess a sort of money value, and was used as a medium of barter. The whole of the relics found are in the possession of Messrs. Ball and Gammon, who will be glad to show them and afford any further information respecting them on application at the works."

Mr. George Grove writes to say letters have been received from Lieutenant Warren from Jerusalem, July 21. He was settled in the city, and had found the two sappers in good health and the works making fair progress. The thanks of the society are due to Dr. Chaplin for his kind and careful superintendence during Mr. Warren's absence. Sergeant Birtles, who was obliged to come home for a few weeks for his health, returned from Southampton on July 18, with his wife, and is by this time, no doubt, again working with his old energy. Four additional sappers will leave Southampton on Saturday next.

SCHOOLS OF ART.

THE Lords of the Committee of Council on Education having, by a minute dated January 3, 1868, offered prizes—viz., one sum of £50, three sums of £40, five sums of £30, ten sums of £20, and twenty sums of £10—to the head masters of the schools of art in the United Kingdom in which the general amount of work, considered with reference to the number of students under instruction, should be found after the examinations to be most satisfactory, and having had the results of the recent examinations laid before them, have awarded the above prizes as follows:—Charles D. Hodder, Edinburgh, £50; J. S. Rawle, Nottingham, £40; J. P. Bacon, Stoke-on-Trent, £40; Edwin Lyne, Dublin, £40; D. W. Rambach, Birmingham, £30; Edward R. Taylor, Lincoln, £30; W. G. Muckley, Manchester, £30; C. M. Clarke, West London, £30; Louisa Gann, Bloomsbury, £30; W. L. Casey, St. Martin's, £20; Susan A. Ashworth, Edinburgh, £20; Joseph Kennedy, Kidderminster, £20; John Sparkes, Lambeth, £20; Robert Greenlees, Glasgow, £20; John Anderson, Coventry, £20; Herbert Gilbert, Lancaster, £20; Walter Smith, Leeds, £20; George Ryles, Warminster, £20; S. F. Mills, Spitalfields, £20; James Ford, Macclesfield, £10; J. S. Goepel, Frome, £10; John N. Smith, Bristol, £10; F. M. Black, Kilmarnock, £10; W. H. Sounes, Sheffield, £10; Samuel Eltoe, Darlington, £10; James Carter, Hanley, £10; F. F. Hosford, Llanelly, £10; William Stewart, Paisley, £10; Alexander Macdonald, Oxford, £10; W. H. Stopford, Halifax, £10; W. C. Way, Newcastle-on-Tyne, £10; John Parker, St. Thomas Charterhouse, £10; W. J. Baker, Southampton, £10; J. B. Birkmyer, Exeter, £10; Robert Cochrane, Norwich, £10; Edwin Chandler, Hull, £10; W. T. Griffiths, Ipswich, £10; John Finnie, Liverpool (south district), £10; R. C. Puckett, Bath, £10.

DEVELOPMENTS OF NONCONFORMIST CHURCH ARCHITECTURE.—IV.

THE first thing to aim at in a galleried interior is to make the gallery an integral part of the design. It ought to appear plainly as a ruling motive for the whole arrangement, not as an afterthought thrust in to spoil it. There are three ways in which a gallery may be introduced, not all perhaps equally good, but all worth noticing. For the sake of shortness they may be described as the theatre system, the balcony system, and the transept system. In the first, the gallery runs round the central area (unless at the pulpit end) in a continuous line. It is generally curved on plan, so that its seats may, as far as possible, face the preacher. It is supported on columns, which run up above it to carry a girder or a series of arches, dividing the ceiling of the central area from that over the gallery. This last point, architecturally speaking, is the characteristic one of the system. The very essence of it consists in enclosing the central space, from floor to ceiling, by a kind of open screen, of which the gallery front forms part. The gallery is thus no longer detached and disconnected from everything else; it becomes one member of the enclosing surface. This, substituting boxes for a gallery, is clear enough in an ordinary theatre. There the actual walls of the building are hardly to be seen at all, and the fronts of the boxes become in effect the visible boundary. Where the light is obtained from side windows, and where there are open seats in place of boxes, the system cannot of course be carried to such an extreme as this. But it is still possible to make the idea clear enough. The interior can still be divided into a central area, open from top to bottom, and an aisle running round this, containing one or more galleries. The gallery colonnade will of course everywhere follow the plan of the gallery front, and will re-echo it above in the horizontal member, dividing the central roof or ceiling from that of the surrounding aisle. This arrangement, at any rate, possesses unity and consistency. It may be spoiled, as it commonly has been, and as the best system may, by falling into incapable hands, but there is a possibility of architectural effect in it which has hardly yet been understood. Nos. 4 and 5 in our illustration (a plan and section slightly modified from those of the Victoria Summer Theatre, Berlin) will show one instance of its application, and the former Surrey Music-hall (No. 1) another. In neither case, of course, is the system carried out in the way that would be desirable in a religious edifice, but examples may be suggestive when they would be quite unfit for literal reproduction. In the Victoria Theatre, some dignity and impressiveness, indeed, is given by the lofty proportions of the upper stage of columns. The walls, too, follow the line of the boxes or gallery front, and this alone is a wonderful gain in unity and repose. The want of all relation between the plan of the gallery and that of the walls is one of those gross barbarisms which are always obtruding themselves through the thin disguises of chapel architecture. A curved gallery in a square chapel is generally bad enough, but if the square is to be further broken into for staircases, and the gallery made to rise and fall in all sorts of ill-contrived ways, it is absurd to waste money or thought on a building so radically hopeless.

The system just described has, of course, no pretensions to novelty as a system. The only novelty would be to see it carried out ably and thoroughly. Parts of it are common enough in existing chapels—No. 1, for instance, in our previous illustration; but, like everything else, in the great majority of them it is not worked out in a masterly, consistent way. The principle is followed, perhaps, to a certain point. There some little difficulty comes in; it is cast aside in a moment, and an opposite principle taken up, to be abandoned in its turn as soon as it becomes troublesome. For instance, the designer starts with a circular-ended gallery like that in No. 4. He runs up his columns to the roof along the straight sides of the plan, and thus divides the central ceiling from that of the gallery aisle. But, when he comes to the circular end, the question arises, "What is to be made of the chapel front outside?" To show this honestly as a part of the aisle would be too great a novelty to venture on. The "front" would not have the orthodox resemblance to that of a common church; so, to make the exterior a sham, he completely spoils the interior, continues the central ceiling right across the end gallery, and turns out another miserable compromise between custom and common sense. Now, all this is just the opposite of what is meant by the term "workmanlike." There is no power shown in it, no capacity for bringing things into order—for *designing*, in short. It ends in a kind of chaos, or what in plain English is called a muddle. There is no elaborate theory of the fine arts wanted in criticising such a result as this. Everyone with an eye for businesslike, straightforward work would condemn it instantly were it less familiar. It is not a question of ornament; it is a question of going right through on one uniform system, or of doing a little bit in this way and a little bit in that, as it seems easiest at the time. Suppose the plan starts with a gallery all round, as in Westminster Chapel (No. 2.) The objection arises, that behind the pulpit is a bad place for hearing; or that, for some other reason, the fewer seats there are there the better. Here one might suppose is a case for study—how to remove the failing and not spoil the design. Nothing of the sort. What is easier than to narrow the gallery there by two or three seats? True, the curve of the gallery will no longer fit the curve of the walls—it will look like an enormous blunder, and will be an eyesore to everyone who sees it. No matter; trifles of this kind are too common in Nonconformist churches to be talked of much, and what is the use of ornament except to cover them up? Now, it really does not need an architect to arrange a building, if *this* be arranging it; a day labourer would be quite equal to such expedients. The example quoted is not worse than hundreds of others, though it may be more conspicuous; it is a fair instance of the general practice. We are speaking here, as in other places, of the great mass of chapels built by the more educated class of Nonconformists. It is needless to be constantly repeating that there are a few bright exceptions to the remarks made; unfortunately very few in most parts of England. On the other hand, we have taken no notice of the "Little Bethels" and "Ebenezer Chapels," with their cement fronts and sham porticos. There is a certain point at which people are unassailable by any argument; and the architectural marvels last named must simply be endured while there is a class to whose capacity and stage of cultivation Little Bethelism in any of its forms happens to be the appropriate creed.

To return, however, to the subject of gallery arrangement. The system under notice admits of considerable variety in form. Fig. 3—a plan of the Queen's Theatre, Longacre—shows about the average proportion of length to breadth adopted in theatres. Much has been said at different times about their excellence as models for Nonconformist places of worship. A closer study of the subject would probably show that the system of gallery design, which we have named after them, is the principal thing worth examination, and even this needs great change and development. Much greater length is admissible in buildings only intended for speaking in than in those where a clear view of the stage is the first requirement. In the Surrey Hall (No. 1) a good voice was found to be perfectly audible throughout, the extreme length being over 150ft. It is true that the farther seats in the side galleries are not the most convenient for facing the speaker, but this objection in practice is not so serious as it looks on paper. The number of columns above and below the gallery is a weaker point in the theatre system; and if they are too small, or too far apart, a very meagre effect is apt to follow. But the greatest difficulty which a competent architect would find in perfecting it is the prejudice against carrying the principle to its logical results on the exterior. Internally the system would find favour among many Nonconformists, but they shrink from exhibiting it on the outside. They do not see that the first step towards making their buildings impressive is to make them honest. They would like them to resemble theatres within and churches without, and so they halt halfway between the two, and miss the best points of both. They would be perfectly right, indeed, in claiming that the system should be worked out in a style befitting a place of worship; but this is a very different thing from insisting that it should have the "regulation front" of a common Gothic church.

The second way in which a gallery can be introduced is on what we have called the "balcony system." The name does not perfectly define it, but will be useful for the purpose of reference. On the previous plan, it will be remembered, the gallery front was merely a horizontal member in the screen of columns dividing the central area from the gallery aisle. On the present plan there is no such division between the central and lateral spaces. The gallery simply projects from the walls of the building. The whole roof is usually in one span. There are no columns at all, or in any case none above the gallery level; and there is, therefore, no screen at all analogous to the nave arcade of a church or the box fronts of a theatre. On the former method the enclosing screen or colonnade tended to become the most important surface of the interior. On this one all the importance remains with the actual walls of the building. The fault to be guarded against now, even more than in the last case, is the want of apparent connection between the gallery and the rest of the design. Every possible means of uniting and harmonising them will be urgently needed. The plan of the gallery, for instance, should closely follow that of the building. Its horizontal lines will strongly call for a similar tendency in the chief features of the wall from which it springs, something to re-echo its form, and save it from being discordant and isolated. How to give this will of course be a special problem for the architect in each separate case; but it is plain that the conditions involved are very unfavourable to the vertical aspirations of "chapel Gothic." The windows, instead of being long, narrow, and detached, would naturally be banded together in arcades. Cornices, strings, and dados might continue the same principle, and a roof of a pitch only moderately steep would be needed to complete the whole. The more lofty the structure, indeed, the better. Here, as everywhere else, height is needed to give nobleness of effect, and to prevent our churches from being thrust out of sight by warehouses and shops. But on this system the main lines must be chiefly horizontal. The internal design requires it, and it is by the interior, in all architecture that is anything but a sham, that external character is first of all regulated.

A fire broke out at Northumberland House, Charing Cross, on Wednesday night, and the ballroom and picture gallery, 150ft. long and 50ft. high, was totally destroyed. It contained pictures, frescoes, tapestries, vases, and other articles of *vertu*, many of them of a unique and rare description, most of which have perished. A Sevres vase, 3ft. high, a gift from Charles X. of France to Duke Hugh of Northumberland, valued at £10,000, and some frescoes from the antique, have been destroyed.

ART SCHOOLS.

NOT the least interesting parts of the Report of the Science and Art Department, the main features of which we called attention to last week, are the returns of the art schools throughout the kingdom. Art schools are very much like other institutions and earthly things in general in that they cannot without suffering be left entirely to their own resources. In many of our provincial towns aid is afforded by the local corporations in addition to that given by the Science and Art Department. Still even then some difficulty is found in making headway; and in cases where the school is self-dependent this difficulty of course increases. A great deal of course depends on the conductors of these institutions; nevertheless, it is hard to expect them to make bricks without straw, as seems to be the case in some instances that have fallen under our notice. A master can scarcely be expected to devote his time to collecting subscriptions or soliciting support in addition to art teaching.

It is rather discouraging to read through the returns so many "decreases" both in funds and students from the returns of last year. True the total number of students exhibits a slight increase, but the result might have been much better if many of the schools had not fallen off in their attendance returns. Something is wrong, it is clear. Either the master cannot succeed in inspiring confidence, or the people are not thoroughly awakened to the importance of art teaching. Let which will be the case, steps should be taken to remedy it. We feel almost inclined to print in two columns side by side the names of the schools and masters that have advanced in position and numbers along with those that have retrograded. In some cases the decrease in numbers is serious. Brighton, for instance, with an attendance of 99, exhibits a decrease of 36 since last year. The result is apparent in the last words of the return, "No examination of the school took place in 1867."

PLATFORM ACCIDENTS.

TOO often the erection of raised platforms for spectacular purposes is left in the hands of incompetent men—men with whom "the rule of thumb" is all potent. The spectators of a review, a race, or of the laying of a foundation stone, are often placed "within an inch of their lives" for want of some supervision of such structures. The scantlings employed are often far too small. It would seem as if merely the dead weight of the people to be accommodated was taken into account, and that no consideration whatever was paid to the other conditions which should be regarded in the erection of platforms. If no provision is allowed by the constructors of a platform for the enthusiasm of those who are to assemble upon it, that enthusiasm will assuredly receive an untimely check. A sudden rising to the feet by the spectators will suffice to bring down all such erections in which dead-weight only is allowed for. It is highly important, therefore, that no structure of the kind should be allowed to be erected without the supervision of a professional man. In the case we are about to allude to, however, an architect was employed in erecting the platform, but the propensity for meddling and muddling was so strong in a certain subcommittee that the architect's plan was altered without his consent and in his absence.

The foundation stone of the new Townhall at Gateshead was laid on the 11th of June. The "gentlemen's" platform fell. Many persons received very serious injuries, and one of the victims has just died. Immediately on the accident taking place, the Corporation of Gateshead commenced an inquiry into the cause of the accident. But it soon became apparent to that body that it, by its subcommittee appointed to superintend the arrangements for laying the foundation stone, might find the blame resting upon its own shoulders. The fact of the architect's plans being altered had evidently oozed out, and, therefore, the corporation found that in pursuing the inquiry it would heap the blame upon itself. It seems that the architect, Mr. Johnstone, was assailed by the corporation in a most extraordinary manner. The death of a victim, however, brought the coroner on the scene. The verdict of the jury was to the effect that the deceased met his death by the falling of the platform; that the falling of the platform was caused by the want of proper struts at a certain part, and that the sub-committee were to blame for altering the plan in the absence of the architect, and for not seeing that the platform was properly inspected.

CRIMEAN MEMORIAL CHURCH, CONSTANTINOPLE.

ONE of our lithographic engravings this week represents the Crimean Memorial Church, which has just been erected at Constantinople. A competition was invited, and Mr. Burges's design was selected as the best. Some difficulties having arisen about the expense of erecting a church after Mr. Burges's design, the work was given to Mr. Street, who was second in the race. The cost of the church is about £1,800. The contractors were Messrs. Roger and Worth, Gosport; and Mr. S. Wallis, of London, clerk of the works.

ANOTHER NEW PLAN FOR THE CHANNEL RAILWAY.

MR. G. REMINGTON proposes the construction of a railway from the South-Eastern Railway at Appledore to the town of Lydd, a descending gradient of 1 in 70 for 3½ miles to Dungeness, where the level of the railway tunnel intended to pass under the English Channel would be 240ft. below the level of low water spring tides; from the latter level the line was to rise at the rate of 1 in 3,795 for about seven miles, then a descending gradient at the rate of 1 in 1,200 for about eight miles to the centre shaft, and thence another descending gradient of 1 in 3,265 for eleven miles to Cape Grisnez. From this point rising gradients of 1 in 70 and 1 in 81 to join the French railways. The height of the tunnel would be 30ft. from the soffit of the arch to the centre of the invert, leaving a clear headway of 20ft. for the trains; the space between the rails and the invert would be occupied by a spacious sewer, running along the central line of the tunnel, and on each side of it two air tunnels for the purpose of providing ventilation. The width of the tunnel was to be 25ft. It was proposed to carry the tunnel through the Wealdon formation, consisting of very strong clay, beds of freestone, and fresh-water limestone all the way. The estimated cost of the works, allowing £638,000 for contingencies, was £7,000,000. The probable income of the railway was estimated by Mr. Remington at £1 625,900 per annum, the working at £650,360, and the nett profit at £975,540.

IMPROVED CONSTRUCTION OF CHURCH ORGANS.

AT the recent opening of the church of St. Augustin, in Paris, the inauguration music was performed by an organ that, from the novelties introduced into its construction and the power of its tone, has probably few equals in any country. It was built by M. Barker, who has designed and carried out a new principle of transmission by means of electro-mechanism, which he substitutes for the usual method of mechanical transmission maintained by the agency of wooden rods, which establish the connection between the keyboard and the wind box. By obviating the necessity for employing these rods, which are a great source of danger when the instrument is being repaired or put in order, in consequence of the absolute necessity for using lights, one advantage is already gained, and the facility with which the transmission is effected is another. It is accomplished by the agency of an electrical pile, through the means of wires covered with gutta-percha. The keys act upon electro-magnets, which are attached to pneumatic levers, also the invention of M. Barker. This magnificent organ is furnished with three keyboards, each of which can sound 54 notes in every one of the 43 rows of pipes belonging to the instrument. The pedal board commands 27 bass notes, no less than 15 pedals being required to afford the necessary connection. That electricity and its various modifications is ultimately destined to play a far more important part as a prime motor than it has hitherto done there cannot be a doubt. By commencing with examples requiring only small power, as in the present instance, the way will eventually be made clear for instances upon a more extended scale.

PALACE OF THE SULTAN AT CHERAGAN.

THE works of the kiosks attached to the Palace of Cheragan, or, as the French write it, Teheragan, which have for so long a time been suspended, are now actively resumed. The Sultan takes a personal interest in them, and he has given directions for some new features not Oriental. These are rooms in the kiosks and main saloons in the palace which are to be decorated, in commemoration of his visit to France, as exact counterparts of chambers he saw or occupied at the Elysée or Tuileries. H. S. M. has, it appears, too good taste to commemorate the Georgian or Albertine decorations of Buckingham Palace, though we must own that on the occasion of the Sultan's occupation it was furnished as an imperial palace and worthy of the country. Cheragan will therefore have less of an Oriental character, but that will be made up for by the kiosks at the Seraskierat or Horse Guards, though for that matter the style of Dolma Bagcheh Palace and other modern buildings is a pleasing kind of Italian, modified by rococo, and applied in accordance with Armenian and Levantine ideas.

NEW STEAMBOAT PIERS AT WESTMINSTER AND WATERLOO BRIDGES.

SINCE the Thames Embankment has been opened for foot passengers efforts have been made to bring the magnificent piles of granite where the steamers stop also into use, and already two splendid piers have been placed in the recesses provided for them in the granite wall—one at Westminster Bridge and the other at Waterloo Bridge. Others are about to be placed at Hungerford Bridge and the Temple, and, when the embankment is completed to that point, at Blackfriars Bridge. The new piers are entirely of iron, and are as ornamental as the purpose for which they are required will permit. Of the two, that at Hungerford is the longest, and apparently most complete. It is furnished with waiting-rooms, which add considerably to its appearance, and will be very acceptable to passengers in wet or inclement weather. It is understood that the new piers will be managed by an additional number of piermen. Chains are to be placed in front of the piers to guard against accident, and they are all to be supplied with life-belts and other life-saving apparatus.

Building Intelligence.

CHURCHES AND CHAPELS.

The London correspondent of a Dublin paper says that a new Catholic Cathedral is about to be erected in the metropolis as a memorial of the late Cardinal Wiseman. A piece of ground of nearly three acres in extent has been secured in Westminster, near Buckingham Palace and the range of buildings now in course of erection on the Belgravian estate of the Marquis of Westminster. The site of the proposed church, which will be the first cathedral which the Catholics of the metropolis have been able to build since the Reformation, will cost £50,000. The committee charged with the duty of procuring funds hope to be able to push on the works in the spring.

The foundation stone for the rebuilding of the village church, Grasby, was laid on the 4th inst. The new church, which is to have stone tower and spire, is from designs by Mr. C. Buckeridge, architect, Oxford. The church is of the Decorated order of the latter part of the thirteenth century, and the total cost of the restoration will be about £2,500.

The Wesleyans have made a very decided progress in chapel building during the last year. They have built, since the conference of 1867, 126 chapels, and they have enlarged 74 others. Of these 200, as many as 78 were built in places where no Wesleyan chapel had previously existed. These 78 chapels were to accommodate 22,137 hearers; and by the other enlargements and rebuildings, some 12,000 or 15,000 other hearers would be accommodated.

Christ Church, Highfield, Hants, was reopened on Friday last, after undergoing alterations and repairs, under the direction of Mr. Colson, architect, Winchester, at a cost of from £600 to £700.

On Thursday week, the Church of the Resurrection, at Eastleigh, Barton, near Bishopstoke, was consecrated. The edifice (which has been built from designs by Mr. G. E. Street) is Early English in style, and comprises nave, chancel, and south transept. Sittings are provided for 288 persons.

Wycliffe's Church, Lutterworth, is undergoing restoration, at a contemplated cost of £7,500. Mr. G. G. Scott is the architect.

The church of Holy Trinity, New Barnet, was consecrated on Thursday week. The church, which was erected from the designs of Mr. Christian, of Whitehall-place, consists of a nave, north and south aisles, and apsidal chancel, with aisles, the southern one of which is used for the organ, with the vestry behind. Open benches of stained deal accommodate about 420 persons. The cost has been £2,996. Messrs. Dove Brothers, of Islington, were the contractors. The organ was supplied by Messrs. Bevington and Sons, at a cost of £182.

Thorpe Langton Church was reopened on the 12th inst., after restoration. In addition to a tower and spire of the Early English period, the edifice comprises a nave of three bays, and north and south aisles, with one row of seats in each. A new porch has been erected on the north side. The interior walls and the bays of the aisles have been cleared of the plaster which covered them, and the stones newly pointed. Seats of varnished deal have been substituted for the old pews, and a new roof has been erected. The pulpit, a Jacobin one, is of great rarity. Mr. J. Goddard is the architect; and the contractors were Mr. J. Stanyon, of Harborough, for the stonework, and Mr. Loveday, of Kibworth, for the woodwork.

Whitburn Church was reopened on Thursday week, after undergoing complete renovation and considerable enlargement. Increased accommodation has been afforded by widening the aisles. The general character of the new work is Early Geometrical. The east window and all the side windows are filled with glass by Clayton and Bell; the west window of the tower is by Wailes. There is also a single light, by Clayton and Bell, in the south aisle. Messrs. Austin and Johnson, of Newcastle, were the architects. The general contractor was Mr. R. Allison, of Whitburn; the joiners' work being executed by Messrs. Rankin, of Sunderland. The font, pulpit, and reredos are the work of Mr. John Roddis, of Birmingham. Mr. J. E. Hurlston was the clerk of the works.

St. Andrew's Church, Hertford, is about to be rebuilt. Mr. Johnson is the architect.

Mr. Colson, the architect to the Dean and Chapter of Winchester Cathedral, has designed new decorated iron standards for the lighting of the choir of the cathedral. The work will be executed at Coventry.

Llanfair Caereinion parish church was reopened on Tuesday week, having been rebuilt as far as possible on the old foundations. The new structure comprises nave, chancel, and north aisle, with vestry and south porch. Sittings are provided for 420 persons. Local bluestone is used for the walling, with red Shelvoke dressings. Messrs. Heaton and Co. supplied a window, and Messrs. Maw the encaustic tiles, and Messrs. Done and Davies, of Shrewsbury, glazed all the windows with green cathedral glass. Mr. E. Haycock, jun., of Shrewsbury, was the architect, and Mr. R. Lloyd, of Welshpool, the contractor. The cost is £1,900.

On Monday, August 17, the fine old parish church of South Hayling, Hants, was reopened by the Bishop of Oxford. The church has been repewed and restored, under the superintendance of Mr. G. E. Street, at the cost of £1,500. Messrs. Booth and Rogers are the builders. The subscriptions are about £300 short of the sum expended.

The new church at Llandysilio was consecrated on Saturday week. The style is Gothic, the materials being Welshpool stone with Cefn stone dressings. The bell tower and steeple are at the west end. The church is lighted by fifteen traceried windows. The interior consists of a principal nave, 20ft. wide by 80ft. long, and a north aisle 16ft. wide by 80ft. long. The altar is constructed of cedar, by Mr. George James, jun., of 25, Stephen-street, Tottenham Court-road, London. The reredos is of Caen stone, by Mr. Earp, of London. The choir is divided from the chancel by a stone screen. The seats are open, and are of Baltic timber varnished, accommodating 300 persons. The roof is open, of Baltic timber, but not varnished. The chancel contains a sedilia and piscina on the south side. There is a vestry on the north of the chancel, divided from the latter by a cusp arch and oak screen. The flooring is of encaustic tiles, by Mr. Godwin, of Hereford. The heating apparatus is by Mr. Dodwell, of Shrewsbury. The east window is by Messrs. Clayton and Bell, of London. The roof is covered with Whitland Abbey slate, with coloured ridge crests. The church has been built by Mr. J. Potter, of Welshpool, from plans of Mr. G. E. Street, A.R.A., and Mr. W. James, of London, was the clerk of the works. The cost will be £2,220.

St. Matthew's Church, Ardwick, was consecrated on Saturday last. The style is Early Decorated, and sittings are provided for 750 persons. The exterior is faced with Yorkshire stone, relieved with red Runcorn stone. The interior is lined with white brick, relieved in bands, diapers, &c., with red brick. All the stone carving has been done by Messrs. T. R. and E. Williams. The east window is by Messrs. Ward and Hughes, and the windows of the baptistery by Messrs. Lavers and Barraud. The architects are Messrs. Medland, Taylor, and Henry Taylor, St. Anne's Churchyard, Manchester.

BUILDINGS.

The corner stone of the new wing of the Girls' Orphanage, at Pantasaph, near Holywell, was laid on Wednesday, the 12th inst., by the Lady Clare Feilding. The new buildings are from the designs of Mr. Edmund Kirby, architect, A.R.I.B.A., Liverpool.

The Junior Carlton Club, having frontages to Pall Mall and St. James's-square, is rapidly approaching completion. Messrs. Lucas are the contractors, and Mr. David Brandon, of Berkeley-square, the architect. The material used is Portland stone, with enrichments of red granite and various native and foreign marbles. The cost, exclusive of furniture, fittings, gas, and decorations, will be £40,000. The warming and ventilating apparatus is by Messrs. Benham and Co., of Wigmore-street.

Scientific instruction is making decided progress in Yorkshire. At Bradford, a new Mechanics' Institution is about to be erected, at a cost of £25,000, and the directors hope that "it will rise to the rank of a People's College for Bradford, worthy of the town, and ready to do its part in that advanced education upon which, happily, the nation has set its heart." From the proceeds of the late exhibition at Wakefield, an Industrial and Fine Art Institution is in course of organisation. The rising town of Keighley is building a new Mechanics' Institution and School of Art, while the smaller towns of Otley, Eccleshill, Rothwell, and others are erecting Mechanics' Institutions for the direct purpose of advanced education.

A great improvement has just been made at Bristol by the extension of Park-row. The new road commences at the top of Lodge-street, and continues between Church-lane and Griffin-lane to the "King David." The construction of the roadway has been designed and carried out by Mr. Frederick Ashmead, M.I.C.E., engineer and surveyor to the Bristol Local Board of Health. Mr. T. H. Yabbicom was assistant engineer, and Mr. Henry Jones, the clerk of the works.

On Tuesday week the foundation stone of new parish schools at Darlaston was laid. The building, of which Mr. A. B. Brevitt is the architect, and Mr. Job Wilkes the builder, will be about 130ft. long and 68ft. broad, and it will be capable of holding 500 children. The style will be Gothic, and will be built of blue, red, and enamelled bricks. The estimated cost of the building is £2,430.

The new relief offices and dispensary for the parish of St. Pancras have just been opened. They are the first erected under the provisions of the new act, and are situate between Hunter and Compton streets, Brunswick-square. The site is L-shaped, and the rooms, which are compactly arranged, are all on the ground floor. The general waiting room is upwards of 600 square feet in area, and is lighted by lantern skylights. Doors on every side of this apartment admit to the men's and women's lavatories, fuel store, doctors' consulting-room, committee-room, and dispensary. All the rooms are very lofty and are open to the roof, the under side of the rafters being ceiled. The side walls are nowhere less than 12ft. high. All the fireplaces are fitted with Welch's patent ventilating stoves, which admit of fresh air from without being passed through the warm air chamber at the back of each into the rooms through "hit or miss" ventilators over the chimney-pieces. All the passages are paved with stone or tiles, and the floors of the rooms are of wood, under which a current of air is continually passing. The materials and the workmanship are of the best description. The cost has been £1,348. Mr. E. C. Robins was the architect, and Messrs. Scrivener and White the contractors.

TO CORRESPONDENTS.

Notice.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

Received.—I. S. L.—E.—W. W.—E. W.—D. G. L.—I. A. H.—I. M'D.—H. C.—S. G. and Son.—W. R. S.—I. A. H.—I. C.—G. W.—I. R.—C. B A.—H. C.—R. and G.—I. M. S.—I. A. D.—H. R. T.—H. K. and W.

Correspondence.

HIDDEN TREASURES IN THE BRITISH MUSEUM.

To the Editor of the Building News.

Sir,—Desirous of seeing the chalice by Cellini which has been so successfully imitated by the Messrs. Elkington, I went to the British Museum, where I had been told it was. On inquiring in the hall, I found no one knew of its whereabouts, and was recommended to apply at the Gem room. I did so, but the cup was not there, nor had the attendants any knowledge of such a thing. By them I was directed to the Vase room, with the same result; from there I was sent to the British Antiquities room, and with as little success—no one knew anything of it. At last, as a *dernier ressort*, I applied at the Print room, and having overcome the difficulty of not having a special order for that department, was admitted, and at last found the object of my search. It was under a glass shade, and carefully locked up in a cupboard. I should like to know, Sir, what is the intention in thus closely hoarding a fine work of art? It ought, I think, to be freely exhibited as a model of art design and workmanship. Is not education the chief use and end in collecting such things? And what is true of this particular thing is no less so of the greater part of the contents of the Print room. What a wealth of beauty is there locked up, kept for the occasional gratification of a limited *dilettanti*, instead of being shown for the delectation and improvement of the many! There is room down the middle of the King's library for screens, which would hold some hundreds of engravings and drawings. Here might be a most interesting exhibition, and after an interval the series might be changed. As a treat the public (the owners of the works) might see the masterpieces of Rembrandt's magic needle, Marc Antonio's invaluable Raphael renderings, &c. A good beginning would be made if the better part of the Slade bequest was thus made known. True it is a limited exhibition is even now in the library, but formed on the principle of Sam Weller's epistolary efforts, "making you wish there was more." Amongst these drawings is a chalice by

Holbein, an exquisite design most skilfully drawn; and are there not other designs of his furnishing valuable lessons to the draughtsman and designer?

Considering the primary importance now, in our world-wide trade competition, to improve in artistic qualities our manufactures generally, it behoves the Government to use every means by which public taste can be improved, and the education of the artist assisted. And one important means to this end would be the exhibition I propose.—I am, &c., P. E. M.

COMPETITIONS.

SIR,—In your impression of last week, the Metropolitan Asylum Board offer a prize of £200 for the best design for erecting a fever hospital at Homerton. The accommodation is to provide for 182 patients; the internal dimensions of the rooms are such as to afford at least 2,000 cubic feet to each patient, which would require a hospital of 364,000 cubic feet; and all that building to be erected for £1,000, not quite three-farthings per foot cube, very little more than half the value of building a common cow-shed or barn-house.—I am, &c., W. G.

THE WALWORTH COMMON ESTATE COMPETITION.

SIR,—Having attentively read the correspondence which appeared in the several journals for the past weeks on the above subject, I cannot refrain from asking permission to make one or two remarks. No doubt in competitions of the kind one or two competitors will be dissatisfied with the result, and will vent themselves through the columns of a newspaper, and after which no further notice is taken. But when an entire body of competitors complain of a great injustice being done to them, and expose it by every means in their power, and by a formal protest, published in many journals, calling upon the board of guardians to do them justice, by reconsidering their decision, and pointing out to them their mistake, it becomes a very different matter indeed; and the public, as well as the profession, cannot shut their eyes to such facts, and naturally will look for a satisfactory explanation. But what has been the result? The guardians of St. Mary, Newington, have refused to give these gentlemen any satisfaction beyond telling them "the matter is decided."

I would ask is this the proper course for a public board to adopt? and are they at liberty to induce, by advertisement and printed instructions, a number of professional gentlemen to expend two months of their time and money in getting up plans for an honest competition, to find that the only two plans out of twenty-two sent in which have not complied with those instructions and are pronounced of inferior merit are the ones to which the principal premiums are awarded, and then to be told "the matter is decided?" Is there no redress for such injustice? Are the ratepayers aware of this fact, and do they agree with the selection made by the guardians (which has been pronounced by everyone who saw the plans to be the most outrageous)? I cannot believe it. Much credit is due to those gentlemen who have so determinedly remonstrated against this board of guardians, and I am sure the public, as well as every member of the profession, will bear them out, in having justice done to them, and I hope they will be able to make the guardians pay for it.—I am, &c., E. F.

SIR,—In your paper of the 7th instant you inserted a letter sent to the guardians by the unsuccessful competitors protesting against their award, premiums having been given to plans which in several important points did not comply with their printed instructions, and at the same time asking them to appoint a professional man to go through the plans and decide on the merits

Enclosed I send the reply received from the clerk to the board, and as it is evident that any further appeal to them on moral or equitable grounds would be utterly useless, the only course left open to us is to take such legal steps to enforce a fair adjustment of our claims as we may be advised.
—I am, &c., A. G. HENNELL.
22, Southampton buildings, Chancery-lane, W.C.,
August 19.

[COPY.]
WALWORTH COMMON ESTATE.

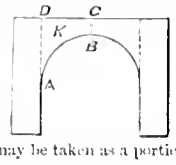
DEAR SIR,—In reply to the letter of the 3rd instant, addressed to the Guardians and signed by yourself and other gentlemen on the subject of the premiums for laying out this estate, I am directed to forward to you the accompanying resolution passed by the guardians at their last meeting.—I am, Sir, yours truly,
(Signed) JOSEPH BURGESS, Clerk.
Poor Law Offices, Vestry hall, Walworth.
August 17, 1868.

A. G. Hennell, Esq., 22, Southampton-buildings, W.C.
Resolution above referred to:—
"That the Board have already decided the question and see no reason to reopen it."

Intercommunication.

QUESTIONS.

[979.]—CENTRE OF GRAVITY OF ARCH.—Would Q. E. F., or any other correspondent, again further oblige by informing me how the centre of gravity, K, of a semi arch with a level extrados, A B C D, can be found? In the former case, a semi arch only was considered. I suppose that the part of the arch resting on the pier may be taken as a portion of the pier itself.—X + Y.



[980.]—PRIZES FOR YOUNG ARCHITECTS.—Can any of your readers tell me what are, and what the subjects and conditions, of the various prizes open to young architects? and so oblige—K. C.

[981.]—MODELLING IN CLAY.—Can any of your readers furnish me with the title and price of a good work on modelling in clay?—J. S. DAVIS.

[982.]—STRENGTH OF BRICKS.—Will you, or some of your numerous correspondents, be good enough to solve the following question:—If it requires 800lbs. to the square inch to crush a brick, how much will it take to crush 1½ cube; also the crushing weight for a brick (9 × 4½ × 3), and how it is calculated?—HYDRAULICS.

[983.]—PARTY WALLS.—I should feel obliged by a reply in your Intercommunication column to the following questions:—When there are no footings to a building forming a party wall, and there are existing eaves, in the case of the wall being pulled down what is to be considered the boundary line? The wall having been pulled down, in which there was a small light to a cellar about 1ft. square, has the proprietor of the wall a right to construct another light 4ft. by 3ft. in any other position; and having once bricked up the old opening by the building of a new wall, has he again the right of reopening it in its former position?—H. R. T.

[984.]—FISH PONDS.—Can any of your readers give me the information how to make a place hold water? It is 100ft. long by 40ft. wide, 3ft. 6in. deep. It is a clay bottom, but will not hold water. I want to preserve the fish.—FRANCIS R. CAPON.

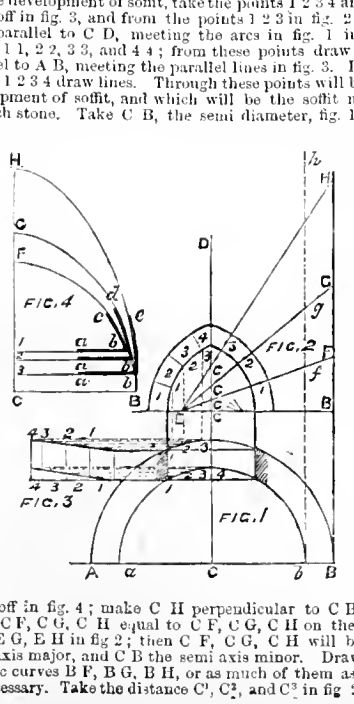
REPLIES.

[958.]—REMOVING LIMEWASH FROM BRICKWORK.—The only effectual way for "M." to restore the original colour of the brickwork and make the walls look decent, is to have them rubbed thoroughly, and the joints neatly pointed No washing with any solution would make a clean job of it.—BUILDER.

[959.]—BLACK VARNISH FOR IRONWORK.—A black varnish suitable for F Seward may be obtained from the Maritime Improvement Company, of 9, Bush-lane, E.C. It is called Hay's Protective Varnish.—E. W.

[959.]—Dr. Lunge has lately published a good recipe for black varnish. He distils gas tar till nearly all the volatile products are eliminated. He then dissolves the residual pitch either in the heavier oils, or, if a very quick drying varnish is wanted, in the light oils or naphtha. This varnish is the original tar, minus the ammoonia, water, carbolic acid, and other things which give it its disagreeable odour and cause it to be so long in drying.—SIGMA.

[960.]—GOTHIC ARCHES.—Having set out your plan, fig. 1, and elevation, fig. 2, C D being perpendicular to A B, make B H parallel to C D. Divide the arch into the number of stones required; draw the radiating joint lines E F, E G, E H to meet B H in the points F G and H. To get the development of soffit, take the points 1 2 3 4 and set them off in fig. 3, and from the points 1 2 3 in fig. 2 draw lines parallel to C D, meeting the arcs in fig. 1 in the points 1 1, 2 2, 3 3, and 4 4; from these points draw lines parallel to A B, meeting the parallel lines in fig. 3. In the points 1 2 3 4 draw lines. Through these points will be the development of soffit, and which will be the soffit mould for each stone. Take C B, the semi diameter, fig. 1, and



set it off in fig. 4; make C H perpendicular to C B, and make C F, C G, C H equal to C F, C G, C H on the lines E F, E G, E H in fig 2; then C F, C G, C H will be the semi axis major, and C B the semi axis minor. Draw the elliptic curves B F, B G, B H, or as much of them as may be necessary. Take the distance C^1, C^2, and C^3 in fig. 2, and set them on the line C H, fig. 4, at the points 1 2 and 3. From these points draw lines parallel to C B, meeting the several curves in the points $b\ b\ b$; then the angles $a\ b\ c$, $a\ b\ d$, $a\ b\ e$ will be the bed moulds to work the face of each stone from the soffit. The same operation applies to get the internal moulds from the internal diameter of plan $a\ b$. I have shown the dotted line, $b\ h$, where it intersects the radiating joint lines in the points $f\ g\ h$. Should there be a joint in the centre of arch that section will be square.
S. LEWIS.

[962.]—ST. PETERSBURG STANDARD DEALS.—A Petersburg standard C is 120 planks 12ft. 1 in. by 11in., or 60 planks 12ft. 3in. by 11in., equal to 8·0ft. run of 3ft. by 9in., or 73 deals 12ft. 3in. by 9in. and 4ft. over. All deal planks, deals, battens, and boards are reduced to this standard at importation. Deals and battens are sometimes sold by the 120; 12fts. by their respective squares; boards by the customary square. W. L——D.

[963.]—WEIGHT OF FLAT AND ROUND WROUGHT-IRON BARS.—In answer to "Cold Blast" I beg to send the following rules, viz:—To find the weight of flat malleable iron, multiply the breadth by the thickness by the length in inches, divide the product by 3·6; the quotient is the weight in pounds. For round malleable iron Multiply the square of the diameter by ·7854 by the length in inches, and divide the product by 3·6, the quotient is the weight in pounds. By these rules the metal is first reduced to cubic inches, then divided by 3.6; there being 3·6 cubic inches in 1lb. of malleable iron.—R P., Edinburgh.

[963.]—The simplest way for "Cold Blast" to proceed is to find, by calculating, the number of cubic inches in a foot length of the bar, and then multiply by the constant 0·27 for cast iron, and 0.28 for wrought To prove this rule, let us take the examples he himself gives. Firstly, what is the weight in pounds of one lineal foot of a bar 2¼in. broad by 5-16in. in thickness? The calculation will stand thus:—Weight in pounds = 2¼ × 5 16 × 12 × 0·28, or by decimals, = 2.25 × 0.312 × 12 × 0·28. Making the multiplication, we find the weight in pounds per foot run equal to 2·358 Consequently, the whole weight of the bar given by "Cold Blast," which is 3ft. long, is equal to 3 × 2·358 = 7.0.1lb., or, in round numbers, just 7lb. We proceed in a similar manner for the next example, which is of a round bar. As this bar has a total length of 39 2-16in., it will be simpler to first get the weight of one inch in length, and then multiply by the total length in inches. The area, or number of square inches of any round bar is equal to the square of its diameter multiplied by the constant number 0·7854. Since the diameter is 1 3-16in. it may be written $\frac{19}{16}$, and the calculation for the weight in pounds of one cubic inch will stand thus: $\left(\frac{19}{16}\right)^2 \times 0\ 7854 \times 1 \times 0.28$. Bearing in mind that $\left(\frac{19}{16}\right)^2$ is equal to $\frac{19}{16} \times \frac{19}{16}$ equal to the decimal 1.41, we have the calculation for the whole weight of the bar in pounds = 1.41 × 0.7854 × 1 × 0.28 × 39 2-2 = 12.08lb., or in round numbers 12lb. As a general rule, first find the weight of an inch or foot in length of the bar, and then multiply by the total length.
—X. X.

[965.]—WOODEN PILLARS.—The strength of round wooden pillars may be thus estimated:—Let P = weight in pounds which the pillar is to be loaded with, = its total length, D the diameter, and C a constant which depends for its value upon the kind of timber used. Then

$$D = \sqrt{L^2 \times \sqrt{P \times C}}$$

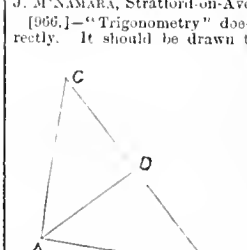
For oak, the value of C is 0 0026, and for memel 0 0023, which are practically the two woods used; for ash, a higher value of 0.0029 might be taken, but it is not possible to obtain this wood in sizes sufficiently large to serve as posts or pillars, so that it is of little or no practical use.—CARPENTER.

[966.]—CALCULATION OF A TRIANGLE.—The calculation of a triangle asked for by "Trigonometry" is very simple. The angle A D C being a right angle, we know from Euc. i., 47, that the difference between the squares of A C and A D is equal to the square of D C, i.e.

$$D C^2 = A C^2 - A D^2$$
$$= 1140^2 - 725^2$$
$$= 773975$$
$$\therefore D C = \sqrt{773975}$$
$$= 879.75$$

which, according to the question, is equal to D B And it is also clear from Euc. i., 4, that, if the base B C is bisected by the perpendicular A D, the sides A C and A B are equal, making of course the triangles A D C and A D B equal in all respects. ∴ the angle A B D is equal to the angle A C D, and the angle C A D to the angle of B A D.—J. M'NAMARA, Stratford-on-Avon.

[966.]—"Trigonometry" does not draw his figure correctly. It should be drawn thus. If A D C is a right angle, then A D B also is; and if B C be bisected at D, then in the two triangles, A D C, A D B, the two sides A D, D C are respectively equal to the two sides A D, D B, and the angles contained by them equal; therefore the triangles are equal in every respect, and the side A C = A B; then ∠ C = ∠ B, and D A C = D A B The triangle C A B is an isosceles triangle. ∴ A B is found, or rather given, by hypotheses = A C. ∠ C can be found thus:—A C : A D : : sine A D C sine A C D; ∠ C is equal to ∠ B, and ∴ A B D is found. C A B is equal ∠ C + ∠ B subtracted from 180°, and D A B = half the difference. B D is found thus: sine ∠ B : sine D A B : : A D : B D.—EUCLID.

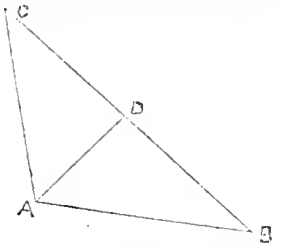


[966.]—If the triangle were properly constructed according to the particulars furnished by your correspondent, No 966, in your last number, the line A B must be equal to the line A C, and therefore 1.140ft. The angle A D C being a right angle, the line D C (to which D B is equal) must be the square root of the difference of the squares of 725 and

1.140;* and the value of the angles in right angled triangles is as the squares of the subtending sides to 90. I need scarcely add that A D C being a right angle, so also is A D B, and that the triangle A D C is equal to the triangle A D D in every particular.—A Constant Reader, Combe Down, Bath.

* 879ft. 9in. and a point so small as to be scarcely appreciable. I have not time to work out the decimal.

[966.]—"Trigonometry" has drawn his figure very incorrectly. If A D is perpendicular to B C, and B D = C D,



$\therefore$ A B = A C = 1140ft.

$$B D = C D = \sqrt{A C^2 - A D^2} = 879.75\text{ft.}$$

$$\text{Sin. A B D} = \frac{A D}{A B} = \frac{725}{1140} = .635964$$, which by the table of natural sines, is nearly equal to 39° 30'. The angle D A B is $\therefore$ = 50° 30'.—R. L. B.

[967.]—FRICTION OF WATER.—The hydraulic engineer who asks what is the "loss of velocity" in water passing through three miles of 9in. pipe, should consider that a thing cannot lose a quality which it never had. The actual velocity that the water has when passing through the pipe is the only possible one for it, and is that due to the actual size, length, and head of water. If the pipe had less length, or if it had more size or more head of water, there would be a greater velocity; but then the velocity would not be that due to the circumstances stated. The velocity in any case—that is, the mean velocity—is the square root of the following dimensions, viz.: $\frac{2{,}500\ d\ h}{l + 50}$, when d = the diameter of the pipe in feet, h = the head of water in feet, l the length of the pipe in feet, and the velocity being sought in feet per second.—S.

[969.]—WINDOW SASHES.—I beg to enclose system of working sashes with screws either one sash or double sashed windows. May be seen at Crieff Hydropathic establishment in operation; St Leonard's works Dunfermline; Mr. James Wall's, Harrie Prae Mills, Dunfermline; Mr. Srobie's, architect, Dunfermline; also savings' bank. Messrs. Blyth and Son, Liverpool, got two sent as an idea of what they were; Messrs. Dickson and Walker, 53, Frederick-street, Edinburgh have one of each kind in their warehouse; Mr. Andrew Dongan, 31, Argyle-street, Glasgow, has one of each. I will be glad to send samples of windows, say 8ft. by 3ft. 9in. or thereby, to any party at 1s. per foot, the price as yet being 2s. 6d. per foot (no glass); single sash, 1s. 10d per foot. Tracings may be sent on application. I have been busy making improvements in the mounting for some time past, so as to get a good working article, which Messrs. Beveridge and Co., St. Leonard's works, and Mr. Walls and Srobie, &c., Dunfermline, or Messrs. David Kidd and Son, builders, Dundee, &c., can testify. Everything taken into consideration this window, where plate glass is used, will be the cheapest.—James Carter, Chalmers-street, Dunfermline.

[969.]—An improved method of raising and lowering window sashes, by means of a small handle, can be seen at work at the Museum of Building Applhances, 23, Maddox-street, W.—S. T.

[970.]—RUSSIAN MOSAIC WORK.—The following is a short sketch of the process adopted at the Imperial Mosaic factory at St. Petersburg. The picture to be executed is first drawn in outline on paper or canvas, divided by lines into squares the sizes of the intended tesseræ which are coloured in with water colours. A strong wooden frame is then prepared about 6in. or 8in in depth, clamped at the angles with iron. This frame is laid on a smooth stone table and filled with mixed plaster of Paris, which is left to dry, after which it is turned, and the surface next the stone rendered quite smooth by scraping. An outline of the picture is drawn upon the stucco and lines ruled corresponding with those on the cartoon and the artist proceeds to set the tesseræ. Cutting out the stucco one square at the time within the outline sufficiently deep to take a quantity of mastic made of powdered marble and oil he inserts the tesseræ, keeping the upper surface perfectly level. The picture is then turned over on its face, and all the stucco removed from the back until the rough surfaces of the tesseræ are exposed. Roman or Portland cement is then filled in to form a solid back.—B. B.

[972.]—CHARCOAL ON LEAD.—The charcoal in the position mentioned by "An Old Subscriber" would not act in the slightest degree upon lead. In fact, charcoal has no chemical action upon any substance. It is constantly used for filtering purposes, both in cisterns, small domestic filters, and even in large waterwork reservoirs. It answers best upon a small scale, as proposed by your correspondent, as it is apt to become inactive and useless when tried too severely.—C. C.

[974.]—PAINTING COPPER GUTTERS AND ROOFS.—It is not absolutely necessary to paint copper work, as that material does not oxidise very rapidly in dry air, but considering the dampness of our climate, it is usually covered with some protecting coat, and I should strongly advise it to be always done.—Electrical Engineer.

[976.]—WATERTIGHT JOINTS.—For a good watertight joint, take glue and white lead, in equal proportions, boiled in linseed oil and water.—Haffolk Moke.

[977.]—BRICKWORK.—English bond is that in which one course is laid as headers only, and the following course as stretchers. Flemish bond consists in laying one header between every two stretchers, and in the following course one stretcher between every two headers.—V. D.

[978.]—HOLLOW WALLS.—Mr. F. Rogers, in his remarks on brickwork in "Atchley's Price Book" for 1868, says:—A very simple and effectual method is to leave a hollow space of 2in., building in alternate courses of header and stretcher, and in the header courses bonding the two walls together by bonders, which will be 14in. in the inside wall, and 2½in. in the outside; these bonders being 18in. apart, and breaking joint every other course. By this means, with the same quantity of bricks as required for 14in. work, a wall 16in. thick may be obtained with very slight addition to the labour of laying, and with a perfectly fair and even face inside and out, adding much to the effect in additional depth to the reveals, and having a hollow space, which will break the force of the wind, and will be as effectual in keeping out the weather as a hollow or double floor is found to be in preventing the transmission of sound.—J. M. W.

WATER SUPPLY AND SANITARY MATTERS.

New sewerage works have just been completed at Warwick. The sewage is applied to the irrigation of land. The works, comprising engine house, filtering tanks, "liquid tanks," &c, have been carried out under the directions of Mr. Baldwin Latham, and under the immediate superintendence of his assistant, Mr Brabazon, at a cost of £10,000.

The works connected with the thorough sewerage of Rugeley are now completed, after six months' labour. The work has been carried out by the Local Board under the direction of the resident engineer, Mr. Bonney.

WAGES MOVEMENT.

A meeting of the Wolverhampton painters was held on Saturday week, to promote union with the Manchester Alliance of house painters. Mr. Mold, the president of the Birmingham branch, stated that its labours in Birmingham during the past three years had resulted in taking three hours off the working day and raising the wages 4s. 3d. Mr. Vaughan quoted from the evidence of the secretary to the Alliance to the effect that during one year the painters had gained an increase in wages and less hours representing £9,000 by an outlay of £74 9s. 2d. If the men had struck without the Alliance to support them they would have lost £9,650, and would have gained £74 9s. 2d. The men present were urged to join the Alliance.

The committee of the Free Labour Registration Society have presented their first report. They say that during six months they have provided permanent employment for upwards of one thousand workmen in various trades, "thus showing an average of more than £150,000 a year as the wages obtained for members." The names, ages, addresses, and references as to character and ability of upwards of 14,000 non-union workmen have been up to the present time registered in the books of the society. Complaint is made that while workmen have not been slow to avail themselves of the advantages held out by this society employers of labour have not evinced an equal alacrity.

The strike in the wrought nail trade of East Worcestershire still continues. At Lye Waste, Old Hill, Cradley, Rowley, and Hales Owen, the smithies are, with few exceptions, closed, and labour is suspended.

The plate lock makers of Wolverhampton have intimated their intention to reduce the present rate of wages. The artisans engaged in the trade are already taking steps to resist any interference with their interests.

A Board of Arbitration for the settlement of disputes between masters and men in the pottery trade is in course of formation. A conference took place some short time since between a committee of the Chamber of Commerce and a select body of workmen, when the resolution to form this board was adopted, and it was agreed that the Chamber should nominate ten members and the workmen ten. The following gentlemen have been appointed on behalf of the Chamber: Mr. W. Brownfield and Mr. J. Edge, Burslem; Mr. E. Challinor, Fenton; Mr. E. Powell and Mr. F. Wedgwood, Hanley; Mr. J. Green, and Mr. J. Lockett, Longton; Mr. M. D. Hollins, Stoke; Mr. E. Clarke and Mr. E. Wedgwood, Tunstall. The names of the representatives chosen by the men have not yet been received.

STATUES, MEMORIALS, ETC.

Last week a colossal statue of John the Baptist, executed by Mr. George Burn, sculptor, Neville Arcade, was removed from Newcastle to Felling, to be placed in a niche in the gable end of the Catholic church at the latter place. The statue is 7½ft. high, and has been cut out of a solid block of Pradham stone.

A statue of Simon de Montford, Earl of Leicester, was on Thursday week placed in a niche in the Haymarket Clock tower, Worcester. The statue is of Portland stone, and stands under a canopy of Ketton stone, supported by polished serpentine columns. Mr Birlical is the sculptor. Three other statues are to be added.

STAINED GLASS.

A new stained glass window has been erected in Whitchurch parish church. At the top opening of the window is a representation of Jacob meeting his son Joseph, and below Jacob blessing his children. The window is by Messrs Ward and Hughes, of London.

LEGAL INTELLIGENCE.

Gas Companies and Street Pavements.—We think it may now be regarded as finally settled by the decision of Vice-Chancellor Malins, in Attorney General *v.* Cambridge Gas Consumers' Company, that the breaking up of the streets of a town without parliamentary authority, for the purpose of laying down pipes is such a public nuisance as will be restrained by injunction at the suit of the Attorney-General. The case is reported, 16 W. R. 1007. Few, probably, of our readers, at any rate of those who live in paved and lighted regions, will regret that the Vice-Chancellor should have arrived at this decision; yet inasmuch as the full court of appeal came to a contrary conclusion in Attorney-General *v.* Sheffield Gas Company, 3 D. M. and G. 507, a case, in many respects, upon all fours with the Cambridge case, we do not wonder that the defendants in the latter case should have proceeded with so much confidence, and have expressed so much disappointment at the issue. Still the cases are distinguishable, and the state of public feeling has, no doubt, undergone a change with respect to the nuisance occasioned by gas companies disturbing the streets, since the year of the Sheffield decision; and we take it, on the authority of Lord Cottenham, that the Court of Chancery, like every other institution, must accommodate itself to the demands of the age. We cannot, therefore, regret that another precedent has been established for the interference of the court with nuisances of this description.

Islington New Workhouse.—On the 31st ult., at the Clerkenwell Police court, Mr. Cumber, one of the partners in the firm of Messrs. John Nutt and Co., of 192, Albany-street, the contractors for the erection of the above named building, appeared in answer to a complaint preferred against them by Mr. John Turner, the district surveyor of the eastern division of Islington, under the Metropolitan Building Act, for that they had not given him a proper and sufficient notice, under the 38th section of the said act; whereby he was unable to carry out the duties of his office in reference to public buildings. Mr. Joseph E. Turner, solicitor, of 36, Gresham-street, in stating the case on behalf of the district surveyor, said that he (the district surveyor) had written to Messrs. Nutt and Co. in reference to the insufficiency of information given in the notice, and requesting them to submit the drawings and plans of the proposed work for his approval, and had also laid the case before the superintending architect of the Metropolitan Board of Works, who had communicated to Messrs. Nutt and Co. that the usual practice of builders was to give the district surveyor in such cases as this copies of the plans, &c., and that as they had failed to supply that information, and the building was in course of erection, he, the district surveyor, had, therefore, deemed it necessary to take these proceedings, and contended that the notice given by Messrs. Nutt was not a sufficient notice, inasmuch that the area, height, &c., of the proposed building or buildings were not given, and that, consequently it was impossible for the district surveyor to approve of the construction thereof, as required by the 30th section of the act, which provides that "every public building, including the walls, roofs, floors, galleries, and staircases shall be constructed in such manner as approved by the district surveyor." The notice given was then put in. Mr. Cumber, on the part of Messrs. Nutt, admitted the insufficiency of the notice, but submitted they could give no further information, as the plans and drawings were not in their hands, and the architect to the buildings had prohibited any copies being made of them. An adjournment was agreed to at the suggestion of the magistrate (Mr. Barker) to enable the defendant to supply the necessary information and particulars. At the adjourned hearing of the case on the 14th inst., it was stated by Mr. Joseph E. Turner, some further particulars had been given to the district surveyor of the buildings in course of erection, but that these were not sufficient to enable the district surveyor to approve, or otherwise, of the construction of the buildings. Mr. Cumber said Messrs. Nutt had written to the Board of Guardians acquainting them of these proceedings, and requesting that copies of the plans might be forwarded to the district surveyor, and that the district surveyor had been informed the plans could be inspected at the clerk of the works office, on the ground, and that they had never before been required to furnish such plans, &c. Mr. Barker expressed his sense of the hardship it was upon Messrs. Nutt to have to supply particulars, &c., which they had not received from the architect, and that he should have arranged by this time to give the information necessary for the district surveyor, and decided the notice was not sufficient, and imposed a penalty of £5 and 2s. costs.

Shea *v.* M'Swiney.—Cork Assizes, before Mr. Justice O'Hagan and a special jury.—This was an action for alleged fraudulent misrepresentation respecting the sale of some logs of mahogany. Plaintiff is a cabinet maker residing at Broad-lane; defendant, Mr. Eugene M'Swiney, is a timber merchant carrying on business in Cork. It transpired in the course of the evidence that it was believed by other persons in the trade in Cork that Mr. M'Swiney was connected with the Messrs. Martin, of the North Wall in Dublin, and the periodical sales of timber established by defendant were thought to interfere with the trade as theretofore carried on in Cork. The plaintiff received a catalogue of some mahogany which defendant advertised for sale in May last, and shortly after had his attention called by a Mr. O'Connor, a local timber merchant to the manner in which the measurements were given, which, it was alleged, was calculated to mislead the purchaser. Subsequently two logs were purchased at the May sale, and at a subsequent sale four logs. On receiving the invoices the plaintiff had them measured by Mr. O'Connor, and on the result of that measurement he claimed a considerable deduction from the price, alleging that his agreement was that the Liverpool system should be followed in the sale. This the defendant denied. The question mainly turned on the intention of defendant in issuing a second catalogue of the mahogany to be sold, the measurements in which varied from those in a previous catalogue. The latter was (according to the evidence of Mr. James Martin, to whom the cargo belonged) grossly and palpably inaccurate, and the evidence of defendant negatived that of plaintiff to the effect that "Liverpool measurement" was to have been allowed. Counsel for defendant contended that on the evidence the jury must come to the conclusion that the alleged misrepresentation had not been made; that plaintiff was aware at the time of his purchase of the inaccuracies in the first catalogue, and that the whole transaction was concerted by parties interested in the timber trade in Cork, with a view to putting an end to the system of periodical sales in Cork, which had been introduced by Mr. M'Swiney, as agent for the Messrs. Martin. The jury returned a verdict for defendant.

A Fine Arts and Industrial Exhibition is to be held at Wolverhampton during the spring and summer of next year. The proceeds will be applied in aid of the funds of the Wolverhampton School of Art and the South Staffordshire Educational Association.

NOTICES OF BOOKS.

The Plague of Beggars: A Dissuasive from Indiscriminate Almsgiving. By a London Physician. London: Henry Renshaw, 356, Strand.

SOUND in argument and terse in expression, this pamphlet has only to be read to awaken indiscriminate almsgivers to the fact that their conduct directly tends to foster a great social ulcer. The author's main principle is, never to give away a halfpenny but to those who are really known to be in want. By this course, as he very lucidly shows, mendicancy would be exterminated. We heartily commend a perusal of the work to our readers.

Instructions in Wood Carving, for Amateurs, with hints on design. By a Lady. Lockwood and Co.

THIS is the third work on wood carving published within the last few months. It is the last and least of the three. It is, however, what it purports to be—an unpretentious, useful little volume, compiled evidently by one who understands the subject practically. It contains information on tools and wood, instructions in pit work, carving, polishing, and staining, and several illustrations.

A Treatise on the Metallurgy of Iron. By H. BAUERMAN, F.G.S. London: Virtue and Co.

THIS is a concise history of the iron manufacture. It gives the different processes of assay and analyses of iron ores. It is illustrated with good wood engravings, and will be found a cheap and useful companion to students, practical workers in iron, and iron mine proprietors. The vast importance of this subject has called into existence many valuable works, but they are mostly of an expensive kind, whilst the one before us is inexpensive.

Illustrated Catalogue of John Weeks and Co., Horticultural Builders, King's-road, Chelsea.

THIS is the twelfth edition of a catalogue issued by Weeks and Co., horticultural builders and hot water apparatus manufacturers, King's-road, Chelsea. The catalogue consists of designs, plain and coloured, for winter gardens, conservatories, hot houses, forcing houses, vineries, &c. We can scarcely conceive of a taste or a necessity which could not find something to satisfy it in this catalogue. It shows, in fact, what remarkable progress has been made of late in the construction of horticultural buildings.

Our Office Table.

The Town Council of Walsall are taking steps to secure eighteen acres of the Lammas lands adjoining the race-course, for the purpose of forming public recreation grounds and gardens.

Mr. J. H. Cotterell, of the firm of Cotterell and Spackman, surveyors, of Bath, died on Friday last, at Weston-super-Mare, after a short illness. Mr. Cotterell was known throughout the West of England as an able and experienced member of his profession. As secretary of the Bath Centre of the Oxford Local Middle Class Examinations he laboured assiduously.

They have a curious and original way of testing the strength of bridges in Russia, that we should imagine is peculiar to that country. One of these structures was recently completed over the Moskowa River, and has been officially examined. After loading it with several hundred tons of stone, the people who had assembled to witness the trial were invited to come and stand upon it, which they did. The bridge, which was a good one, stood the test—but suppose it had not! This possible contingency, with its fatal consequences, does not appear to have suggested itself to the minds of the engineers or the people. We doubt if a similar experiment was ever made outside of England, where the Crystal Palace at Sydenham was tested by marching the Coldstream Guards through the galleries and around the dome, at quick time and in step.

By one of the last acts of Parliament passed, the tower of St. Mary Somerset, in the City, is to be preserved, and, with part of the burial-ground, to vest in the Corporation of the City of London, and part of the churchyard may be appropriated to the widening of Upper Thames-street.

The Manchester Patent Law Reform Association, at a meeting held on Friday, adopted a memorial to the Lord Chancellor praying for a remedy for certain evils in connection with the patenting of inventions. The memorialists urged the appointment of commissioners to represent mechanical, chemical, and natural science, and express a belief that facility of access to the library of the Patent Office, and a moderate supervision, under the control of law officers, would lead to a voluntary abandonment or the revision of many applications for patents.

Mr. Cumming, late city surveyor at Exeter, is dead. His successor is to be appointed at the next monthly meeting of the Town Council.

The annual meeting of the General Builders' Association will be held at the Station Hotel, Hull, on Wednesday next, at two o'clock p.m.

About 5 50 a.m. on the morning of Sunday, smoke was observed to come from the tower and spire of the parish church of Oundle, Northampton. By great exertions in two hours the flames were got under. The peal of bells (the finest in the whole county) has suffered much, the first, second, third, and tenor being cracked, one of them, through the heat, being literally broken in two. The fire is attributed to spontaneous combustion, originating in a platform filled with sawdust, which, when the church was restored, was placed there to deaden the sound of the bells on the ringers.

Considerable dissatisfaction exists amongst the trades' societies consequent upon the recent decision of Vice-Chancellor Malins in the case of the Lancashire cotton spinners, and because of the law laid down by Mr. Justice Lush, at the trial of the Sheffield masons last week, at Leeds assizes; and the leaders of the various trade societies in the metropolis are taking active measures for calling together a conference of delegates from every trade society in the metropolitan district for the purpose of considering what measures shall be adopted under the circumstances.

We read, says the *Mechanics' Magazine*, in the *Bulletin de la Societe Industrielle*, of Mulhouse, of a very simple way of making a fireproof flooring, applicable to warehouses and granaries. It consists in first spreading upon the planks a layer of clay about an inch in thickness, and running upon this a layer of asphalte about half an inch thick. Numerous experiments, we are told, have proved the efficacy of this as a protection against the spread of fire, and it has been adopted in all the corn stores of the General Omnibus Company of Paris.

Mr. Charles Turner, chairman of the board of directors, presided at the annual meeting of the shareholders of the Royal Insurance Company, which was held on Friday week at the company's offices in Liverpool. The report stated that in the fire branch the premiums received during the year 1867 amounted to £460,553, being an increase on the preceding year of £13,282. The losses which accrued during the same period were £292,125 against £379,405 in 1866. The result of the year's working showed a net profit on the British and foreign business of £43 286 and on the American business of £13,087. In the life department the progress had been very satisfactory. During the year 1867 the increase to their funds was £128,000, and the total sums now invested on the life account were £1,031,329. After paying the usual dividend of 3s. and the usual bonus of 4s. per share, they were able to carry £23,000 to the credit of profit and loss.

The arbitration movement is gradually extending itself, and is in all probability destined to be universally adopted. Last week we called attention to what was done at Huddersfield. This week we have to record that an equally encouraging step has been taken in the Potteries. A similar step has been taken at Walsall. Co-operation and Arbitration should now be the watchwords of the producers of wealth.

A sea-wall is now being constructed at Shanklin, Isle of Wight Commencing at Osborne House, the wall will be continued for 370 yards in the direction of Sandown. An esplanade will be formed from end to end, 50ft. wide. The stone is conveyed from the quarry to the top of the cliff, where there is a tunnel (the bottom of which is lined with sheet iron) through which it is shot on to the beach below, thus saving much labour. The contractor is Mr. William Summerhays.

Mr. Matthew Wardle, builder, Durham, has just died, aged 97. He was the oldest citizen.

The onion, according to an American writer, is a valuable disinfectant. He states that in the spring of 1849 he was in charge of 100 men on shipboard, with the cholera raging among them. They had onions, which a number of the men ate freely, and those who did so were soon attacked, and nearly all died. As soon as this discovery was made their use was forbidden. After mature reflection Mr. Wolff came to the conclusion that onions should never be eaten during the prevalence of epidemics, for the reason that they absorb the virus and communicate the disease; and that the proper use for them is sliced and placed in the sick room, and replaced with fresh ones every few hours. He has found the following well attested: Onions placed in the room where there is smallpox will blister and decompose with great rapidity, not only so, but will prevent the spread of the disease. As a disinfectant he believes they have no equal, when properly used; but they must be kept out of the stomach.

The Leicestershire Architectural and Archæological Society will hold its annual summer meeting at Kegworth on Wednesday, the 26th instant. The summer meetings of this society, held in the more central towns of the county, have hitherto been most successful and replete with interest; but, though Kegworth is in a remote part of the county, it is anticipated that the present gathering will be as successful as usual. Mr. M. H. Bloxam, F.S.A., is to dilate upon the features of the fine parish church; a temporary museum is to be formed, and at a public meeting to be held in the evening the Rev. Jos. Clarke, the rector, will read "Memorials of Kegworth;" Mr. James Thomson will discourse upon the objects of the Leicestershire Architectural and Archæological Society; the Rev. E. Tower will give (from a curious diary) an insight into Middle Class Life at Freestone Shore at the commencement of the present century; and Mr. Bloxam will relate some discoveries made at Lutterworth Church during the present restoration and repairs.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

3552 W. E. NEWTON. IMPROVEMENTS IN BENCH PLANES AND MOULDING TOOLS. (A communication.) Dated December 13, 1867.

This invention consists, first, in constructing an ordinary bench or other plane so that the throat or opening through which the bit projects shall be of variable size to suit the pitch of the bit and the nature of the work to be performed. The invention further consists in supporting the bit upon a movable bed, the lower end of which is pivoted or hinged to the frame or stock of the plane in rear of and close to the throat. The invention also consists in supporting the heel or lower part of the bit against a solid bed or backing of metal, such as lead (or other suitable material of sufficient hardness) formed between it and the back of the throat. Lastly, the invention consists in the construction and arrangement of a detachable and independent cap or "break iron" for turning or bending the shavings up out of the way.—Patent completed.

3571 J., J., AND J. BOOTH. IMPROVEMENTS IN MEANS OR APPARATUS FOR EFFECTING THE CUTTING OR DRESSING OF STONE. Dated December 13, 1867.

Here the cutting or dressing stools are formed, by preference, with stems to pass into sockets of lever holders, and these stems have each a thread to receive a nut, by which the tool is retained in position. Keys or wedges may, however, be used in place of the screw adjustment, and the keys or wedges may have spring ends to pass into teeth provided for them on the tool, and thereby hold them in position. Each tool may be applied to a separate lever, or there may be several tools to each lever, and the levers are used in a series arranged side by side, and they are operated by tappets or cams, which may be adjustable to raise all the levers of a series at the same or at different times, so that the action of the tools carried by them may be simultaneous, or in succession. Adjustable stops are applied to regulate depth of cut. There is much detail included in the specification.—Patent completed.

Trade News.

TENDERS.

CHATHAM.—For the erection of the chapels, lodge, boundary-walls, and other buildings at the new cemetery, Chatham:—

Carter and Son	£1593
G. Sollett	4088
R. West	4000
Wilkins and Son	3479
J. G. Naylor	3393
A. Stump (accepted)	3267

Bow (Middlesex).— For the erection of a new Passenger Station for the North London Railway Company:—

Crockett	£24,500
Myers	22,463
Dann and Sons	22,350
Mansfield and Price	22,048
Abrams	21,6 6
Dickenson and Oliver	21,660
Perry and Co.	21,287
Hill, Keddell, and Waldram	20,695
Oxford	20 5?5
Scrivener and White	20,550
Palmer	20,250
Watts	20,200
Wicks, Bangs, and Co.	19,445
Hedges (accepted)	19,400
Nightingale	14,557

BURSLEM.—For new house and shop premises, in the Waterloo-road, for Mr. James Kirkham. Quantities supplied. Mr. Ralph Dain, architect:—

Matthews	£668 0 0
Watkin	645 0 0
Blackhurst	607 12 0
Bennett and Cooke	570 0 0

LEAVESDEN ASYLUM.—Messrs. John Giles and Biven, architects. The quantities supplied by Mr. D. W Young:

	Tender.	Extra of Facing.
Thomas & Son	£90,150	£10,400
Piper & Co.	89,596	10,000
Eunor	86,790	12,350
Newman and Mann	86,478	12,485
Horsman	90,923	7,934
W. & J. Webb	88,200	9,000
Webster	95,000	—
Mayers & Sons	85,659	6,875
Warburton Brothers	87,368	7,000
Killby	87,430	6,150
Nightingale	87,000	5,500
Chappell	81,386	11,536
Wagstaff & Son	88,625	3,341
Perry & Co.	83,400	8,460
Hill, Keddell & Waldram	82,900	8,200
Kirk & Parry	78,787	11,113
Hart	44,350	3,500
Nixon & Sons	84,337	3,100
Kirk	81,500	4,987
Gammon & Sons	83,225	2,847
King & Sons	81,860	3,990
Henshaw	80,105	3,350
Nicholson (accepted)	79,650	4,250

LONDON.—For the erection of dwelling houses, Great Garden-street, Whitechapel, for Messrs. Edwards. Mr. J Hudson, architect. Quantities by Mr. W. A. Longmore:—

Furnival	£4290
Jacobs	3635
Read and Son	3625
F. and F. J. Wood	3570
Langmead	3540
Hedges	34 8
Eunor	3339
Little	3315
Hill, Keddell, and Waldram	3196
Palmer	3100

LONDON.—For the erection of buildings over the public staircases of the Holborn Valley Viaduct. Mr. W. Haywood, engineer. Quantities by Mr. F W. Stent:—
Hill, Keddell, and Waldram (accepted)... £20,291

LONDON.—For the erection of house and offices at Strond Green Lane, Islington, for Mr. W. Jenkinson. Mr. F. Waller, architect. Quantities supplied by Messrs. Franklin and Andrews:—
Hill, Keddell, and Waldram (accepted) £2623

LONDON —Painting, &c., the premises of the Metropolitan Board of Works, Spring Gardens: —

Patrick and Son	£1445
Beard and Morrison	1288
T. Husey	1200
T. Rider and Son	1192
W. Downs	1150
C. W. Andrew	1100
E. Thirst	975
S. Nixon and Son	805

LONDON.—For building foundry wharf at Wapping, for Innes Brothers and Co. Mr. D. Cubitt Nicholls, architect. Quantities supplied:—

Myers	£2115
Macey	1996
Conder	1969
Rider and Son	1889
Ennor	1701
Newman and Mann	1671
Coleman	1645
Brass and Sons	1594
Hill, Keddell, and Waldram (accepted)	1582

STOURBRIDGE.—For new church at Humber Hill. Mr T. Smith, architect:—

G. and F. Higam	£3015 0 0
Stockton and Co	2517 7 0
Nelson	2347 0 0
Ife	2315 0 0
Chapman	1850 0 0

STREATHAM.—For the erection of two houses at Streatham, for George Pratt, Esq. Henry Jarvis and Son, architects:—

Rider and Sons	£5450
Downs	5390
Loat	5380
Macey	5091
Higgs	4987
Myers and Sons	4985
Tarrant	4927
Browne and Robinson	4798
Henshaw	4689
Thompson	4370

THATCHAM (Berks).—For house for Rev. H. Martin. Messrs Newman and Billing, architects. Quantities not supplied:—

Elliott	£2645
Wells	2590
Alloway (too late)	2550
Wheeler	2301

STOW MARIES (Essex).—For additions and repairs to the rectory house, buildings, and chancel of church. Mr. Fred. P. Walters, architect:—

Killby	£1176
Saunders	1100

TEDDINGTON.—For mansion, banks of the Thames, Teddington, for B. Higgs, Esq. Walker and Elsam, architects and surveyors:—

Dunkey	£12,705
Staines and Son	11,883
Nightingale	11,821
Ratkins	11,485
Foale	11,130
Gibson	11,119
Turner	10,700
Munday and Hutchinson	10,300

WEST CROYDON.—For erecting St. George's Presbyterian church and schools, West Croydon. Mr. J. T. Barker, architect. Quantities supplied by Mr. D. J. Brown:—

Knight	£3345
Myers	3018
Dove Brothers	2645
Mansfield, Price, and Co.	3161
Hill, Keddell, and Waldram	3408
Longmire and Burge	3379
Sewell and Son	3350
Carter and Sons	3348
Pollard	2765

COMPETITIONS.

LINCOLNSHIRE (LINDSAY).—Extension of time till September 1.—Plans for the erection of a gaol and house of correction. J. H. Holloway, Clerk of the Peace, Spilsby.

HERTFORD COTTAGE PRIZE COMPETITION.—Sept. 1.—Design for model cottages for agricultural labourers. Premium, £20. R. Dimsdale, Esq., M.P, 9, Queen-square, Westminster.

STROUD LOCAL BOARD OF HEALTH —For plan and estimate of a covered reservoir to hold 1,000,000 gallons, and arrangements for filtering the water. Premium £10. Mr. E. Mitchell, clerk to the board.

INDIA.—Public Works' Department.—Competitive examinations for forty appointments in the Engineer Establishment in the month of December next. W. T. Thornton, India Office.

CONTRACTS OPEN FOR BUILDING ESTIMATES.

HALIFAX.—Extension of time.—For proposed new infirmaries, fever hospital, &c., at the Halifax Workhouse. C. Barstow, Clerk to the Guardians.

HEREFORDSHIRE COUNTY AND CITY ASYLUM.—September 14.—For the erection of the above named building R. Griffiths, architect, 3, Martin-street, Stafford.

ALDERSHOT.—September 15.—For the erection of a billiard room at the Royal Artillery barracks. Royal Engineer office, Aldershot.

METROPOLITAN BOARD OF WORKS.—September 24.—For constructing and maintaining in repair certain intended brick sewers. J. Pollard, clerk, Spring gardens.

CATERHAM.—August 29.—For the erection of an asylum. W. F. Jebb, 37, Norfolk-street, Strand.

BRENTFORD UNION.—August 26.—For carrying out certain alterations at the infirmary of this workhouse. W. Ruston, clerk, Brentford.

FLY UNION.—August 26.—For altering workhouse, and other works. Mr. G. S. Claxton, clerk, Downham-Lane, Ely.

CHESHAM, BUCKS.—September 2.—For the restoration of the parish church. Rev. A. F. Aylward, Chesham, Bucks.

SOUTHMOLTON (Devon).—September 1.—First, for constructing brick or masonry and pipe sewers, and laying cast-iron water mains, &c. Second, for providing and delivering about 85 tons cast-iron water pipes. R. M. Riccard, clerk to the board, Southmolton.

Plan and estimate for heating a tepid swimming bath. Mr. J. Plowman, surveyor, Oxford.

PADDINGTON WORKHOUSE.—September 1.—For the erection of works for enlargement of infirmary. H. Aveling, clerk to the guardians.

EDMONTON UNION.—August 26.—For providing and fixing all necessary fittings to lavatories at the workhouse schools, Enfield. W. Pulley, clerk.

HIGH HAM, NEAR LANGPORT, SOMERSET.—August 25.—For work to be done in restoring the church. Messrs. Foster and Wood, architects, 6, Park street, Bristol.

BIRKENHEAD.—August 26.—For the erection and completion of a bridge over the Birkenhead railway. A. Walm, clerk to the Improvement Commissioners.

OXFORD-ROAD, MANCHESTER.—For the erection of a new catholic church J. A Hansom, architect.

BURTON-ON-TRENT.—September 12.—For alterations and additions to police station. R. Griffiths, architect, 3, Martin street, Stafford.

WIMBLEDON LOCAL BOARD.—August 26.—For the construction of about 1,100 yards, 12in. pipe sewer, and about 900 yards, 18in. pipe sewer, &c. Messrs. Batt and Son, clerk to the board.

ALDERSHOT.—September 1.—For the erection of married soldiers' quarters and east infantry barracks. Director of contracts, War Office, Pall Mall.

HIGHGATE.—September 30.—For the erection of an infirmary at Highgate. J. Moore, clerk, vestryhall, St. Pancras.

LEAVESDEN WOODSIDE (near Watford).—September 30.—For the erection of schools. J. Moore, clerk, vestry hall, St. Pancras.

ST. PANCRAS.—September 3.—For the erection of a mortuary house and other works on the burial ground adjoining the workhouse. J. Moore, clerk, vestry hall, St. Pancras.

TEIGNMOUTH, DEVON.—For the erection of a coast guard station. Drawings, &c., at coast guard watch room. Tenders to the Admiralty coast guard office.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

Thomas M'Lean Knollmann Cathrey, Arthur road, Mostyn, Brixton, engineer, August 26, at 1—Robert Fitch, Dulwich, builder August 27, at 11—Philip Anley, Manor-road, Stoke Newington and Whitecross street, St. Luke's, contractor, September 2, at 12—Alfred Bacon, Hornchurch, builder, August 28, at 11—William Joseph Birtchnell, Clapham-park-road, mason, August 28, at 12—Thomas Fleming, Greenwich and Southsea, builder, September 2, at 12—John Frederick Kent, Thornton heath, carpenter, September 2, at 12—Joseph Perigoe, Tunbridge Wells, builder, August 28, at 12.

TO SURRENDER IN THE COUNTRY.

Henry Dashwood, Birkenhead, decorative painter, August 25, at 2—John Douglass, Aston, boat builder, Augus 27, at 10—George Johnson Hull, joiner, August 26, at 12—John Marsh, Moorfields, Gloucestershire, carpenter, September 11, at 12—Joseph Walter Meatyard, Mere, Wilts, carpenter, August 29, at 11—Joseph Oliver, Everton, builder, August 24, at 2—Henry Sparks, Exmouth, brick and tile maker, August 29, at 11—George and James Cox, Worcester, builders, September 2, at 11—John Rathbone, Sheffield, joiner, September 2, at 1—Jonathan Shaw, Golcar, painter, August 28, at 10—George William Smith, Huddersfield, brick and tile maker August 28, at 10.

NOTICES OF SITTINGS FOR LAST EXAMINATION.

September 25, H Allen, Chessets Wood, Warwickshire, bricklayer—September 2, J. Langley, Rochester, bricklayer—September 4, A. Crosland, Salford, engineer—October 21, C. Davis, Church Gresley, Derbyshire, builder—August 27, E Evans, Llandudno, joiner—October 6, J. Hall, Bloxwich, near Walsall, bricklayer.

DIVIDENDS.

August 31, R. Brown, Beddington, Northumberland, joiner—August 28, R. Rimington, Sheffield, joiners' tool manufacturer.

PARTNERSHIPS DISSOLVED.

Snawdon and Co., East Stonehouse, cabinet makers; and Yealmpton, timber dealers—Robinson and Wilson, Hawton and Newark, brickmakers—Rankin and Spence, Battersea Railway Wharf, brick merchants Wright and Vickers, Brushes Clough, near Oldham, fire brick manufacturers—J. and T. Ellis, Mirfield, stonemasons—Minton and Co., Stoke upon Trent, encaustic tile manufacturers—Worssam and Co., Kings-road, Chelsea, engineers.

DECLARATION OF DIVIDEND.

M. Mason, Cambridge, contractor, div. 2s. 2d.

THE BUILDING NEWS.

LONDON, FRIDAY, AUGUST 28, 1868.

THE ART OF BUILDING IN CONCRETE.—IV.—THE HOLLOW SYSTEM.

WE have reserved for a concluding article the consideration of what may be correctly termed the hollow system of concrete building. By this designation it must not be understood that the walls are built of concrete with a hollow space in the middle, or that their construction resembles in any manner that of hollow walls of brickwork, where, by employing a proper arrangement of headers and stretchers, a sufficient amount of "bond" is obtained together with the requisite number of interstices. Manifestly, walls built of concrete could not be constructed in this way, as it would be next to impossible to insert the headers in their proper places. Of the two or three principles of this method of concrete building, that of Messrs. Parr and Strong's occupies a prominent place. It consists, firstly, in the manufacture of hollow polygonally-shaped short lengths of earthenware pipes; secondly, in filling these with concrete; and, thirdly, in building walls of the pieces thus filled. The length of the box, as these receptacles for concrete may be called, determines the thickness of the walls, and can, of course be varied to adapt themselves to the circumstances of any particular case. It is difficult to arrive at the exact comprehension of the object aimed at, and supposed to be gained, by the use of hollow tiles, which are intended to be filled with concrete. One would be inclined to imagine that if the hollow box requires to be filled with concrete to give it strength enough to act as a building material, it would be simpler to omit the enclosing envelope, and use the concrete in the shape of a solid block, as in May's system. There appears to be very little use in enclosing so cheap a material as concrete in so expensive an envelope as that composed of pottery ware. It may be assumed at once that in every description of concrete work, similar to that under notice, it cannot be for a moment intended to compete with ordinary brickwork, so far as cheapness is concerned. The first cost of moulding the hollow shapes to hold the concrete would, estimated cubically, equal, if not exceed, that of the manufacture of bricks.

It will not fail to strike the reflective mind that the tendency of all "building in concrete" is to effect a kind of compromise between brickwork and masonry. The common brick is considered to be too small, and to give rise to too great a multiplicity of parts, while very large and heavy stonework errs, in an economical point of view, on the other side, and is not, therefore, suitable for constructive purposes upon a small scale. The object has, therefore, been to discover a mean between the two extremes, which, while possessing all the advantages of the hardness and durability of stonework, should also be endowed with that ready manipulation and facility of execution which has rendered, and always will render, bricks the favourite material for small buildings. Notwithstanding the various methods tried, it cannot be said that the happy medium has been arrived at. One advantage is invariably gained at the sacrifice of some other. If a large cubical content be obtained by the use of larger pieces, there is an increased difficulty and risk in the carriage, setting, and stability. If, on the contrary, small component parts be employed, the cost of them must be relatively very small, as there would be no advantage gained over brickwork in the labour and workmanship expended. Brickwork possesses one great advantage over hollow boxes filled with concrete, and, in fact, over concrete blocks, slabs, and other forms in general, and that is, the broken ones can always be used, and in certain parts of the building are just as valuable as when entire. This is not the case with the hollow boxes, tiles, and shapes. Once broken they are comparatively useless, and cannot be employed for holding concrete. In fact, one might just as well expect a broken pipe to hold water. It is needless to point out that this would prove a serious objection to their extensive introduction as a building material. Looking for a moment at the strength of a wall built upon Parr and Strong's principle, and comparing it with one of brickwork or concrete, a considerable difference would be observed. In the latter case, neglecting the joints, the strength will be, for any given unit of dimension, nearly as the absolute strength of the material. But in the former the strength is dependent upon that of two substances very different in their powers of ultimate resistance. The wall might fail, either by the failing of the concrete or of the hollow envelopes enclosing it. It is quite clear that if the envelope gave way by crushing or any other cause, the concrete would not suffice to keep the wall up. It might not exactly fall immediately, but it would become so distorted that it would be necessary to shore it up, and it is questionable if it would be possible to restore it permanently to a state of perpendicularity. There is always this danger to be feared in the intimate combination of two materials possessing different powers of resistance, and varying in other qualities besides. A cause which might not produce the slightest effect upon one might seriously damage the other, and the former would therefore suffer in consequence of the inferiority of its companion. The experience of engineers in compound structures composed of cast and wrought iron has taught them this practical lesson, and the principle holds true when applied not only to these two metals, but to any other substances having different relative properties. It is true that one of the chief causes affecting the union of cast and wrought iron does not operate in this particular instance—namely, the different degrees of expansion and contraction; but still the powers of durability, resistance to crushing, and damp, vary considerably. There would, of course, be theoretically a difference between the expansive and contractile powers of the concrete and its surrounding envelope, but it would be practically inappreciable.

A glance at the hollow systems is sufficient to demonstrate that their claims do not rest upon any merit they may possess for building upon a small scale, since independently of cost they are not adapted for cottage or ordinary house building. In a word, they are not cheap methods of construction. Omitting, therefore, this comparison, they unquestionably possess advantages, when regarded in a more extended light, and there is abundance of scope for a description of building material which may be well adapted for gentlemen's country residences and rural mansions, although not necessarily suitable for the erection of labourers' dwellings or model lodging-houses. One peculiarity of Messrs. Parr and Strong's work is that the component parts are all headers—there are no stretchers; the bond is the depth of the wall and continuous. In a constructive point of view this is a defect. A certain proportion of headers to stretchers is absolutely necessary to make sound work. A wall all stretcher, like a half brick wall, unless set in cement, has little or no strength, and is only fit when built in mortar for panel work. But although this is the case, yet it by no means follows that a wall all headers should possess the maximum amount of strength. Quite the contrary; a certain number of stretchers are just as important and indispensable to sound work as a due proportion of headers. The one bind the wall in a longitudinal direction, and the other in a transverse direction, and from their combination proceeds that almost indestructible incorporation which is always a sign of first-rate brickwork. Thus it is that a half-brick wall has no strength. Although bonded longitudinally, it is not so transversely, and, consequently, fails by lateral distortion or sagging with a slight pressure.

Not merely so far as this, but as all other principles of building in concrete which we have noticed are concerned, further actual trial and experiment are necessary before a reliable conclusion can be arrived at respecting their relative merits and the several advantages they possess, with regard to their durability and general fitness for the purposes they are intended. It is one thing to assert that a certain material will resist all the influences of climate and moisture, last longer than any other, and another thing to actually put it to the test for a given time and observe the actual effect produced upon it. Our Houses of Parliament are a standing example of the difference between the assumed properties of a building material and its actual behaviour under trial. That magnificent structure is literally "perishing by inches," and it appears as if nothing can be done to arrest its inevitable decay. Another and still more important advantage will be gained when some concrete buildings are erected, and that is the determination of the cost, the most deceptive item in the whole system, and one which nothing but a crucial test will finally decide.

THE FAIRFORD WINDOWS AND ALBERT DURER.

THE meeting of the British Archæological Association, this year, at Cirencester, has been something more than a mere summer picnic. Good and true service has been done to art by Mr. Henry F. Holt in his attempt to dispel the apathy with which the painted windows at Fairford Church have been regarded for the past 300 years. The windows are 28 in number, the majority being divided into several compartments, and the subjects, which are taken from the Old and New Testaments and the Apocryphal Gospel, are all to be found, with one or two exceptions, in the "Biblia Pauperum" and the "Speculum Humanæ Salvationis," two well-known early repertories of popular Scriptural woodcuts. The popular origin ascribed to them is well known. John Tame, the founder of the church, is said to have taken in 1492 a Flemish ship bound from some port in the Low Countries which had on board the glass of the windows and the workmen entrusted with their erection at Rome. He carried both glass and workmen to Fairford, and built there a church to receive the windows, which were fixed soon after, A.D. 1500.

The legend contains, as Mr. Holt says, many improbabilities and inconsistencies. He points out that John Tame did not purchase the manor till 1498, at which time England was at peace with both the Pope and the Flemings, and, therefore, he was not likely to attack a Flemish vessel; in the next place, painted glass was then by no means so uncommon that a man should especially build a church to accommodate a set of windows. Moreover, the windows contain the ostrich feathers and "Ich Dien" motto of the Prince of Wales in honour either of Prince Arthur, or of Prince Henry, afterwards Henry VIII.

The probability is, as Mr. Holt suggests, that Tame, who was a rich merchant, sent to Flanders for his windows, and that the work was entrusted to and executed by a foreign artist, this artist being, Mr. Holt contends, no other than Albert Durer.

Mr. Holt's principal argument in favour of his proposition is the strong similarity between several peculiar forms of nimbi of the Deity, as shown in the windows, and those contained in the earliest copies of the Scriptural illustrated books before referred to

—the "Biblia Pauperum" and the "Speculum Humanæ Salvationis," and which he also believes to have been executed by Albert Durer. With regard to this Mr. H. Noel Humphries states that it is impossible that Albert Durer could have executed them, as the date on a well-known copy of the first edition of the "Biblia Pauperum" fixes it at between 1420 and 1430, and Albert Durer's father did not settle at Nuremberg until 1455, and was then only a young man. Neither this nor the similarity in the form of the nimbus, in his opinion, proves anything whatever as to whether Albert Durer designed the Fairford windows or not.

Another correspondent expresses his belief, supported by a careful examination into dates and other records, that the windows are the work of the Brothers Crabeth, who also executed a similar series of thirty-one windows for the Cathedral of St. John the Baptist, in the City of Gouda, situate at the junction of the Rhine with the Zer Gond. Mr. R. N. Garfit publishes an extract from a "Traveller's Guide," published in 1805, which assigns the windows to Albert Durer, and records Vandycke's opinion that the colouring of the drapery and some of the figures is so well performed that the pencil could not exceed it.

Whether the work of Durer or some other equally gifted but less known artist, none can gainsay the singular beauty of the windows, marred as they are by decay and "restorations." Now that the attention of the British Archæological Association has been called to them, it is to be hoped that some speedy and effectual steps will be taken to save them from further decay, and to find the means necessary for careful restoration under competent superintendence. As another correspondent remarks, this is a case in which all lovers of art, English and continental alike, might be appealed to for subscriptions and practical help. Meanwhile we repeat that the public are under considerable obligations to Mr. Holt for directing attention to a valuable collection of art treasures, of which many of us were before totally ignorant.

ARCHITECTURE AND ARCHITECTS.*

UNFORTUNATELY for both architecture and architects, a large proportion of those for whose comfort, enjoyment, or advantage the art is to be called into exercise, care little, and really understand less, of what is meant by the term architecture, and confound it either with mere building of the commonest utilitarian kind, or with the mere surface decoration which stucco or paint can cheaply and rapidly add to the surface of such work. By clients such as these, though often requiring structures of a scale and class which should demand full exercise of an architect's power of design, the merely useful is alone seen as their own aim, and in so far, and in so far only, as the works produced suit their needs in respect of accommodation in space and convenience in communication, do they believe that architectural art is present; and vainly bestowed, inasmuch as the inmates are concerned, are all the nice studies of vista, effect, proportion, and succession of parts, which the anxious architect has lavished on the, perhaps, costly edifice which is to be coupled with his name and skill in art while its parts shall hold together. The merely everyday uses of common life are the real of architecture to such possessors of its examples, and their unappreciative acquiescence in its simple fitness falls cold on the senses of the lowly estimated, though perhaps highly-paid, artist.

I hold it vain to attempt the task of defining how much instinctive feeling, association, or education may have to do, individually or generally, with the acknowledged power of architecture on the human mind; and I proceed to express, weakly and imperfectly it must be, my own view of what, through all these channels, carries this force of ideal impression deep into thousands of differently disposed and variously cultivated minds.

This source of the power of architecture as an art of imagination rests, I am convinced, in its consonance with those laws of effect, infinite in the variety of their results, which the Creator has impressed on the material universe, and specifically for us on the surface of the globe which we inhabit.

Form, light (with its complement, shade), and colour are the material source of all those enchanting landscapes with which this world can gladden the eye of him who seeks such pure enjoyment. Form, light, and colour give architecture, as I have said, place and power among the arts. Contrast, proportion, and gradation in form—alike in the mountain, the headland, the islet, and the cathedral—arrest the eye and interest the mind. Why, we can scarcely tell, but so it is, and often with overwhelming force. Light, shadow, half light, reflexion, alike mark out, define, and enrich the broken cliff, the waving forest, the palace front, and the village spire; and colour no less, in its endless harmonies, gives life and vividness alike to natural and architectural objects.

The limits within which this strong and close analogy between nature and architecture can be said to prevail, must vary as widely as can the objects of architectural production; and the actual idea may range from rustic simplicity, comfort, elegance, through the whole scale of the beautiful, the grand, the magnificent, and the sublime.

In each class of the architect's works, under these many forms of the ideal, must the degree in which the elements of form, light, and colour contribute to his effects, vary and interchange; and seldom as it falls to the lot of any of us to have the opportunity of achieving what can be placed in the category of the grand or the sublime, yet such opportunities do, at long intervals, occur for our profession; and happy may that man esteem himself in his generation who leaves behind him on the surface of this troubled globe something which is hailed by his fellow-beings as a gem in the midst of its monotony, and as calculated to call that least cultivated, yet, perhaps, most essentially characteristic element of his high place in creation—his imagination—into full and happy exercise, raising him for the moment above the common-place interests of speeding time, and leading him, even through a material source, to recognise his alliance with that which is surely superior to time in its essence, though decreed to perish with it in its substance.

I class architecture most nearly with music among the arts, in respect of its directly elevating power upon the human mind; and it will be frequently found that the intellect most awake to the power of the one is sensitive also to the other; though I think observation will prove that insensibility to architectural impressions is a less common defect than indifference to those of music, the latter arising apparently from a not infrequent absolute deficiency in the organisation, I mean of brain rather than of ear, concerned in conveying these impressions to the mind. Architecture is in its associations of wider interest to the greater portion of mankind than the art of music; but though many professing the latter art will be found skilled in its execution, and even clever in its technical arrangements, without any feeling, or very little, for its higher forms of imaginative power, I hardly think you could find indifference to grand effects in architecture in anyone who could enter into and lose himself for the time in the "disembodied" flow of a fugue of Bach's, the sublime transitions and cadences of a chorus by Handel, or the pathetic and heart-searching strains of one of Beethoven's great symphonies.

I dare not permit myself to pursue this captivating theme of the analogies of the arts, but I feel sure that scope exists for the production of a work of immense interest to anyone who would devote time to illustrate the connection of the arts as Mrs. Somerville has that of the sciences, and Mr. Grove of physical forces.

Briefly to notice some of the forms of the ideal I have enumerated, I should say that, in respect to that essential element of an Englishman's home—that untranslatable word of his social vocabulary, comfort—the architect, who must in many cases have this ideal most frequently of all proposed to him in his practice will find that gentle play of light and shade, and a very restricted and chastened use of sober colour, with little dependence on the higher and stronger effects of architectural form, will best assist him in securing its effect. The structures to which the epithet mostly applies are not large in scale, and all strong and forcible effects of form produce, on a small scale, an impression of movement and unrest which does by no means attach to the same when applied to buildings on a great scale.

Elegance or grace—the characteristic which attaches strictly to structures connected with the lighter scenes of human life and its intellectual recreations—would be in a measure wearisome, if markedly pervading the whole domestic range of a dwelling house, however finished in style; but in the detached concert-room, the saloon, the theatre for the most part; yes, and the ball-room—externally and internally—this may be sought and secured. Greater play of form in small masses, less contrast by effect of light and shadow, and more and livelier employment of colour, will be found, I think, to conduce to this end; and, in contrast with the quieter effects of comfort and home feeling, the application of this style of effect may often prove most happy and artistically useful as applied to the parts of domestic or, as in the club-house, of less private buildings' which are to be devoted to such uses as I have alluded to.

Beauty, the next step below the grand, is surely not a result to be obtained in architecture without the expenditure of long and anxious study in design, and no less anxious experiment in respect of detail. Independence of scale is a characteristic of this high and captivating character of art, and, though applicable to a great extent, even to large structures of certain classes, yet in those of moderate scale it seems best to commend itself to our love and admiration. Here, form, in some of its most recondite relations—chiaroscuro in its most subtle effects, and every variety of harmonious colouring, may, according to the varying circumstances of the design, be called to his aid by the architect as means to secure his end.

Form—effective rather by gradation and proportion than by contrast—and effect of light, rather diffused than concentrated, seem appropriate to impressions of architectural beauty; while, in the use of colour, let the artist beware that only as applied to beautiful forms can this be otherwise than at least semi-barbarous; and let him look at and take warning by the, alas! too many examples in modern English structures, where, in the desire to fall in with a prevalent but passing fashion, the architect has marred a perhaps otherwise meritorious design by the use of strongly-contrasted and even coarse colour, applied in hard and graceless forms, and sometimes with a force of crude opposition sufficient to overbear and destroy all that the really architectural features of his work had to offer of beauty or of grace.

Grandeur of effect, unlike beauty, must, as the term implies, enlist large scale among its constituent elements. Here, strong contrasts and bold gradations of form find place, forcible and concentrated effects of light and shade, while colour again falls into comparative abeyance, and where employed must be made strictly ancillary to the bolder effects dependent on form and chiaroscuro, as in deepening the effect of purposely-shadowed parts of a design by its retiring shades of purple or violet, or bringing into prominence what it is sought to press on the eye by distinct but yet mellow tints of a warmer character, and pointedly by the studied use of gold in an unburnished form of etching. But here must be avoided, save in the smallest measure, the use of the primaries—red, yellow, or blue—or their negative and positive neutrals—black and white.

* From a paper on the "Real and the Ideal of Architecture," read by Mr. H. P. Horner, before the Manchester Architectural Association.

THE RESTORATION OF WESTMINSTER CHAPTER-HOUSE.

THE restoration of this most beautiful adjunct to the grand old Abbey of St. Peter's may more properly be called a resuscitation than a restoration. It is not being rebuilt, or even, in the strict sense of the term, being renovated—a word which is dreaded by all true antiquarians and archæologists; it is simply being restored to the condition in which it existed more than five centuries ago, but without any modern accessory, alteration, or improvement whatever. It is only being cleaned, strengthened, and revealed in all its beauty, and the Vandalisms which have hitherto, in the way of stairs and shelves and blocked-up windows, desecrated its exquisite proportions, are being removed for good and all. The cost of what may be called literally cleaning and

strengthening it will be in all about £30,000, and there are few even of the most economical members of Parliament or their constituents who will grudge this sum. The great mass of the rents of the old Abbots of Westminster goes now to the Crown—that is to say, to the country, and it is not unfair that the country generally should bear the expense of maintaining in all its ancient integrity even the smallest vestige of the great Abbey, which is without its equal, either for antiquity or historical associations, in the world. The Chapter-house was once one of its most beautiful accessories. It is larger, but on almost the same plan and style as the celebrated Chapter-houses of Wells and Salisbury. The latter is known among all architects here and abroad for its beauty; but that at Westminster, though finer, has been little seen and still less known. In fact, till now it has never been much regarded, and it was not till it threatened to crumble into ruins that efforts were made to keep it from literally falling in a heap. Yet there was much even in its associations, apart from its rare architectural beauty, to justify its preservation. It was, at the latest, built in the reign of Henry III., and in it the House of Commons used to meet in 1377, and continued to meet till they were moved over the way to St. Stephen's Chapel, now St. Stephen's Hall, in the crypt under which, at its building, Chaucer was clerk of the works. In the Chapter-house, also, was kept the Doomsday Book, with the original wills of Richard II., Henry V., Henry VII., Henry VIII., the Golden Bull of Clement VII., giving the title of Defender of the Faith to Henry VIII. for his treatise against Luther and the Reformation, and the treaty of perpetual peace signed on the Field of the Cloth of Gold between Henry VIII. and Francis I., the exquisite gold seal to which, six inches in diameter, is said to be the work of Cellini. But "*Tempus edax rerum*," and the old historic Chapter-house came to be disused, and in process of time to be dismantled and almost destroyed. It was and still is octagon in shape, with eight large and lofty traceried windows in the richest Gothic style. The thrust of its light roof was held by a peculiar bracing of three stout wrought-iron rods, each nearly two inches in diameter, passing round the walls above the tapering windows, and being joined in a most peculiar manner by iron rings. These were removed during some ill-advised and most antique improvements, and at once the roof began to thrust the walls outwards, and flying buttresses had to be built to retain them. There is no record as to the time when these buttresses were built, and all differ much as to periods, and vary in strength from 9ft. to 18ft. thick, the last having apparently been built up as late as 200 years ago. After this, in spite of its exquisite tempera paintings and carvings, its rich tracery, and brilliant windows, it sank into neglect, and became at last a mere storehouse for Government records, and this was almost the ruin of one of the noblest structures connected with the Abbey.

The Westminster Chapter-house, like that at Salisbury, may be described as a gigantic octagon lantern, about 64ft. in diameter and 64ft. high, with a rich groined roof, meeting in the centre, as at Salisbury and Wells, on a clustered pillar of black Purbeck marble. Such a building, of course, did not suit the requirements of a great Record Office, so the windows were broken out and bricked up, an upper story was made by a common deal floor let into the walls, and the paintings and carved groined arches were hidden in by presses to hold the books. Only one good came of this change, which is that the encaustic pavement was boarded over, and thus there remains to us one of the finest examples of mediæval tiling that exists in England. That this is the original pavement is evident from the recurrence of the arms of Henry III. Its colouring is superb, and its flowing patterns are burnt in with a delicacy and brightness which would do credit to Minton even now. Among the patterns are little figures of kings and queens, saints, ecclesiastics, and minstrels. This preservation, however, is all we have to thank the Record Office of those times for, and we should perhaps have not had even that but for the fact that boarding was warmer to the feet than tiles. In all other matters it was misused with neglect which one would hardly think even the most untaught clowns would have been guilty of. For the sake of gaining a few inches for the wooden shelves, all the exquisite carving of the capitals of the black marble columns was hacked away,—even the groining of the arches above them, all gilded, coloured, and beautifully carved like the "diaper" patterns of the Alhambra Palace, was in most cases chiselled out to make room for a beam or a wooden shelf. Some good, however, was effected even by this, for the shelves protected the paintings on the walls, though not entirely, for a doorway was cut through one of the best, just as in Italy a doorway was cut in one of Domenichino's great frescoes of the Last Supper. The paintings in the Chapter-house are evidently the work of an Italian artist, and are in a tolerable state of preservation, thanks to the shelves which were in front of them. In some parts the colours are wonderfully brilliant, and the heads are painted with great force and character. In one bay, evidently reserved as a seat for the Abbot, the groinings of the arches are beautifully coloured and gilded, but these, like the others, have been hacked and hewn and chiselled and defaced to make room for shelves. Here, and on other portions of the carvings and walls, are ample remains of colour and gilding. Some of the caps of the columns, both here and elsewhere, are simply moulded, but all are graceful. It will be very easy to restore these columns and groined arches to their original condition. Art critics are proverbially hard to please, however, and it is contended that to restore these mutilated walls is to falsify history and sophisticate art. As well might one complain of mending a rare old Wedgwood vase, or repairing a rent in a painting of one of the old masters. Much interest attaches to the once double portal at the top of the steps of the vestibule which connects the Chapter-house with the cloisters. The pillar dividing this portal has disappeared, as also its head, which once enclosed in a large centre quatrefoil a figure of our Saviour. A confirmation of this last fact is furnished by an antique record, which directs the monks on entering the Chapter-house to bow to such a statue. In the wall space to the right and left of this door head are figures of saints and angels, which, strange to say, have escaped both the Puritans and the keepers of the records. The bronze wings of the angel Gabriel, however, have been carried off, though the removal of a vast mass of whitewash has brought to light many figures which it at once concealed while it protected them. After all these devastations the Chapter-house soon began to yield to what might have been its fate. The buttresses gave way, and the side wall sank to the south. The outer walls bowed out in an alarming manner, some as much as nearly 10in. from the perpendicular, while the central column, of black Purbeck marble, with its clustered shafts, was not only bent aside, but even twisted. The place, too, became too small for the records of which it was full, and they were at last removed. Still, even lightened of this weight on its walls, the structure continued to yield, and at last to save it from ultimate ruin, Mr. Gilbert Scott was called in. Mr. Scott is about the most conservative architect in his profession. He neither renovates nor restores, in the architectural sense of the words, but only replaces, and even that only as far as is possible consistent with the strength and durability of the structure. With the Chapter-house it was a difficult thing, for the buttresses were literally rotten, and were so built around that it was difficult to get at many of them, for all the stone, which was of a soft kind, was so decayed that more than 3in. of the material was eaten into, and the foundations too had given way to some extent under them, so that new buttresses were absolutely necessary. These were erected by raising the modern roof of the Chapter-house, and then substituting for the old buttresses new ones in Chilmark stone from the Wiltshire quarries. This stone is peculiarly hard, but it has not yet been tried much in that hardest of all ordeals, the atmosphere of London. A very ingenious specimen of cross centring scaffold takes the inward thrust of these flying buttresses till the groined roof is finished, and will rest upon the centre cluster of marble columns. These columns have been sadly misused, and, though finely polished, were during the time of their degradation as a Record Office painted black. They were bound round with copper wire at the capitals and bases as the tall shaft began to bend and twist in olden times, but beyond this nothing was done to repair the fabric which they mainly upheld. The restoration of these columns to their proper position will be one of the most difficult works in all the building. For the rest, every atom of the stone in the old structure has been used again in the new. It has simply been "redressed" in the interior, and in the external buttresses a harder stone has been substituted for that which was found to be decayed. Beyond this no alterations have been attempted. The groined roof over the centre will be the same as that which covered the House of Commons nearly 500 years ago. Above this will rise a pointed roof of iron, cased with lead. The main ribs of this are so tied in with cross braces that there is no thrust upon the walls below, which have only to bear its weight. The windows are to be filled in with coloured glass, and enough has fortunately remained of the old lights—that is, of portions of them—to show how they were once filled with grisaille, ruby, blue, and other colours. The style of the period on the spot is known. It consists of a sort of mosaic of grisaille, with small coloured pieces at rather wide intervals. There is an example of the style in the Jerusalem Chamber, and, curiously enough, a portion of a window of the required date situated in the apsidal chapel of the Abbey, but built in by Henry VII.'s chapel, was recently discovered. Altogether the restoration of the Chapter-house to its pristine beauty will cost some £30,000; but, as we have said, there are few who will grudge this for the preservation of a building which is not much younger and scarcely less historic than the venerable Minster itself, to which it will now add new glories. Beneath the Chapter-house is a crypt which is little known or seldom mentioned even in the most ancient or modern histories of archæology. This crypt is about 30ft. square and some 12ft. high. It has no windows to it, and the walls in some parts round it are as much as 15ft. thick. This is, perhaps, the only part connected with the Abbey which has anything like vaulting under it. The ceiling of this crypt has a plain groined roof, the arches of which meet in the centre on a splendid column of black Purbeck marble, about 8ft. high and some 4ft. in diameter. This crypt, however, like the fabric it supports, has met with cruel misusage. The great marble column has actually been cut into gaps, so that little more than a shell of it remains, in some parts not more than 5in. or 6in. thick. These were used as safes for the most precious of the records deposited there. All these chasms will now be filled up, and the pillar put in a fair position to do its duty in supporting one of the most ancient and most beautiful portions of the famous Abbey of Westminster.—*Times*.

THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

ON Monday, Mr. Thorold, C.E., read a paper on an "Auxiliary Railway for Turnpike Roads, and passing through Towns." The author stated that his object was to utilise the existing highways for the purpose of a tramway; and to accomplish this object he proposed laying down a single rail on one side of the existing roads, out of the way of the ordinary traffic, and as this rail would admit of curves of 20ft. radius, it would be peculiarly adapted for new countries by passing up ravines and mountain sides with any gradient not exceeding 1 in 12. It was proposed to have four wheels following each other along the centre of the truck, which wheels would carry the load, and the balance would be preserved by a pair of ordinary wheels, so arranged that they would act equally well upon level and uneven surfaces. The carriages it was proposed to propel by means of a traction engine, but the system was equally available for drawing by elephants and other beasts of burden. The adhesion of the traction wheel could be regulated to any weight, and by an arrangement of the other wheels the engine could even lift its traction wheels out of a soft place. The cost of a tramway of this description is estimated at £500 per mile. The details of the invention were explained by the aid of a number of diagrams and models. It was proposed to use a hollow rail, and carry in the cavity a telegraph for communicating from one end of the system to the other; the telegraph being not only cheaply laid, but secured from all interference or danger of injury from storms or other causes.

LONDON STREET TRAMWAYS.

A paper by Mr. Bright, C.E., was also read on "London Street Tramways." It referred to the inconvenience arising from the increased traffic in the streets, and the defects of the omnibus system as at present carried out, and suggested the draw-

ing of carriages conveying large numbers of persons along a tramway. They might be drawn by horses, and could be stopped at any point desired, and not necessarily driven from station to station, as was the case with the Metropolitan railways. Wherever possible, the tramways should run along bye-streets, catching the main thoroughfares at the point of junction. To avoid interfering with the contour of the roads it was proposed to adopt a bevelled rail, laid on a level with the roadway, the depression not exceeding an inch, and the wheels bevelled to fit the rails, with an apparatus for enabling the carriages to leave the rails whenever the exigencies of the street traffic should require it. It was proposed to use horse power for drawing the carriages, and adopt a system of brakes that would enable a train to be stopped whenever required. He expressed an opinion that some system of tramways would speedily force itself upon the attention of the people of London.

The next paper was by Mr. W. J. Cooper, on an "Improvement in Watering Roads." He pointed out the defects of the present system of watering by carts, and referred to the necessity for some more efficient means than that which has already been adopted, which had cost London £100,000 during the last summer without succeeding in laying the dust; and recommended the adoption of a solution of chlorides of soda and calcium in the water, which would prevent the roads drying so rapidly as was the case with water only, and thus avoid the necessity for such frequent waterings as at present, thereby saving expense, and at the same time increasing the binding character of the road materials, and consequently rendering them more durable.

A paper, by Professor Archer, describing the successful working of Mr. Thompson's patent road steamer in India, was read by Mr. Le Neve Foster, in the absence of its author; but no discussion took place upon either of the above four papers.

On Tuesday, Mr. T. Login, C.E., F.R.S.E., read a paper on "The Abrading and Transporting Power of Water." After referring to the importance of water as an agent in adapting the world to a condition suitable for the habitation of man, the author observed that the power derivable from water and the resistance of water to bodies passing through it had been well investigated; but of the transporting power of water at different velocities very little was known. In illustration of this fact he spoke of the great controversy now going on between Sir Arthur Cotton and Sir Probey Cautley, two of the greatest engineers India had ever produced, with reference to the Great Ganges Canal, and observed that on the correct settlement of this dispute great interest depended. Not only was it a subject for the philosopher to study, but for the politician, the philanthropist, and Christian, as the future prosperity of that great continent was bound up in it. Having entered into a minute account of observations taken in India with reference to the slope required to transport the earthy matters held in suspension and prevent the canals from silting up, he arrived at the following conclusions:—That the transporting power of water must depend to some extent on the nature of the earthy matters to be transported; that water containing large quantities of such matters required greater slope than those containing small quantities, and that without a sufficient slope the earthy matters became deposited on the bed of the stream; that any obstruction in a silt-bearing stream will at once cause a deposit, which, if allowed to accumulate, will eventually cause an alteration in the course of the current; that water containing no such matter would continually deepen its bed had not nature provided that at certain seasons the rivers flowed under both conditions, and so preserved the balance. These observations led to the deduction that the slope of every canal intended for irrigation purposes should depend upon the velocity of the stream, the amount of earthy matter held in suspension, and the character of such matter.

Professor Rankine observed upon the necessity that existed for greater attention being paid to irrigation in this country. Anyone who travelled through the country within the last few weeks must have seen land where vegetation had been dried up, although in many cases there was an abundant supply of water within a few yards, which, however, was not available for want of the means of applying it. He suggested the appointment of a committee to investigate the power of water in transporting matters of different kinds, which distinction had not previously been known to science. Mr. Vigooles agreed in the desirability of irrigation, which was more especially valuable in Italy, Spain, and other countries, but in England he thought there was not uniformly such a scarcity of water as would render necessary any extensive works of the kind.

The Chairman also enforced the necessity of irrigation, especially in India, and congratulated the section on having begun the last day of its sitting with papers on subjects so important.

Sewage.

A recommendation forwarded to the Economic Section was read by the President, and was to the effect that impartial reports should be made and communicated to the British Association on the treatment and utilisation of sewage in connection with the drainage of towns, in order that such facts and information as may guide future operations may be recorded from time to time. It was, therefore, proposed that some member of the committee out of the three following sections should be appointed a committee to draw up the report:—Section B, J. H. Gilbert, F.R.S., F.C.S.; Section F, W. D. Harding, C.E.; Section G, Richard B. Grantham, C.E., F.G.S., with power to add to their number; and that a sum of £30 be granted for the payment of such expenses as are incurred in the course of the investigations. The committee should be requested to include in the details of each report—

1. The special circumstances of each case, such as the extent of district, the population, and the number of houses with or without the benefit of drainage.

2. The character of the sewage and water supply adopted in the district; and the quantity of sewage at disposal.

3. The mode of disposing of the sewage, with description of the works and their cost.

4. The result pecuniarily to the district, and to those who are selling or applying the sewage to the land or otherwise in any form whatever.

The recommendation was adopted by the section.

On Wednesday a paper on "Education and Science" was read by Dr. Grierson, who said that the only effectual mode of education was that which appeals to nature. He recommended teachers to take their pupils to a museum, a garden, or the sea-shore; direct them to observe what was before them, and on their return make them enumerate and explain as much as they could. In like manner, stuffed animals and skeletons might be placed before the pupils, who should be required to mark the points of difference in size, colour, and other characteristics, and also the points of resemblance. In this way, he said, the mind would be trained to habits of observation, self-reliance, a love of knowledge, and a capacity for progress.

ROAD TRAMWAYS.

As two of the great railway companies have outraged public opinion and exhausted public patience by exorbitantly raising railway fares, people are discussing the best plans to contravene the directors' intentions. Some are giving up their houses and coming nearer London to live, others are riding in the omnibus instead of the railway carriage; some are riding in third class instead of first class carriages, and others are walking. No doubt these modes combined will bring the directors to their senses. In all probability the directors would not have taken the step they have if they had expected they would have subjected themselves to so much odium. And it is not unlikely they will embrace the first favourable opportunity to retrace their steps. But what more than anything else likely to induce them to walk in this direction would be wholesome competition. Road tramways were started in London under somewhat unfavourable auspices. Mr. Train almost went out of his way to make enemies, though he did a great many out-of-the-way things to conciliate friends. His being a bragging American did not facilitate his intentions. But he nevertheless commenced a good work, which may now be improved upon, and we know nothing more calculated to induce railway directors to be more sparing of railway funds in future, and to be less disposed to raise fares, than the laying down of road tramways. At present the railways have it almost all their own way, there is no road in the field. A writer in the *Times* says:—

"There is no power at present that can compete with steam in cheapness, and it is only by using steam against steam that any competition can be successfully carried out. Remove the existing absurd legislative enactments against the use of steam on the common roads, and shortly would appear on the different suburban routes steam omnibuses, which would pay well at 2d. ahead for inside and 1d. to 1½d. for outside passengers, on journeys of four miles.

"It may be said that steam has been tried years ago on the common road, and failed. Quite true. But the difference between the light steam-engine of the present day and its ancestor is something like that of the elephant and racehorse. An engine of two horse power effective (about equal to the power of three omnibus horses) may be made, with boiler, &c., complete, within 10cwt. Such an engine will consume 10lb. of gas coke an hour, value 1d. The cost of working would be as follows:—Driver at 35s. a week of six days of twelve hours, or seventy-two hours, or per hour about 6d.; conductor, the like amount, 6d; fireman or engineer, the like, 6d; fuel per hour, (when in work only), 1d; wear and tear per hour, 2d.; shed, cleaning, &c, and all other contingencies would be covered by 3d —total, 2s. Supposing the 'bus to run eight miles an hour, or two journeys of from three to four miles an hour, with six passengers inside at 2d. and six outsids at 1½d., on each journey the receipts would amount to 3s. 6d. per hour. But most probably the average number of passengers would be much more than double; but say double or 7s. per hour. This would give a clear profit of 5s. an hour, or £18 a week, or £936 per annum from a single omnibus. The omnibuses I should propose for the present roads would carry about forty passengers, but with tramways nearly double the number would be easily drawn by the same power and at the same expense. The economical advantages, as against railways, would be in the absence of nearly all expense except of the carriages in actual use, but which forms only a small item in railway expenditure. Many omnibus proprietors are quite alive to the advantages of steam, and several have told me of their willingness to start steam omnibuses on the common roads as soon as the legislative restrictions are removed. The steam-engine I allude to would be free from noise, smoke, or other nuisance, and, therefore, quite different from the railway locomotive."

Another writer in the same paper says:—"I am pleased to see this subject ventilated in your columns. The principal objections to the tramways now in use in this country are:—

"1. The rails standing either on the outside or inside above the level of the road cause serious obstructions to the ordinary carriage traffic.

"2. The impossibility of the flanged wheels of the tramway vehicle running on the ordinary rood, necessitating a change of wheels (as in Paris) where the vehicle has to traverse both tramway and road.

"3. The difficulty of vehicles on the tramway passing each other necessitating a double line to carry a large traffic, such as would probably result in the suburbs of London, and in the country increasing the cost of a single line by the numerous passing stations which would be required, as well as impeding the traffic.

"A tramway in operation at Geneva appears to me to obviate all these difficulties.

"Objection 1 is removed by the rails being perfectly level with the ground, so that all carriages can pass over them without obstruction.

"Objection 2 is also removed, as the wheels to the tramway vehicles have no flange. The carriage is kept on the rails by a centre wheel of about two feet in diameter (I believe of steel), which runs in an iron groove level with the road. This wheel is thin at the edge, and can be lifted clear of the road at the pleasure of the driver.

"Thus objection 3 is got over. On two vehicles meeting each other one of the drivers raises his centre wheel and leaves the tramway, regaining it after passing, and dropping the centre wheel into its place.

"As this system has been some little time in use in Geneva the objections to it can be ascertained from practical experience, and perhaps remedied."

The Chester Cathedral Restoration Fund now amounts to nearly £28,000. This includes the grant of £10,000 from the Ecclesiastical Commissioners.

RUST'S PATENT MATERIAL FOR DECORATIVE PURPOSES.

WE have this week inspected, at the office of Messrs. D. and G. Latimer, 29, St. Swithin's-lane, specimens of a new material for decorative purposes, likely, we think, to prove of considerable service to architects, and in many cases to supersede the use of tiles or scaghola. The composition, which is patented, consists of broken glass, mixed with as much sand as it will take up, together with colouring matters or pigments. These are melted in a crucible or glass furnace, and afterwards moulded into the required shapes by the aid of pressure. In order to colour the material, a small quantity of oxide of cobalt is used to give the pattern and colour of lapis lazuli; oxide of copper will give brown, dull red, green, or iron colour, according to the quantity used; oxide of iron gives yellow, or amber; and oxide of manganese a purple, grey, or brown. The light and dark green materials mixed in the crucible produce the shades for malachite, and the lapis lazuli is produced by a similar mixture of light and dark blue. Imitations of serpentine marbles are produced by mixing the colours in the crucible or pot at one time, and moulding them into shapes or forms.

The various imitations of marbles, agates, &c., are almost perfect, not only to the eye, but also to the touch. We especially remarked one specimen of pavement, the outside border of which was formed to imitate light coloured marble unpolished, and which we were told has been extensively used on some work done at Newcastle.

The application of the material is practically unlimited. Bosses, dados, tiles, panels, and mosaic work for reredoses, and other similar purposes, are the uses to which it is at present principally applied. When used unpolished for pavements it possesses a roughness of surface and foothold entirely wanting in most of the tiles in general use. On the other hand, it is capable of receiving quite as high a polish as granite or marble, and it possesses a depth of colour and solidity of appearance quite unattainable in tiles.

It has also the merit of being extremely cheap. A 9-inch boss in imitation of polished granite or marble can be produced at just about half the cost of the real material; for paving, also, it can be produced at a cost much less than that of ordinary tiles.

Considerable use has been already made of the material by Mr. G. Gilbert Scott, in the shape of ornamental bosses for the Albert Memorial at Hyde Park, entirely, we believe, to his satisfaction.

We are told by the manufacturers that with increased experience and the use of larger and improved plant, they expect considerably to extend the number of shapes and combinations of colours which they are at present able to effect.

We trust the material will receive a fair trial at the hands of architects, believing as we do that it will prove an acquisition to art and of considerable service to the profession.

NEW SYSTEM OF VENTILATION.

MR. J. D. MORRIS, surgeon-dentist, of Edinburgh, has devised another new system of ventilation, which he thus describes:—"A peculiarly constructed grate or stove is so arranged in the making that, while it shows a very large metal frontage for heating the air, by radiation and otherwise, it does not draw air from the front, which is entirely devoted to heating the air of the entire room, but is fed entirely and altogether from below and behind. By this arrangement, a perfect hot air circulation is established, similar to a hot water circulation, which never by any chance meets any interruption, but continuously goes on drawing cold air from below and behind, which, supporting combustion, yields the heat which warms the air in front. This combustion apparatus is furnished with a damper, so as to regulate to any degree of nicety the amount of combustion, and consequently of the heating of the room. By another arrangement in the grate or stove, a large quantity of air is made to meet the heat at its hottest place, and so prevent smoke. The ashpan which receives the incombustible residue of the coke is also peculiarly constructed, and performs a double function—viz., admits air in any quantity from all points except the front, whilst, at the same time, it of course receives and accommodates the ashes. From this construction of grate it is obvious that all draught in the room is done away with, so far as supplying the combustion of either stove or grate; but there is still another provision made in this combustion apparatus, and that is, that the draught proposed by the rarefaction is also supplied from below behind, and all round the flame or hot bed of the stove or grate. There is, therefore, no air whatever supplied in front or from any part of the room. The air of the room is, therefore, simply warmed, and, taking an upward direction, according to the gravitation of the particles, is of course warmest at the ceiling, where, meeting the apparatus now to be described, it performs a most important function. The ceiling apparatus is a peculiarly constructed gas or oil lamp, which, while lighting the entire room by means of a reflector or reflectors, so collects all the heat which has been evolved during the illumination as to hand it over, by conduction, to the metal of a tube, which tube also receives not only the used warm air of the room, but also the entire products of combustion. This tube, which performs the ceiling part of the ventilation, is now converted into a shaft funnel, which, expanding into another much larger tube, made entirely of copper, delivers upwards all its heated air. This heated air whilst being conveyed through the tube, uniting its heat with that of the heat itself, which is conducted along and by the copper, is all sufficient for the purposes of continuous ventilation into, through, and out of any chimney where no fire is in the fireplace—the front of the grate in this case being, like the other grate before described, simply covered in to prevent any admission of air from the front. Where there is a fire, the used air, however vitiated by cancerous, scrofulous, or consumptive patients of a hospital, is passed through the flame bed of the grate or stove, and there entirely consumed—the air which accompanies the diseased breathings going to support the combustion, as in the other grate below, where it is cold and pure. In like manner, all the flats of a tenement, however high, can be carefully ventilated—the street, in the first instance, supplying pure cold air to the ground flat, the vitiated air of this flat or room passing into the fires of the room or rooms of the flat above, and so on, till it finally escapes purified nitrogen and pure carbonic acid—ready-made food for the vegetable world."

LEICESTER SEWAGE EXPERIMENTS.

SOME important experiments in the purification of sewage by a new process, which have just been tried at Leicester at the request of the Royal Rivers Commission, deserve attention and further investigation. The sewage of Leicester has been treated for many years with lime, and the tanks constructed for this process rendered it a very suitable place to try the new A B C mixture, as it is called. The compound consists chiefly of animal charcoal, clay, and blood, with a small quantity of alum. Its action when added to sewage is remarkable—the impurities seem instantly attracted to each other, and in two or three minutes form into large flakes, and sink, leaving the supernatant water clear and free from taste or smell.

Laboratory experiments showed that this water was comparatively pure, and a trial at Tottenham confirmed this view; but the Rivers Commission, anxious to see the process tried on a larger scale, requested the patentees, Messrs. Sillar and Wigner, to undertake an experiment at Leicester extending over a week. The trial took place a few days since; one-half of the Leicester sewage was treated with lime, and the other half, in a corresponding set of tanks, by the A B C process. During the week more than ten million gallons were purified, and the effluent water was so clear, and apparently pure, that several of the visitors tasted it, and fish put into it only ten minutes after it was drawn from the sewer lived for hours.

The average of Mr. Wigner's analyses of sixteen samples, taken at intervals of one hour during the day, is as follows:—The sewage contained 111.92 grains per gallon of solid matter, of which 42.56 were organic and 69.36 inorganic. The effluent water, after treatment by the A B C process, and unfiltered, contained 68.61 grains, only 10.20 of which were organic and 58.41 inorganic. The result of the removal of so large a proportion of the organic matter is, of course, the formation of a residuum rich in the very ingredients which are wanted for manure. The analysis of a sample from Leicester is as follows:—Water, 14.00; organic matter, 47.10; alkaline salts, 4.76; earthy salts, containing phosphoric acid, 1.31, 12.71; silica, 21.43—100.00. The nitrogen in this sample is equal to more than 4½ per cent. of ammonia. A considerable resemblance is at once apparent between this result and the analysis of a sample of guano. About 90 tons of the manure were produced at Leicester, which possesses an agricultural value sufficient to cover all the expenses of the process and to leave a large surplus for profit. The report of the Rivers Commissions is not yet published, but if their opinion on their own speciality, the purification of the water, is satisfactory, the process will doubtless be largely adopted; and the sewage of large towns, hitherto looked on only as a nuisance to be got rid of at any cost, will be considered as a valuable article, and a source of considerable revenue.

THE ROYAL BIRMINGHAM SOCIETY OF ARTISTS.

THE "private view" of this society's exhibition—the first since it obtained a mark of royal favour—was held on Wednesday. The collection of paintings is large, and there are some good specimens of sculpture. Among the pictures exhibited are the productions of some of our most famous modern artists. The collection includes "Lady Jane Grey in the Tower," W. F. Yeames, A.R.A.; "Herod's Birthday Feast," E. Armitage; "Margaret of Anjou intrusting her Son to the Robber," C. Lucy; "The Sleep of Duncan," C. D. Maclise; "Rent Day in the Wilderness," Sir E. Landseer; "The First-born," H. O'Neile; "The Restoration, 29th of May, 1660," A. B. Clay; "Jonathan's Token to David," F. Leighton; "Ophelia," E. C. Barnes; "The Tuileries, 20th of June, 1792," A. Elmore; "Before Waterloo," Henry O'Neile, &c. There are also fine productions by G. E. T. Poynter, C. Baxter, H. T. Munn, G. Sant, E. Hargitt, Sir Francis Grant, J. Pettie, A.R.A., J. T. Woolmer, Henry Moore, George Cole, T. Sydney Cooper, R.A., and W. H. Vernon (by whom there is exhibited a fine picture, "Sheep on a Moorland Road"); also P. M. Feeney, C. Loyeux, D. W. Wynfield, J. T. Hill, J. H. S. Mann, J. C. Naish, J. P. Pettet, W. Maw Egley, P. Livin, Charles Baxter, Haynes King, E. Kennedy, W. Bromley, &c. Among the best known local artists whose works figure prominently are Allen E. Everitt, C. T. Burt, F. H. Henshaw, W. T. Roden, C. W. Radclyffe, A. Johnston, H. H. Lines, Charles R. Aston, Howard Harris, W. H. Hall, R. S. Chattock, P. Deakin, John Steeple, &c. Among the sculpture is a marble statue of Sir Rowland Hill, by Peter Hollis, "to be erected in Birmingham by public subscription, in recognition of his eminent services in connection with the postal system." The likeness is good, and the general arrangement of the work satisfactory.

ARCHÆOLOGY.

THE Sussex Archæological Society had its annual excursion on Thursday week, the places selected being Rotherfield and Mayfield, about eight miles south of Tunbridge Wells. The ancient palace of the Archbishops of Canterbury was visited. The business meeting was afterwards held. It appears that, although the society numbers 148 members, it is in arrears, financially, to the extent of £74. A committee was appointed to look into matters, and a sub-committee was also appointed to consider what improvements, in their opinion, could be made in the present system of management of the business of the society.

The twentieth annual meeting of the Somersetshire Archæological and Natural History Society commenced at Williton on Tuesday, and the weather being fine there was a good attendance. The business meeting was held at the national schoolroom. The president, in his address, alluded to the peculiar objects of interest in geology and natural history for which the neighbourhood was noted. The report referred to the labours of Mr. Sanford in compiling the first volume descriptive of the contents of the Somersetshire caves, and a vote of thanks was passed to him on that account. The treasurer's statement accounted for the expenditure of nearly £309, leaving a balance in hand of £32. Mr. Freeman described the almost unique construction of Dunster Church half of which belonged to the parishioners and the other moiety to the old monastery. The arrangements for the next place of meeting, and the selection of a president for 1869, were left to the committee, and the officers for the ensuing year were appointed. In the afternoon an excursion was made to Bicknoller Halsey Manor House, Crowcombe Court and Church, and Stogumber, returning to Williton to dine at the Egremont Hotel. After dinner the Rev. Mr. Hugo read a paper on "Ina, King of the West Saxons." Wednesday and Thursday were devoted to excursions—in the first instance to Cleeve Abbey, Dunster Castle, &c., and then eastward to the Quantocks-mines, marble quarries, old camps, &c. At Dunster Castle and at Fairfield the members were entertained at luncheon.

HIGH ART *VERSUS* LOW ART.

IN my last communication I ventured to hint at the great difficulty there necessarily is in treating on so difficult a subject as high art, consequent on the strange fact of their being in existence no authoritative statement showing what it really is in the opinion of those who are now thought to produce it. We are almost wholly in the dark, and can only come to a sort of general conclusion that what is said by the artistic world at large is true, and that the public voice has, in sober fact, done all the work for us and finally settled for itself and for us this very difficult question, and that, in short, what everybody says *must* be true. This, at least, will be found to be so far comforting and satisfactory as it gives us some ground though it be unstable, to stand on, and a point of departure. No one will, of course, doubt of the difficulty of the subject, or will be likely to complain of its insufficient treatment in so short a space as we can command, where so much else claims attention. What, then, is high art, or the highest art? or what is the highest artistic power which an artist or a workman is capable of manifesting? and what are its results?

So many are the books, treatises, and flying sheets that have been written on the one subject of art that it would seem impossible to ask so simple a question as, "What is the highest artistic result in this country visible to the public?" without finding an answer, and even an authoritative command to look at and to study it. But the question would be vain, so that we are compelled to commence dogmatically, and to assume as proved the very point to be discussed. First, then, it has always seemed to me (and most people will agree with it) that the Greek marbles from the Parthenon, in the British Museum, are the best artistic results which this country possesses and the highest efforts of the artist's mind and hand. There are, of course, many reasons that might be adduced in support of this assertion generally, and one or two special ones which might have some novelty if worked out; but it will be enough for the present purpose to assume the fact that these marbles, more particularly the frieze from the Cella, are examples of magnificent *high art*. I do not know how the Academy catalogues its sculpture, whether or no the Torso comes first, or where the Hercules stands, or why it stands where it does; but, at any rate, the Theseus and horses' heads and frieze have been admitted, though barely admitted, into this antique society. The question, therefore, now is, "Why are the horsemen and cattle sculptured on this frieze considered by the orthodox as *high* art at all?" This is a most curious question, and will be found to open up a series of difficulties not a little perplexing and instructive. Everybody by this time knows that the ordinary artistic and Academy and school idea of art, painting, and sculpture is, that the highest efforts in them are always the results of "*imagination*," as it is called; indeed, no mere copying or mere representation of natural objects is thought by very many to have any artistic merit whatever. This was so firmly and consistently the opinion of the artists of the past generation that men like Fusili despised *portrait* painting itself, as merely so much copying of worthless nature, and said that, so far from nature being any assistance to him as an artist, "*nature put him out.*" In these more enlightened days it is thought a little useful to occasionally refer to natural forms, human and otherwise, but vain in itself unless purified and refined and improved by a constant appeal to the imaginative powers in the artist's mind. "Nature we can see all around us, it is said; what we want, therefore, is not a copy of it in stone or on canvas simply, but something more in addition, and that something out of the head of the artist." This opinion, as all know, is universal, from the biggest to the least, and, as if this were not enough to seal it into an absolute verity, Mr. Ruskin through all his writings is perpetually dwelling upon it, and urging it on the attention of the artistic world. "Artists," he says, "may be divided into three broad divisions—the false and feeble, who can do nothing of any value whatever; the men of literal fact, who can only copy what they see around them; and the great imaginative men, who adorn and illustrate what they see." His beautiful, but I am afraid altogether erroneous, volume, on the "imaginative faculty," many, it is to be hoped, will recollect, and more especially for the present purpose those portions of it where he dwells with such delight on the magnificence of this human faculty and on its wonderful results. All will remember the passage in it where the great spiritual thrones of art (high art) are seen occupied by the mighty presence of the great trio of artists: Michael Angelo, Dante, and Phidias—painter, poet, and sculptor—lording it over the whole world of art. Nothing can be prettier to read, and that heart must be made of the hardest of adamant that is not touched by it. For my part, I confess I revel in that second volume of modern painters as in a delightful dream, but still, ought we not to preserve our senses even in dreams?—if we can! But, alas for the "imaginative faculty," for the dreams it creates, and for Phidias himself, the mighty occupant of one of these supreme spiritual thrones! like the baseless fabric of a cloud vision, it must needs vanish. Phidias, poor mortal, was a working man evidently; work himself in his own proper person he must; there was no deputing such work to others, so that he must have been, not like our sculptors nowadays, a gentlemanly superintendent over the work of "men of fact," but a bonâ fide, matter-of-fact *working sculptor*. A painful reflection, but, as I take it, a matter of certainty and open to absolute proof. How much, therefore, of the imagination of the workman Phidias came into play in the production of this high art frieze sculpture and marble cutting? Nothing. It is all literal fact and fact only, eyesight, power of observation, and skill of hand—in short, mere copying of that in nature which was worth copying. It will not be disputed by anyone who has thought of the subject at all that the Greeks were an imitative people and borrowed wherever they could, and that they borrowed freely from Assyria and Persia. So that the fact really is that, as the Assyrian and Persian artists copied on the wall surfaces of palace rooms and staircases the forms and actions of those who in life occupied and moved in them, as we see in the sculptures from Nineveh and Persepolis, so did Phidias *copy* on this frieze, doubtless taking the idea from the Persian, the forms and actions, and the dresses as well, of those who made up the great procession which it is the object of the sculptures to represent and commemorate. There is in sober reality in this frieze from one end to the other no one single instance of "*invention;*" it is all literal fact and fact only, fully as much so as the sculptures on the Persepolitan staircase, which no one will, I suppose, call imaginative. Where, then, we would respectfully ask, is the *high art* in it according to orthodoxy? It does not exist, it must be sought in some other qualities which it remains for *a future art analysis* to find out. No man will say it is not high art, nay, the very highest, but it is not imaginative. Phidias is not, and cannot be, of those who sit on spiritual and imaginative thrones, but of that more commonplace order of intelligences who are content to go by eyesight, and if by fortune blind to feel their way.

I do not know, without going into detailed particulars, how to make all this absolutely clear, but I would refer those who are interested in art, high and low, and in the Academy mode of dividing artists, to the marbles themselves (not to woodcuts and engravings), where they will see how very, very literal and matter of fact everything is. Phidias was not a *perfect* artist, for there is little or no expression or variety of expression in the faces, none of those wonderful traits of character which Hogarth, had he been a sculptor, would have thrown into them, or observed in their living originals, nor is there that intensity of life in them which Velasquez saw everywhere. Further, I am quite sure that had Phidias existence at this hour, and sent in to our Royal Academy any one of the magnificent "cattle" panels, the hanging committee of that great institution would not take it in or give it either wall, or floor, or cellar space.

Surely high art has yet to be approached by another and a new road, and another order of artistic intelligence has to accept or reject what is offered every year for its acceptance or rejection, for the highest artistic teaching of the public mind comes from, *as yet*, this annual Academy show. In my next note I hope to draw the attention of your readers to another artist of Phidian powers, but whose work, I fear, would hardly find acceptance as high art at all, but it may lead to it.

C. B. A.

CHURCH OF ST. OURS, LOCHES.

THE subject of one of our illustrations is the south chapel of the church of St. Ours, in the picturesque town of Loches in Touraine. It is late Romanesque in style, and comprises a nave of two large bays each about 31ft. square, between western and central towers of like dimensions; also small transept, and a semicircular apsidal chancel, with north and south apsidal chapels. The latter is the subject of our lithograph. The chief entrance is from the west, under a large square porch, by a fine doorway very elaborately sculptured. The chief peculiarity of this church consists in the octagonal stone pyramids which roof the two bays of the nave, forming a conspicuous feature externally not altogether pleasing, we think, but nevertheless with remarkably fine effect to the interior. The sculpture to the capitals, string courses, and other parts is good, and the mouldings are very bold and effective.

ENAMELS, ETC.

THE five subjects given in one page of this week's illustrations are intended to be executed after the manner of the mediæval enamels of the twelfth or thirteenth century. They might, however, be done in the more fashionable *cloisonné*, and with slight modifications could be reproduced in inlay, painting, or even carving. Of the five, the two upper subjects are most suitable for enamel. The first is a conventional rendering of the now extinct dodo, and if a title were wanted for this sketch it might truly be called "An Early Bird." In like manner, the subjects with the orols might be named "Birds of a Feather." The central cross is founded on a Celtic model, but is not carried out rigidly in that style. It might be executed in any of the ways above mentioned, but is perhaps best adapted for carving. The two designs at the foot of the page are for enamelled iron, but with modification they could be done in a variety of ways.

SCHOOLS OF ART.

On Thursday week the President of the Science and Art School at Torquay gave an open air entertainment to the subscribers and pupils of the science school, in his grounds at Woodfield. Addresses were delivered by Mr. Sheppard, Mr. Strong, and Mr. Buckmaster. From the statement of the latter speaker it appears that more than 100 pupils have passed through the science classes in three years, and that one pupil walked nearly 500 miles to attend a class in animal physiology. He obtained a medal from the Science and Art Department at the last May examination. The success of the classes is mainly due to the earnestness of the teacher, who is also the master of the British school and the co-operation of a very active committee. The classes are held in the evening, during the winter months, at the Science and Art School, and are chiefly attended by young men who are engaged in the day time. After the usual votes of thanks the meeting separated.

A meeting of school teachers and others was held at the Bath Forum School, Bath, on Saturday, for the purpose of considering the scheme of the Science and Art Department. Mr. Buckmaster delivered an explanatory address, which was followed by a discussion of some interest on the recent Science and Art Scholarships of £5 and £10 each for boys in elementary schools.

THE THAMES EMBANKMENT.—ARCH AT TEMPLE STAIRS.

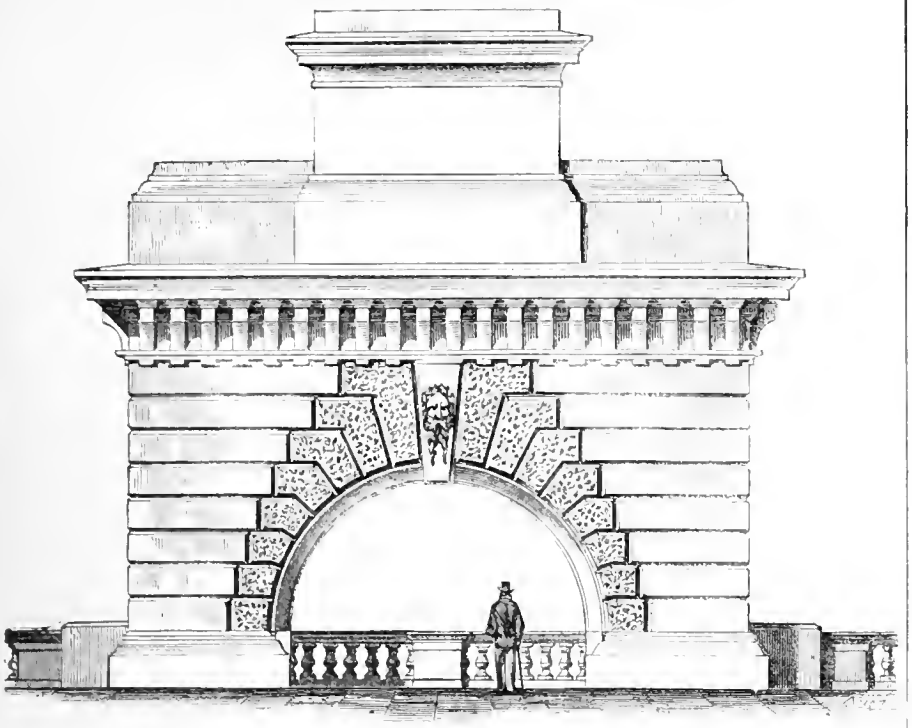

FIG. 1

THE THAMES EMBANKMENT.

THIS great engineering work was partially opened to the public on Thursday, August the 7th. Leisurely conceived, swiftly, but not hurriedly executed, its progress marred by no delay and saddened by no accident, it is, as far as engineering can make it, a work of which the metropolis may be proud. With its merits, as the work of an engineer, praise must perforce cease, and of its lamentable deficiencies in all that is architectural, fit, becoming, elegant, or even coldly correct, all architects and not a few engineers must be painfully aware. It is seldom in a generation or even a century that a work of this importance is executed. We might expect to find that excessive care has been taken

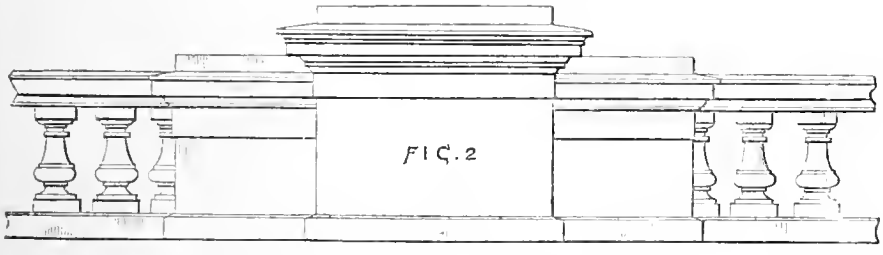

FIG. 2

in the selection of the engineer, and especially in the selection of the Board. The constitution of the latter has long been a scandal to the metropolis and a disgrace to the nation. Burghers and vestrymen, however honest, are not the men who should control great metropolitan improvements. In such a board, entrusted as it is with almost unlimited powers, we have a clear right to expect the highest professional talent, unimpeachable fidelity to public duty, and the soundest judgment, not without a touch of state-craft though unwarped by political bias. Its members should be men of more than average intelligence, and on some patent grounds worthy of the post they fill. Their proceedings should be thoroughly open, and their appointments and accounts alike able to bear scrutiny. Had this been the case we should not be called upon to condemn utterly in the Thames Embankment everything above high water mark and not a little that is below it. Of the latter we may cite the sharp angles of the projections, so liable to injury, and the carved keystone at Whitehall Stairs, which is actually submerged for some hours every tide and seems to court destruction.

That portion of the embankment which is in the most finished state and whose ugliness may therefore be most readily perceived is undoubtedly the arch at the Temple Stairs. The cut, fig. 1, does not give an unfair idea of this extraordinary production of the hand—we will not say the mind, of man. The reader will observe its just proportions, graceful outline, and delicate mouldings. Besides, the thing itself is to be seen. Those who run to catch the boat to Westminster or London Bridge may see and mark, they cannot learn much, and can digest less, but they can plainly see that they are approaching an extremely ill-proportioned structure, the like of which will not be found elsewhere on this earth, and they will on inquiry be informed that it emanated from Mr. Bazalgette and the Board of Works. If they are strangers they will wonder who is the former, and what manner of men are the latter. If they ask is Mr. Bazalgette an architect of eminence that he should be entrusted with the architectural decoration of this great work, what answer will they get? Do they seek to know something of the responsible Board, what will they learn? If they put these questions to an architect, or even an amateur of judgment, they will get an expression of pity for the one and contempt for the other. In Mr. Bazalgette's place most engineers would have done as he has done. Totally ignorant of architecture, and therefore undeterred by considerations which would fetter the merest tyro in the art, he has caused to be executed in the best and most durable material the very worst architecture to be seen in any public work of this or any other age. It is not too much to say that, as far as architectural design goes, of things purely architectural, such as balustrade with piers, handrail, parapet, ornamental arches, and the like, there is not a redeeming feature in this vast work. The material, granite of the best quality, has been misunderstood and misapplied. The parts, instead of being massive, almost without break, continuous and broad, and rounded at the angles below high water-mark like a dock, are small, broken up, treated like Bath stone and alike liable to inflict injury within and receive it from without. Fig. 2 shows the treatment of the centre of one of the bastions on each side of the arch, fig. 1, flanking the pontoon. Besides the unpardonable fault of having a pier in the centre of a bay or space, as in fig. 1, the manner in which the central portion is raised is clumsy beyond measure. Fig. 3 exhibits a section of the rail and a baluster to scale of ½in. to the foot. The outside, it will be perceived, varies from the inside, and is infinitely uglier. A cornice composed of a cymatium and two or three other members without a corona, is not architecture at all, still less is it design. The projection of the cymatium renders it singularly liable to injury from a drifting barge or even a grappling boathook. On the inside the

FIG. 3

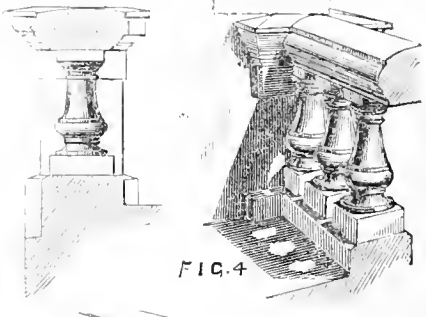

FIG. 4

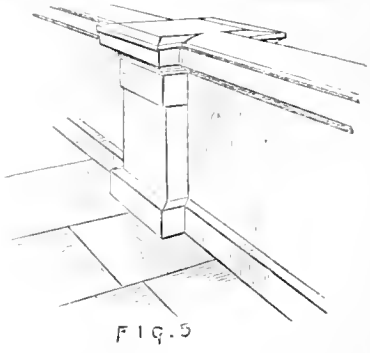

FIG. 5

projection is less, but it is full 5in. and forms a sharp and dangerous corner. The plinth likewise, which is as ill-proportioned as possible, being only 5½in. high, has 5in. projection into the footpath. Common sense, dealing with granite, would have made the balusters square, as they are to be seen in the terrace at Trafalgar-square; and common sense would have made the inside face of the parapet either perfectly plain without breaks, or with such slight ones as are in the same terrace. Common sense would have avoided excessive projections and undue delicacy of mouldings. The external portion of the rail, which is worked into a very bad species of *quasi* Gothic moulding, is ruinous to the effect as seen from the river. Had the rail been rounded on the inside there would have been reason for it, as being more comfortable to lean against, less liable to wanton injury, and incapable of hurting an incautious passenger. Of the baluster little need be said, it speaks for itself. The topmost member is 10in. square, and the lowermost 12in. This is quite sufficient to show the qualifications of the inventor. Fig. 4 is the balustrade within the arch, fig. 1. It is a fair represen-

tation. It will be seen that there is no half or quarter pier against the arch, and that the centre pier stands alone and unassisted in the centre. Its gratuitousness is forced on the beholder by every device. Comment on such rubbish is criticism thrown away. Fig. 5 represents one of the ordinary intermediate piers. It is 3ft. wide in the narrowest part. The plinth has a projection of 2¾in., with a height of 5½in. The effect may be imagined. The cornice, apart from its excessive projection, is as good as need be, plain and bold; the handrail is far from being bad. If both had been continued inside and out we should have been contented. At the Westminster end, where there is no imitation, or rather caricature, of Classic forms, the mouldings and general effect are better, but the jointing of the stone in the stairs from the bridge and the way in which the handrails run into the piers at top and bottom of the steps is the work of a carpenter accustomed to *mitre* his material. Treatises have been written on this very subject of jointing stone, the golden rule being never to cut a joint to less than a right angle. A comic artist who understood architecture as an art, not a trade, might amuse himself and others by spending an hour near Westminster Bridge, yet we doubt if he would amuse the reflective portion of the community. Illustrations of a great national work, which to those who have not seen it would certainly pass for caricatures, would not be productive of mirth to such as wish well to the cause of art and hoped we were in the midst of the much talked of revival. There are architects in London who would not have grudged to give Mr. Bazalgette, or the Metropolitan Board of Works perhaps, an hour or two of time and half a dozen words of advice, and even, if need be, a few rough sketches, to prevent the Thames Embankment from being irretrievably disfigured and the architectural profession irretrievably discouraged. It is no very difficult thing to measure the overflow of a drowned dam or estimate the outfall of a sewer, but architects rarely undertake these duties. There appears, however, to be no branch of architecture at which engineers fear to try their hands, and none in which they do not fail signally.

THE NEW LAW ON COMPENSATIONS.

In the new Regulation of Railways Act an alteration has been made as to the law of compensation for lands purchased or injuriously affected by railways, and which amendment, if adopted, will materially change the practice in "compensation cases." By the 41st section (31 and 32 Vic., cap. 119), it is declared that whenever, in the case of any lands, purchased or taken otherwise than by agreement, for the purpose of any public railway, any question of compensation in respect thereof, or any question of compensation in respect of lands injuriously affected by the execution of the works on any public railway, is, under the provisions of the Lands' Clauses Consolidation Act of 1845, to be settled by the verdict of a jury impanelled and summoned as in that act mentioned; the company or the party entitled to the compensation may at any time, before the issuing by the company to the sheriff, as by that act directed, apply to a judge of any one of the superior courts of common law at Westminster, who shall, if he think fit, make an order for trial of the question in one of the superior courts, upon such terms and in such manner as to him seem fit, and the question between the parties to be stated in the issue to be settled, in case of difference, by the judge or as he directs, and such issue may be entered for trial and tried accordingly in the same manner as an issue joined in an ordinary action, at such place as the judge directs, and the proceedings to be under the control of the court, as an ordinary action. Furthermore, it is provided that whenever a company is called upon or liable, under the act mentioned, to issue their warrant to the sheriff in the case of any disputed compensation, and the company obtains a judge's order, the obtaining of the same and notice thereof to the opposite party is to be a satisfaction of the company's duty in respect of the issue of the warrant. The verdict of the jury and the judgment of the court upon the issue, as regards costs, &c., to be entitled to the same effect as if the verdict had been obtained before the sheriff on a warrant issued by the company under the recited act. The provisions as to compensation cases have immediate operation.

THE SEWAGE OF GLASGOW.

The report by Messrs. Bateman and Bazalgette on the disposal of the sewage of Glasgow has been printed. The scheme which they recommend is the construction of a series of intercepting sewers emptying into a main conduit running to the Ayrshire coast, and the employment of the sewage for purposes of irrigation. They propose, where practicable, availing themselves of gravitation, and when that is impossible resorting to pumping. The time they estimate as necessary for the completion of the works is six years, and the gross cost, including preliminary and Parliamentary expenses, and the accumulation of interest during the construction of the works, they set down as £1,253,256; the annual charges they state at £3,550 for pumping, and £1,320 for the maintenance of the main conduit, &c. Besides this, the interest on the works at 4 per cent. will amount to £50,000, so that the annual charges, including interest, will be equal to a rate of 5½d. in the pound on the present rental, or 4½d. in the pound on the probable assessable value of property in the city by the time of the completion of the works. On the other hand, they estimate that at the very lowest the sewage ought to be worth £58,524 per annum for irrigational purposes, and are of opinion that, though this sum will scarcely be realised for it for some years, until agriculturists have learned the value of the fertiliser placed at their command, yet, "if a sufficient area of said land adjoining the coast be secured by the promoters, and the sewage applied for irrigation, a very considerable margin of profit will be left after paying interest on money invested in the farm and all working expenses."

Building Intelligence.

CHURCHES AND CHAPELS.

All Saints' Church, Falsgrave, Yorkshire, will shortly be consecrated. The edifice comprises nave, aisle, and chancel, and a tower and spire are to be added to the north-west front, and a chancel, aisle, and vestry at the south-east angle. When completed, the church will accommodate between 900 and 1,000 persons. The cost will be about £5,400. Mr. G. F. Bodley is the architect, and Mr. Barry, of Scarborough, the builder.

On Wednesday week a new Congregational Church at West Cliff was opened. The style is Early Geometric Gothic, and the cost is £4,000. Seats are provided for 950 persons. A tower and spire rise to a height of 120ft. Mr J. P. Pritchett, of Darlington, is the architect; Mr. Dongill, the clerk of works; and Mr. R. Robinson, of Whitby, the builder.

St. Andrew's Church, Montpellier, near Bristol, after having been closed for some time for the purpose of undergoing renovation, was reopened on Sunday last. In the interval a large sum has been expended in improving the interior of the edifice. The walls have been painted, and in prominent places a number of scriptural texts have been placed. The panels of the reredos are illuminated alternately with the Greek cross and the fleur-de-lis, the three centre panels being reserved for especial adornment. In the centre one is a large Greek cross, and on either side scriptural sentences, in brilliantly illuminated characters.

St. Andrew's Episcopal Chapel, Perth, was opened on Sunday. The chapel, which is in the Early English style of architecture, is of an oblong form, with the roof supported by open rafters, and contains sittings for about 400 persons. The interior of the chapel is plain.

The foundation stone of a place of worship has been laid in Dewsbury for the use of a body of revivalists who have no other name than the Dewsbury Glory Band.

The parish church of Oundle took fire early on Sunday morning, apparently spontaneously; and the fire was not got under until four of the bells in its fine peal were cracked.

On Saturday, the 15th instant, the new church of St Katherine, Stuttgardt, was consecrated by the Bishop of Honolulu, who has been the last week preaching for his mission at several places in Germany, and holding confirmations under a commission from the Bishop of London. The building itself is in Decorated Gothic, cruciform, with a spire rich in gilt ornamentation; it is 90 ft. in length from the west end to the vertex of the apse which forms the eastern end of the chancel. In the southern transept is placed the organ, while the northern one is used as a small chapel for daily service, and furnished accordingly. The reredos consists of three Gothic arches, each enclosing in sculpture a sacred subject—the northern one the Birth, the southern one the Baptism, and the central the Crucifixion. The floor of the chancel is paved with encaustic tiles, tastefully arranged, and the whole of its windows are stained glass.

Church building and restoration are progressing well in Worcestershire. At Hallow, two miles and a half from the city, a new church is being built, and may perhaps be ready for consecration by Christmas. The style is Decorated; the roof is steep-pitched, and stone-arched ribbed, and a handsome reredos is promised by Earl Beauchamp, the lay rector of the parish. There will be 450 sittings. About £4,000 has been raised for the new church which is being built near the railway station at Droitwich, but more money is wanted before the building can be consecrated. It is in the Decorated style and has about 300 free sittings. The Baroness Windsor generously defrays the cost of a chapel of ease at Webheath, in the parish of Tardebigge, near Bromsgrove. The chapel is in the Early English style, will have 200 free sittings, and consists of nave, chancel, vestry, and bell turret. September will see the opening of the new parish church at Churchill, near Kidderminster, erected by Mr. Hopkins, in place of the dilapidated old building of thirteenth century architecture. A district church is in course of erection at Blackheath, near Rowley, for the contiguous parts of Rowley, Hales Owen, and the Quinton. The style is Early English; there will be 847 free sittings; and the total cost of the building (which is to be endowed by the Ecclesiastical Commissioners) will be more than £6,000. Mr. Wilson, of Birmingham, is the builder. At Castle Morton, a chapelry to Longdon, near Tewksbury, a chapel of ease, in the Early English style, is to be begun next spring. It will be a plain parallelogram, with bell-cot at the west end and south-west porch, and 90 sittings. It is to cost £500; the present deficiency is only £150. Iccomb church (in a parish on the eastern borders of Worcestershire, now transferred to the diocese of Gloucester) is to be restored by Mr. Worcester. St. Andrew's Church, Worcester, is to be restored at a cost of £2,000. The cathedral restoration proceeds but slowly.

BUILDINGS.

New Roman Catholic schools are being erected at Wadhams Hill, Wolverhampton, from designs by Mr. E. Welby Pugin. The material used in the exterior is brick, with stone facings and string-courses. Mr. Heveningham is the builder. The cost is estimated at £1,215.

A new dock was opened at Boulogne, on Tuesday week. The dock was commenced in 1859. The basin for shipping is 17 acres in extent, with a quay wall frontage of 3,600ft. and a quay space of over 240,000 square feet. The cost has been £300,000.

The rector of West Toft (Rev. Mr. Sutton) has met the recent scarcity of water by digging a well in the village, and presenting it to his parishioners. Over the well a pretty pump-house is being built. It will be 20ft. high, and is to be surmounted by a cross. Three large Gothic windows will be the chief features of the structure, which is to be flint, with stone and white brick dressings.

New premises for the National Provincial Bank of England have just been completed at Southampton. The materials used are Corsham Down and Portland stone. Mr. J. Gibson, F.R.I.B.A., of Westminster, is the architect, and Messrs. Bull and Co., of Southampton, the contractors.

At Hurstpierpoint, Sussex, on the 14th inst., the foundation stone of new parish schools was laid by the Lord Bishop of the diocese. The schools comprise boys' and girls' school, class rooms, and infant school, with master's house attached. The contract price is £1,867. Mr. F. Hollands, of Hurstpierpoint, is the builder, and Messrs. Goulty and Gibbins, of London and Brighton, the architects.

Extensive and long-wanted alterations are shortly to be made in the Southwark Police-court, Blackman-street, Borough. The cells will be reconstructed the interior of the court altered considerably, and a new and commodious police station erected.

A new theatre will be opened at Croydon to-morrow (Saturday) evening. The plan is similar to that of the Holborn Amphitheatre, the stage being so arranged that it can be used for either operatic, dramatic, or hippodramatic entertainment.

TO CORRESPONDENTS.

Notice.—Cases for binding the BUILDING NEWS, Vol. XIV., are now ready, price 2s. each.

To Our Readers.—We shall feel obliged to any of our readers who will favour us with brief notes of works contemplated or in progress in the provinces.

Letters relating to advertisements and the ordinary business of the Paper should be addressed to the EDITOR, 31, TAVISTOCK STREET, COVENT GARDEN, W.C.

Advertisements for the current week must reach the office before 5 o'clock p.m. on Thursday.

Received.—C. B. A.—W. S.—I. N.—I. M.—R. P. S.—A Student.—M. and T.—W. Brothers.—W. H. C.—R. and G.—A. and C.—B.—T. Dewsou.

Maxwell and Tuke, Bury.—Your letter and plans for workmen's cottages, will appear in a future number of the Building News.

Correspondence.

NATIONAL COMPETITION—SOUTH KENSINGTON.

To the Editor of the Building News.

Sir,—You have devoted considerable space to the description of the architectural designs submitted in competition for the Queen's medal, and now being exhibited at South Kensington; and I therefore think you will not be unwilling to publish a suggestion from one of the students who furnished a design. Would it not be much better and more satisfactory to competitors generally if the adjudicators were architects by profession, instead of being artists only who know little or nothing about architecture? As regards myself I have made up my mind never again to waste time in this competition, without some alteration is made in the persons selected as judges. My reasons for doing so are as follows:—I am an architect of good experience, and have gained some competitions, and for the South Kensington competition I prepared what I still believe to be a good design, and I am supported in this opinion by several other architects. In the same school of art in which I am a student, another design was prepared by a youth who has no knowledge of architecture, and his design was in every sense impracticable. Wooden gables were shown without any means of support; arches were numerous which had no means of abutment; and disproportion and eccentricity were the most noticeable characteristics of the design. However, to make it go down, I suppose, with the sagacious artists who were the judges, the design was filled in with all sorts of fiddle-de-de woodwork, as small as the chasing on the back of a watch, and generally speaking as impracticable as useless; and, to cap all, the angle of the building was shown supported on a light wooden roof. This latter design was honoured with a medal. My own has been returned without even receiving the honour of being exhibited at South Kensington. It will be obvious to all that, as an architect, I felt bound to be governed by the necessities of good construction, architectural appropriateness, convenience of arrangement, &c., and I could not (even if I would) have indulged in the unarchitectural nonsense with which my fellow competitor's design was filled. I would add that I am not urged by any ill-feeling in thus writing, but by a desire that these competitions should be conducted in such a way as shall ensure the best design receiving the greatest honours, which I am convinced will never be the case whilst artists with little or no architectural knowledge occupy the position of judges.—I am, &c.,

A Competitor.

BUILDING SOCIETIES.

Sir,—"Why pay rent?" "Why not pay a *little* more for a *few* years and the house becomes your own property?" We have all heard these questions pretty frequently, and an article on the subject in a recent number of the Building News induces me to ask for space for a few remarks.

Building societies, as a rule, profess to lend money at 5 per cent., and they do, in reality, nothing of the kind. I have had occasion to use them for and at the request of clients, and I know their methods pretty well.—You want (say) £1,000 for ten years—very well, 5 per cent. on £1,000 is £50, which multiplied by 10 is £500 interest, and this added to the principal, £1,000, is equal to £1,500. Now the societies are so kind as to allow you to pay off this £1,500 by annual instalments of £150. But £150 per annum for ten years is worth at the end of that period £1,886, and over. Hence you really pay 8½ per cent. instead of 5, or, assuming that the business of the society is large, and that these instalments are reinvested in the same manner, the rate of interest becomes usurious. I have now before me the prospectus of a company which has powers of borrowing from Government the amount of the subscribed capital at 4 per cent. interest; yet they adopt the same scale of repayment charges as the rest of the fraternity. They *could*, with the aid of entrance fees, fines, charges of 1s. for a two penny pass-book, &c., afford to lend at 5 per cent. as they propose. How is it they do not? The reason is plain—the last dividend was declared at the rate of 7½ per cent. Small chance, I think, of borrowing at 5 per cent. under these circumstances.

The public ought to be able to borrow on the security of houses and lands two-thirds of their market value for stated terms of years not exceeding (say) twelve, at 5 per cent. interest on the annual balances of the principal; and it is, I think, a fair question whether the Government could not safely and profitably employ the deposits in the Post Office Savings Banks to this very desirable end. Thousands would be benefited by the adoption of the system, and as the lending public are now content with 3½ for their deposits, there would be no risk in satisfying the borrowing public, who are willing to give good security and 5 per cent.

As matters at present stand it is really wiser to continue to pay rent to a landlord instead of half as much again for ten or twelve years to a society, for if you invest the annual difference it will accumulate to a sum sufficient to buy your house two or three years sooner than you could have done by the "aid" of the society.—I am, &c.,

E. Ingress Bell.

WALWORTH COMMON COMPETITION.

Sir,—As one of the unsuccessful competitors, and finding the guardians look with indifference at the reasonable request of the majority of competitors, I would beg your kind permission to put a few questions, to which I may possibly get a reply.

I am not going to enter upon the merits or demerits of either of the premiated plans (for here, I think, ample has already been said), but simply to join issue in condemnation of the choice made by the guardians (entirely stultifying their own printed instructions); and here let me inquire if it is correct that a large number of plans were thrown out, the competitors not complying with the instructions; also, whether the three best plans of the remaining portion, according to the guardians' opinion and judgment, and complying with their instructions, were made choice of, and in juxtaposition with other plans not in accordance to those instructions, but yet made choice of by the guardians. I am at a loss to know how a majority of the guardians should set aside and ignore their own instructions, and perform such an act of unfairness to those competitors who had so justly succeeded, had the guardians acted up to the spirit of their instructions. In confiding to their honour, the majority of the competitors had placed implicit confidence for an impartial decision, and spent nearly two months of their time. Would not the proper course have been, when so divided, to have considered the request of the competitors, and called to their aid a gentleman of standing in the profession, or have awarded the premiums to those who had complied with their instructions, and have refused others for noncompliance?

Trusting the guardians may yet see a way to do justice, or state the reason of adopting such a course.—I am, &c.,

Thos. Jewell,
Author of No. 9 plan.

WALTON AND WEST DERBY SEWERAGE—LIVERPOOL.

Sir,—Your notice of our examination of Mr. Rawlinson's report on the sewerage of Walton has called forth a letter, in which he says, "I am not going to argue the whole case over in public, but simply to state a few facts." Most of these facts—fictions, we think, would have been a more appropriate term—he neglects to mention, have already been placed by him before the Liverpool public. His statements we have shown to be quite fallacious, and it is clear to us that he has written a report which, among other shortcomings, displays, to take the most charitable view, great carelessness in dealing with the subject, combined with most serious topographical inaccuracies. Mr. Rawlinson may not believe this, but the weakness of his case is evident from the fact that he has not fairly met any one of the statements we have challenged him to disprove, except by reiterated assertions, which only confirm us in our suspicion that the views expressed by him were taken up hastily under influences not favourable to the delivery of an impartial verdict.

This is our view of the case, but we shall not ask your readers to believe it until we deal with the facts themselves, and then they can form their own opinion. We would gladly have confined our remarks solely to the engineering merits of the two schemes, but, as Mr. Rawlinson in one letter accuses us of "self interest dulling our perceptions," and imputes other motives in equally choice phrases, we cannot help this allusion to the whole transaction as it appears not only to us but to the members of the Walton Board.

We shall not attempt to vindicate our right to subject his report to legitimate criticism. Such would be absurd; though we can quite understand that one who has had all his own way for so long a time, as Mr. Rawlinson has, should, from his own point of view, consider any questioning of his infallibility extreme presumption—though how it can be construed into treating him with more than disrespect we know not. If Mr. Rawlinson had not written a letter to the *Liverpool Mercury*, in which, though it recoiled upon himself, the intention of crushing us once for all with abuse and sneers was not transparently evident, he would have had a better claim to consideration, though we cannot help, at the same time, congratulating him on the improved tone and temper of his later letters. We have no wish to trespass further on your space with mere personal matters, so are quite willing to let the subject drop.

Let us examine the first of his facts; indeed, it contains the theory upon which he bases his recommendation to waste sewage:—In his report he says, "A few places situate on large tidal rivers, such as the Mersey, or on the sea, where there is a deep water shore, may harmlessly waste sewage by draining direct to such waters."

This at once suggests the question whether the wasting of sewage by the Rimrose outlet will be of a harmless nature, and for an answer we have only to read a little further on that, "Bootle, Waterloo, Seaforth, Southport, and other places dependent on summer visitors, and situate on a flat shore left dry at low water, which shore is used for bathing, must consider their own specialities and prevent shore pollution."

The majority of your readers will perhaps be as ignorant of the situation of those places as Mr. Rawlinson evidently was of the outlet he recommended. Will it be believed that this very outlet will discharge at the boundary line dividing two of those places, viz., Bootle and Seaforth? He gives us the poison and suggests the antidote. The Waterloo and Seaforth Board have decided to act on his advice; they dislike "Cloaca Maximas" discharging on their shore, and have instructed their law clerk to oppose its construction. Under these circumstances, perhaps, it may be in the nature of a crime to waste sewage.

As Mr. Rawlinson has admitted in a letter to the *Liverpool Daily Post* that "if there had been no safe means for constructing a permanent relief outlet for surplus sewage when not wanted, I should have recommended tanks, engines, and irrigation, as designed by Messrs. Reade and Goodison," it will be unnecessary to support our plans as a scheme for sewage utilisation, and we may confine ourselves to the question of cost, to which the controversy is now narrowed. In his letter he says "I have recommended the Rimrose Bridge outlet as cheapest in first cost." Let us see how this agrees with his original report, where it is stated:—"This sewer may be comparatively costly to construct in the first instance, but it will give a permanent outlet for sewage," and also it will, "like the Cloaca Maxima at Rome, endure. Costly, comparatively, to what? There is but one answer, for of the four sea outlets brought under his notice by the chairman of the West Derby Board, we have Mr. Rawlinson's authority for saying it is the cheapest; therefore, as our outlet is the only other left for comparison, can he seriously say "that he recommended the Rimrose outlet as cheapest in first cost?"

This is a very fair specimen of the forgetfulness of former language which appears so characteristic of him. If Mr. Rawlinson will only do us the favour to read our report, which we have before frequently recommended him to do, he will there find that, as estimated by the chairman of the West Derby Board, whom Mr. Rawlinson is quite right in describing as an eminent contractor, the combined sea outlet will cost £35,000, while our outlet, tanks, engines, and laying out 150 acres as a sewage farm, will cost but £16,120 11s. 6d., thus showing a saving of £18,579 8s. 6d. in first cost in favour of utilisation. We have before challenged Mr. Rawlinson to prove our estimates fallacious; we repeat the challenge, and if he requires it will go to the expense of getting a competent surveyor to check the estimates. In the face of these facts, his assertion is injudicious, not to say foolish.

In describing our plans his letter says: "Part of the area of Walton is to be sewered by pumping, and the entire sewage is to be dealt with partly in depositing tanks and partly in irrigation." Though we have his authority for saying that our plans would have been recommended by him had not the tidal River Mersey been so convenient, and its populous shores so close at hand, we are afraid that the above quotation shows such a confusion of mind as to what our plans really are that he would have recommended them from a false conception of their nature. None of the area of Walton is to be sewered by pumping, and all the sewage, except during storms, when it will partly flow into the River Alt, at a time when no damage can be done, will be dealt with by irrigation. Walton, we may inform him, does not, as Butler describes Holland, "draw 50ft. of water," and its drainage will flow by our route down the natural valley line without the aid of pumping. The pumps are merely for lifting the sewage on to the land for utilisation purposes.

Regarding the choice of land the letter says: "Liverpool is growing at so rapid a rate that no man can predict how far the suburbs may extend, or the prices land may rise to

for villa purposes, and sewage farming beyond a township boundary will not in most cases be desirable." True, no man can predict what may take place, nor can he predict of any place in England that a town may not spring up in the middle of what is now a rural district, but are we to be debarred from carrying out sanitary works on that account? If so, the whole of the transactions of this changeable world ought to be stopped until we are assured that all is permanent. Let him, however, make his mind easy on this score. We have known Liverpool for six and thirty years, and we can assure him that villa building at Kirkby, in the neighbourhood of the proposed pumping station, is, in the language of brother Sam, "a contingency not at present on the cards," and below the pumping station and between it and the sea there are thousands of acres of suitable agricultural land available. Perhaps he will inform us more clearly why "sewage farming beyond a township boundary will not in most cases be desirable." A little light thrown upon that point would be valuable.

If we show a little levity we must be excused; we find it difficult to look at such statements seriously. Perhaps, after all, he is only joking.

Mr. Rawlinson is very fond of the interrogative form of composition. Taking his cue, we ask him, as a business man, who was to treat for a sewage farm before either board had decided upon adopting utilisation? In former times Mr. Rawlinson had pronounced strongly in favour of utilisation as a principle, now he puts it on more mercenary grounds. He says: "The value of a thing is just whatever it will bring," and solemnly, "if it saves money to waste sewage, then, according to the laws of political economy, wasted it must be."

It appears to us most incomprehensible that any man of knowledge should recommend the wasting of sewage on to the shores of a thickly populated neighbourhood, and yet be so tender about the slightest overflow under any circumstances into the River Alt, along whose course, from the proposed outlet to the sea, there is scarcely a single habitation, whose waters are not used for drinking purposes, and are at present dreadfully polluted with sewage; yet below Walton no complaints are heard of. It has been proved over and over again that if the dry weather flow of sewage is provided for, the stream may safely be left to take care of itself. No injunctions need be apprehended under such circumstances, and still less if the dry weather flow, diluted with twice its volume of water, is provided for by pumping on to lower land, as in our scheme.

In another part of his letter he informs us, "Messrs. Reade and Goodison have so read up this sewage utilisation question (and it has simply been reading) that they will take no other view." It is not pleasant to deal so in repetition, but if Mr. Rawlinson will only read our report he will find that the information has been gained principally by inspection of some of the principal sewage works and inquiry on the spot, and our knowledge of main sewers has not been gained in a back parlour, but by the carrying out of actual works. In addition, we have had the advice of practical authorities on sewage farming,—agricultural advice which Mr. Rawlinson expressly states in his evidence before the Commission on the Sewage of the Metropolis he is incapable of giving.

There are many other minor statements contained in his letter which cannot boast of greater accuracy than attaches to these already mentioned, but we need not notice them. A great point is, however, made of there having been three engineers to the West Derby scheme, viz., the local surveyor, the chairman of the West Derby Board, and the late Mr. William Stubbs—"Nil nisi bonum de mortuis." None have a greater regard for his memory than ourselves, but, as a matter of fact, having at his death purchased all his plans and added his business to our own, we have made diligent search for the evidences of his having made "main sewerage a study;" we can find no plans or documents bearing on the subject, so that if he did make it a study it was done at home. One of us was his fellow pupil; he was a versatile genius, and we have the highest admiration of his talents, but the evidence of the study of main sewerage is wanting.

If the chairman of the local board was so intimately connected with the engineering of the sea outlet no wonder he clings so to his own scheme, and, perhaps, Mr. Rawlinson's faith in him may have had some influence on Mr. Rawlinson's mind. Mark, we do not say it had (perhaps it had), but is it kind to bring up a man, as poor Stubbs is brought up, as witness on his own behalf that the scheme he prepared four years ago is cheaper than one the plans of which were not made until two years after his death?

There may be a difference of opinion with regard to the advisability of having a railway contractor who also dabbles in engineering as chairman of a board; we express no opinion ourselves, but have heard others say that it is likely to lead to many evils, for we all know how men on a local board, or elsewhere, especially if they possess energy and determination, with a smattering of special knowlege, are the great stumbling blocks to professional men, such as Mr. Rawlinson, carrying out an enlightened policy; they are surrounded with a dense armour which none can penetrate. We are sure all professional readers will appreciate that fact, "Ne sutor ultra crepidam." Let not Mr. Rawlinson grow indignant over these remarks; we merely state well known truths, of course knowing that there are always exceptions to them, and let us hope his friend is one.

We have now done until Mr. Rawlinson reappears in some other paper (he has been in three already), and we leave your readers to judge whether we have been justified in calling Mr. Rawlinson's report in question. Anyone who wants further information on the subject may have a printed copy of his report on application to us. We wish to do Mr. Rawlinson justice, both in text and context, for beforetimes he has complained that we have confined ourselves to the text. Let us assure him, however, that we are not at all disappointed at his report. We have been in business long enough to be prepared for such contingencies.

But one more correction requires to be made. It was the Walton Board that submitted our plans to him for very excellent reasons, which we quite approve of; firstly, because they, as most boards do under similar circumstances, required another professional opinion, and Mr. Rawlinson appeared to be one of the foremost men to whom they could apply, and, secondly, knowing his intimate relationship with the West Derby Board, they were aware that under any circumstances their plans would come before him. They thought they might as well come before him first as last, for without his approval there was little chance of an amicable arrangement being made with the West Derby Board. We are extremely sorry to make these remarks, but, unfortunately, the Walton Board does not, any more than ourselves, feel confidence in his opinion, and we may be pardoned if we think for this he has, through his erratic conduct, principally himself to blame.

We apologise for so trespassing on your space, but assertions made in a line may take a column to refute them, and, in order to give you an opportunity of judging who it is that deals in abuse, we enclose copies of the former correspondence, which you are at liberty to make any use of you may think proper.—We are, &c.,

READE AND GOODISON.

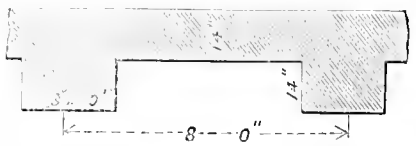
August 18.

Intercommunication.

QUESTIONS.

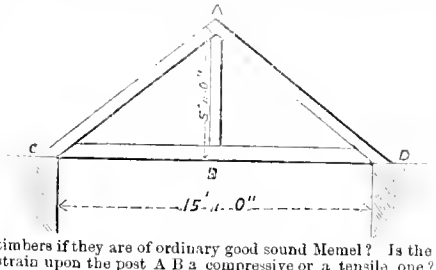
[985.]—PUDDLING ARCHES.—Could any of your numerous correspondents tell me the reason of the puddle lining laid on arches getting cracked and becoming quite full of fissures? What is the remedy for it, as in this state it lets the water through very readily?—T. P.

[986.]—WALL BUILDING.—I have a contract for building 400ft. of wall up a steep incline of about 1 in 10. The wall is to be in plan as shown in the figure. What is the cheapest way to build it so as to have a constant height above ground, and the least amount of material? Would



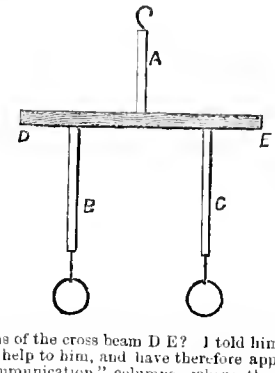
it not be the best plan to bind it in the line of the slope, and have the top nearly parallel with surface of the ground? or would it be better to build it with steps? I should like to get an elevation from some of your correspondents before starting the job.—CONTRACTOR.

[987.]—TRUSS.—In the truss shown in the annexed cut, what is the strain upon each of the timbers supposing the total weight distributed over each of the rafters A C, A D, to be one ton? and what ought to be the scantlings of the



timbers if they are of ordinary good sound Memel? Is the strain upon the post A B a compressive or a tensile one? as I cannot come to a satisfactory decision myself about it.—A BEGINNER.

[988.]—GYMNASTIC ARRANGEMENT.—A friend of mine is putting up a gymnastic arrangement of the description shown in the drawing. The cross beam D E is of wood, and the rods of iron. He wishes to know what ought to be the diameter of the rods A, B, and C; and the



dimensions of the cross beam D E? I told him I could not be of any help to him, and have therefore applied to your "Intercommunication" columns, where these questions are generally discussed and practically answered.—A COUNTRY SUBSCRIBER.

[989.]—MAGNETISM.—Allow me to ask, through the medium of "Intercommunication," which is the best way of imparting temporary magnetism to soft iron without having recourse to electricity? As I have no electrical machine or galvanic battery I could not avail myself of those means which are sometimes used, I believe.—GALVANISM.

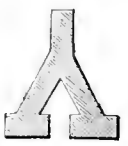
[990.]—PRESERVING TIMBER.—What is the best way of preserving timber from rot in wet situations; and is it possible to buy any ready prepared for such purposes; or must it be sent, by the load or otherwise, to a manufacturer to properly prepare it?—S. T. L.

[991.]—STEAM POWER FOR SAWMILL.—I have a carpenter's shop, which is contiguous to a mill, from which I am about to have power to run a circular saw. Can any of your readers give me any information as to the proper price to be paid for the accommodation? Is there a scale of charges according to size of saw, or any other rule?—SAWDUST.

[992.]—HIGH PITCHED ROOF TRUSS.—Would "Provincial" kindly inform me where I can procure Mr R. Norman Shaw's Book Views, &c.; also the price? And would some correspondent kindly tell me the proper way to brace a high pitched roof truss, say as per sketch?—YORKSHIRE STUDENT.

[993.]—STUDENT'S GUIDE.—In an answer to 466 in your impression of August 16, 1867, an "Apprentice" recommends a book—"Student's Guide for Measuring and Estimating Artificer's Work." I should be very glad to know where it is published, and the cost of it.—G. N., Brixton.

[994.]—LOAD ON CAST-IRON SKEWBACK GIRDERS.—Can any of your readers furnish me with a for-



mula for ascertaining the safe load on cast-iron skewback girders of this section; and what is the most favourable mode of disposing the metal?—URGENT.

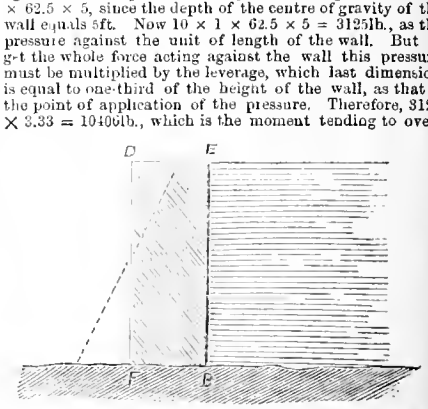
[995.]—THE LONDON ARCHITECTURAL ASSOCIATION.—How is it that the London Architectural Association is idle during the summer months? Meanwhile, I am constantly reading of the doings of provincial associations.—LOOKER ON.

[996.]—COMPLETE SET OF BUILDING NEWS WANTED.—Can any subscriber sell me a complete set of BUILDING NEWS from issue? If so, will they name the price?—B. J. A.

[997.]—IRON IN IRON ORE.—May I trouble you, or any of your readers, to inform me in detail how to ascertain the amount of iron in iron ore?—IRON.

REPLIES.

[961.]—RETAINING WALLS.—As X + Y expressed himself indebted to me for the solution I gave him respecting his problem of finding the centre of gravity of a semi arch, I will endeavour to satisfy him regarding the thickness necessary for retaining walls. The simplest way to proceed will be to assume the wall to be rectangular, find its thickness upon that assumption, and then give it the ordinary batter. In the figure, let D E B F be a rectangular retaining wall 10ft. in height; let the weight of a cubic foot of water be taken equal to 62·5lb; then the pressure against the wall per foot in length will be equal to $10 \times 1 \times 62.5 \times 5$, since the depth of the centre of gravity of the wall equals 5ft. Now $10 \times 1 \times 62.5 \times 5 = 3125$lb., as the pressure against the unit of length of the wall. But to get the whole force acting against the wall this pressure must be multiplied by the leverage, which last dimension is equal to one-third of the height of the wall, as that is the point of application of the pressure. Therefore, $3125 \times 3.33 = 10406$lb., which is the moment tending to over-



turn the wall. To resist this force, a certain weight of wall must be necessary, and since the length and height are known all that is wanted is the thickness. The wall is supposed to turn about the point F, and the leverage with which it will resist the overturning is the distance from this point to the centre of gravity of the wall, equal in this case to half the thickness. Putting W for the weight of a cubic foot of water, W^1 for that of the wall, H for the height, and T for the thickness, we have

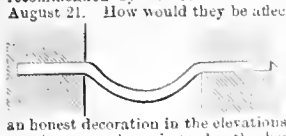
$W^1 \times H \times T \times \frac{T}{2} = W \times H \times \frac{H}{2} \times \frac{H}{3}$, and reducing for T

we obtain $\frac{W^1 \times H \times T^2}{2} = \frac{W \times H^3}{6}$, and solving for T

we finally find $T = \sqrt{\frac{W \times H^2}{3\,W^1}}$. Substituting the values given in the example, and making $W^1 = 112$lb., the average weight of a cube foot of wall, the value of T is 4.33ft., or 4ft. 4in. This may be regarded as a mean thickness, so that if the wall be battered at the usual batter of 1 in 8 or 1 in 10 the thickness at top and bottom will be determined, as shown in the figure, by the strong dotted line. I omit all consideration of such a case when the *back* of the walls batter, as I never heard, saw, or read of such an instance.—Q. E. F.

[973.]—MEASURING GARDEN WALLS.—There does not appear to be any difficulty in arriving at the true contents of the wall described by your correspondent G. S. E. Let him take the footings first, and the neat work afterwards, and reduce the quantities to the standard rod measurement. There would be no extra for simply striking the joints, as it is done while the work is being carried up. In every case the true contents should always be ascertained, and there can be no impartiality to either party. If it is necessary or politic to make any "allowance" to the builder, let it be always done as an extra, and not under the idea that there is more work done than what is really accomplished.—ARBITRATOR.

[978.]—HOLLOW WALLS.—I see that hollow walls are recommended by "J. M. W." in the BUILDING NEWS of August 21. How would they be affected by the Metropolitan Building Act?



Some glazed headers are sold, I believe, for such walls, and are of extra length. Might not these form an honest decoration in the elevations? The common custom in some places is to dip the headers in coal tar. A more usual plan is that of using little wrought iron cramps, about 4in. long, with a slight curvature in the centre, to prevent the transmission of damp from wall to wall. Whatever these may be in execution, they appear miserably inefficient as bonders.—COTTAGE BUILDER.

[978.]—My advice to "W. B. T." would be, as he cannot use iron ties or cramps, to employ stone headers if his walls are more than 9in. in thickness, and he could not use brick bond. Or he might put in some ties of odd chocks of creosoted timber, which would bond the walls very well. As cheapness is his great requisite, he might get one or two old creosoted sleepers and cut them up.—L. P.

[984.]—FISH PONDS.—"Francis R. Capon" is recommended to read Article 3 on the Use of Asphalte in Construction in BUILDING NEWS of June 12 last. Fig. 1 in section would seem to meet his case.—E.

BUILDING AND LAND SOCIETIES.

THE accounts of the Kidderminster Permanent Benefit Building and Investment Society for the year ending July 31 last have just been issued. The present value of shares is stated to be £5,131 12s. 5d., and the profits of the year £490 12s. 4d. The working expenses are very moderate. The value of mortgages is stated at £5,383 14s.; subscriptions, fines, &c., due, £28 3s. 8d.; balance in banker's hands, £713 11s. 2d.

The seventeenth annual meeting of the Wellington, Dawley, Ketley, and Shropshire Building Society was recently held. From the report it appeared that business had largely increased during the past year. The share subscriptions received amount to £1,490 15s.; repayments and mortgage redemption moneys from borrowing members, £2,156 10s. 10d.; deposits with the society, £2,034 1s. 6d.; and the sum of £3,415 2s. 10d. has been advanced to members on approved mortgage securities. The whole receipts during the year have been £7,247 2s. 6d., and, during the seventeen years of the society's operations, £55,478 11s. The report and financial statement were unanimously adopted, and the officers for the ensuing year elected.

Some conferences have recently been held in Bradford of working men and others, to consider the feasibility of enabling cottage occupiers to acquire possession by co-operation of their dwellings, and thus to become their own landlords. At a meeting held on the 29th of July, it was resolved "That it is desirable to provide to workmen of limited means facilities for the acquisition of dwelling-houses, and to accomplish this object by means of a joint-stock association." On Monday evening an adjourned meeting was held in the lecture room of the Working Men's Club, to consider a scheme that had been drawn up by a provisional committee. The gist of the scheme was that a society should be formed, which should buy blocks of eligible cottage property and sell the houses separately to working men on easy terms; requiring not more than 10 per cent. of the purchase money to be paid down at the time of purchase, and the rest to be paid weekly instead of rent during a term of twelve or four years, at the end of which term the house would become the absolute property of the occupant. Mr. Nichols, secretary *pro tem.*, pointed out the disadvantages under which the occupiers of the lower classes of houses laboured as compared with the tenants of better class dwellings, and entered at considerable length into detail as to the working of the proposed society. A discussion ensued, and, finally, a fresh committee of nine persons was appointed to consider the question, examine the rules of societies similar to the one proposed, and report to a future meeting.

The report of the Improved Industrial Dwellings Company (Limited) to be submitted to the shareholders at the meeting on Friday (to day) states:—In addition to the £50,000 in £100 shares already allotted, £43,250 has been subscribed in 1,25 shares, making the total subscribed capital £ 3,250. The rental received during the half year has been about the usual average in the cases of all the properties except at Wapping, where there have been a few more empty tenements than formerly; and at Greenwich, where, owing mainly to the depressing stagnation of almost every branch of industry during the last two years, there has been a very large deficiency in the amount of rental received. With the revival of trade, however, the dwellings are steadily being tenanted, and the directors have undiminished confidence in the ultimate profit to be derived from the investment. The dwellings have been named "Nelson Buildings." The whole of the buildings at the Britannia street estate are now completed and occupied. They have been named "Derby Buildings." The estate at Bethnal Green has been in the company's possession since Lady day. At present the directors propose to confine their operations here to the erection of a comparatively few houses on plans which have been drawn up to meet the requirements of such a neighbourhood, where there is little or no call for lofty structures. Negociations are pending with the Marquis of Westminster for a lease of a valuable site in Ebury street, Pimlico, upon which five blocks of buildings are to be erected. The directors will be glad to be able to congratulate the shareholders upon the placing of some of the company's property in so good a situation at the West end of London. A further sum of about £40,500 will be required to complete the purchases and contracts to which the company is committed at this date. The second advance of £3,000 towards a loan of £6,000 by the Public Works Loan Commissioners has been received by the company, and the payments of principal and interest have been commenced in accordance with the terms of the Act of Parliament. The charges incidental to obtaining the loan, however, have amounted to £135 19s. 5d., and if the costs of raising future loans are to be proportionately high, the value of the process will be seriously impaired. It is hoped, however, that upon loans of larger amount the costs may be comparatively reduced. The directors propose to debit these costs to a suspense account to be gradually worked off by crediting thereto the first profits arising from the investment of the loans. The directors propose that the usual dividend, at the rate of 5 per cent per annum, shall be declared payable out of this sum, which will amount to about £1,824 1s. 5d., and that the balance of £526 10s. 9d be carried forward. The properties belonging to the company at present completed and occupied are as follows:—Cobden buildings, King's Cross road, 20 tenements; Nelson buildings, Bridge street, Greenwich, 40 tenements; Tower buildings, Brewhouse lane, High-street, Wapping, 60 tenements; Stanley-buildings, Old St Pancras-road, King's Cross, 104 tenements; Palmerston-buildings, City Garden row, City road, 72 tenements; Cromwell buildings, Red Cross-street, Southwark, 24 tenements; Derby-buildings, Britannia street and Wicklow street, King's Cross road, 168 tenements total, 488 tenements in occupation. Buildings in course of erection at Willow street, and at the Bethnal Green Estate, to be completed this year, 190 tenements—total, 678 tenements. The Ebury street site will accommodate about 100 more families, so that the total number of tenements built and projected by the company at this date is about 778. These will afford decent comfortable homes to about as many separate families, or to 3,890 persons, reckoning five to each family.

WAGES MOVEMENT.

THE bricklayers' labourers at Leeds, who struck work about three weeks since in resistance to an attempt made by the masters to reduce their wages from 4½d. to 4¼d. per hour, have agreed to accept the services of Mr S. James Wheelhouse, barrister. Mr. Wheelhouse directed that, pending his final decision, the men should resume work on Monday morning last at the rate of 4½d per hour.

The strike in the wrought nail trade of East Worcestershire continues with considerable determination, neither men nor masters showing the slightest disposition to yield. The number of men on strike is scarcely so great as estimated a fortnight since, owing to the fact that in the neighbourhood of Lye Waste several factors have contracts to complete under a penalty within a given time, and in these cases they have been obliged to employ men at the advanced rate. On the completion of these contracts, however, it is understood that the reduced scale will be adopted in these as in other establishments.

The strike in the joiner trade at Dumfries has been satisfactorily got over by a compromise between the masters and men, it having been agreed that the latter should receive an advance of ¼d. per hour from now till March, when a further advance of ¼d. would take place. The strike has only lasted a week.

STATUES, MEMORIALS, ETC.

THE statue of the Duke of Cumberland, in Cavendish-square, which is in a dilapidated condition, is about to be re cast at the cost of the Duke of Portland.

A memorial portrait has been presented by the working men of Durham to Dr. Waddington, the Dean of that town, principally in acknowledgment of his great liberality to the funds of the County Hospital. The artist was Mr. Clement Burlison, of Durham, and the large frame was carved by Mr. Peter Gradon, of the same place.

On Saturday afternoon a meeting was held at Carlisle of the subscribers to the Earl of Carlisle testimonial fund, for the purpose of determining what form the testimonial should take. The following resolution was adopted:—"That a statue be erected to the memory of the late Earl of Carlisle, that Mr. Foley, R.A., be engaged as sculptor, and that the said statue should be erected on the Mont at Brompton." The statue will be either in bronze on a stone pedestal, or of Sicilian stone. The cost, independent of the pedestal, will be £650; and the committee have now £700 in hand.

The Leigh Hunt Memorial, projected by Mr. S. C. Hall, about three years ago, to the *Art Journal*, is now in a fair road to completion. Mr. Joseph Durham, A.R.A., is the sculptor, and the memorial will be a bust and pedestal over Leigh Hunt's grave at Kensal-green Cemetery. The hon. secretaries are Messrs S. C. Hall and Edmund Oliver, and the hon. treasurer is Mr. R. Townshend Mayer, of 25 Norfork-street, Strand, W.C., by whom subscriptions will be thankfully received.

LEGAL INTELLIGENCE.

ON Friday last, at the Portsmouth Police Court, Mr. Thomas Backhurst, builder, Church-street, Landport, was summoned for having commenced building fifteen houses without complying with the byelaws of the Local Board. A fine of £5 and costs was inflicted. Mr Edward Farminer was summoned for a like offence, and the same fine was inflicted.

NUISANCE BY A BOARD OF HEALTH.—SCARISBRICK *v.* THE ORMSKIRK LOCAL BOARD OF HEALTH.—In this case, tried at the Nisi Prius Court, Liverpool, which was an action brought by Lady Ann Scarisbrick, the owner of extensive estates in the neighbourhood of Orm-kirk, to recover damages from the defendants for causing a nuisance by polluting a stream running through a portion of the plaintiff's property, and communicating with the lake in Scarisbrick Park, a verdict was taken by consent for the plaintiff, damages £1,000, to be reduced to 40s. on the abatement of the nuisance complained of. Mr. Manisty, Q.C., Mr. Holker, Q.C., and Mr. Charles Russell were counsel for the plaintiff, and Mr. Quain, Q.C., Mr Pope, and Mr. Wheeler had been instructed for the defence.

TRADE UNIONISM.—At the Salford sessions, Sylvester Greenhalgh, bricklayers' labourer, was indicted for stealing a spade, the property of Charles Lawrence. The prisoner had been employed upon a building at Oldham, and when he left he took with him a spade belonging to the prosecutor. It transpired that the prisoner was a non society man, and that he was driven from his work because he did not join the society. He sold the spade to a person named Partington, and when he was arrested said he should never deny having taken it, but that he would not have done so if the other men had not smashed his hod. One of the witnesses said it was true that the prisoner was compelled to leave the job because he would not join the society.—The Chairman: True liberty! I suppose if a man is not a member of your society, and comes to work with you, you don't treat him well? Witness: We give him every chance.—The Chairman: But you make it so hot for him if he does not join that he has to go and seek his living as he can? Witness: Of course.—The Chairman: And in addition to that, do you sometimes break his tools and injure him in that way? Witness: No; there were no tools broken in this case.—Mr. Watson in defending the prisoner, said the case seemed to have been pressed against him by the union men.—The jury acquitted the prisoner.

Our Office Table.

A prize of £25 is offered by Mr. W. R. Lloyd for a paper containing the best and most feasible plan for the temporary employment of operatives in casual distress. The paper is to be read at the forthcoming Social Science Congres at Birmingham. The prize will be adjudged by the council of the Social Science Association. Competitors must send in their papers to the secretary of the association, 1, Adam-street, Adelphi, on or before September 21.

M. Lameire's drawings, which formed a portion of the Architectural Exhibition this season, and which attracted so much attention, are now on view at the South Kensington Museum, in the Educational Department.

There are twenty-two alabaster quarries at and near Volterra, which yield annually about 500 tons of alabaster.

It has been decided that there shall be an exhibition next year of the industries peculiar to South Staffordshire and the East Worcestershire districts and of the works of art and *vertu* to be found therein. The exhibition is to be held at Wolverhampton, and is to be open from May to September.

On Saturday afternoon Mr. Clabrough, manager of the Bristol City Hotel Works, was presented by the men under him, as a mark of esteem, with a silver watch and gold chain, and a purse containing ten guineas. A dinner was held at the St. John's Porter-house, Stonebridge, at which a large number of the men attended. Mr. Ponsford, who presided, in proposing the health of Mr. Clabrough, expressed his pleasure that the feeling of antagonism which at one time existed between employers and employed was dying out, and that a new state of things was fast coming into existence.

A terrible fire has raged for some days in the forests near St. Aymer, Canada, and has finally reached the town, consuming the station and other buildings of the Northern Railway, and eleven dwelling-houses. The losses to the Dominion by fires in the woods this year have been enormous. All of the heavy timber lands have suffered in greater or less degree.

Shortly after seven o'clock on Tuesday morning the party walls of a house in Golden-square, London, fell with a heavy crash, leaving the interiors of the whole of the rooms and the inmates, some of whom were in bed, exposed. Fortunately the occupants of the different rooms sustained no bodily injury.

It is stated that the origin of Messrs. Sillar and Wagner's patent for purifying town sewage is very peculiar. One of the partners had been studying the Book of Leviticus, and came to the conclusion that "the ashes of an heifer"—that is animal charcoal—"and blood poured out upon the ground" (blood and clay mixed with other ingredients) would make a good purifier. This originated a series of experiments, which culminated in the late public trials at Tottenham and Leicester.

The Amsterdam exhibition of the works of art of all nations is announced to open on the 27th of September, and the works to be exhibited are to be sent in before the end of the present month. All communications to be made to the Commission of the Exhibition, at the Academy of the Beaux Arts, Amsterdam. There is one clause in the regulations which deserves notice; it is to the effect that no work can be received except from the producer, or accompanied by his consent in writing.

The British Association, which has met this year at Norwich, has chosen Exeter for its place of meeting for 1869.

Mr. Robert Platt, cotton spinner, Stalybridge, has undertaken to erect public baths for Stalybridge, at his own cost. They will involve a cost of several thousand pounds.

The Metropolitan Board of Works have offered to bear half the expense of widening King-court, Borough.

Specifications and drawings have been prepared for the erection of new fire engine stations in the following localities:—Peckham-road, Camberwell; South Parade, Chelsea; West India Dock road, Poplar; Essex-road, Islington; Adelaide-road, St. John's-wood; Bow-road; Charlotte-street, Marylebone; Evelyn-street, Deptford; Clapham Common; Driffield-street, Bow-road; Southwark-street; Bushey-green; Lewisham; St. Thomas-road, Old Kent-road; and Percy-cross, Fulham.

A contemporary states that for some reason best known to themselves the gas company have refused to light the lamps on the handsome new obelisk, erected on the site of Middle-row, Holborn, unless the gas be paid for by meter, and a special fee be paid for lighting and cleaning. The Holborn Board of Works had therefore to go to the expense of a meter, and to employ a man at 5s. a week or £13 per annum—no trifling item.

The "Musical Standard" comments severely on the rumoured removal of the organ of St. Stephen's Church, Walbrook, from its present position in the apsidal recess over the western entrance, downstairs. Our contemporary believes that, if this be effected, the beautiful case of the organ must be sacrificed, and the beautiful interior of St. Stephen's Church will materially suffer.

"All those valuable panoramas, pictures, works of art, and fittings" which once formed the stock-in-trade of the Colosseum, are for sale. "London by day," "Paris by night," "The real waterfall," "The Stalactite cave," and "The Earthquake of Lisbon" are all ticketed in lots, and will shortly pass away (if a purchaser be found) from the rather sensational exhibition which delighted the childhood of the present generation.

Considerable progress has recently been made (owing to renewed energy having been manifested in the prosecution of the works) in the construction of the Holborn Valley viaduct, and it is now thought that the whole will be completed and opened early in the spring. On Wednesday, several spacious houses, warehouses, and other premises, situated in Snow-hill and Farringdon-street, were disposed of by auction in order that the ground may be promptly cleared for the purposes of this great improvement.

The tension or strain of a fiddle string, or the proper tone of a piano, is ascertained with a piece of steel, called a tuning-fork. Mr. W. Airy, son of the well-known mathematician, has inversed this fact to the application of ascertaining the tension of a steel or iron rod by a musical note struck upon a string. In this way he has shown that he can define the strength or bearing power of rods used in the construction of bridges.

The Birmingham Architectural Society having determined upon an annual visit to some place of interest to the profession, made on Tuesday week its first excursion, the place chosen being Oxford. Several architects of the latter city made arrangements to receive their Birmingham brethren, and, accompanying the party, greatly assisted by able and interesting descriptions of the buildings visited.

Patents for Inventions

CONNECTED WITH THE BUILDING TRADE.

3430.—J. H. Wilson. Improvements applicable to water-closets and pumps connected therewith, which latter improvements are applicable to lift pumps generally. Dated December 3, 1867.

The patentee claims, first, constructing closet pans or basins of glass. Second, forming the same at the lower end with a shank or hollow faucet, having a lateral opening or aperture therein for discharging the contents thereof, substantially for the purpose and in the manner described and set forth. Third, turning the closet pan on its vertical axis for discharging its contents, substantially for the purpose and in the manner described and set forth. Fourth, constructing closet pans so that they may be removed or lifted from their seats, substantially for the purpose and in the manner described and set forth. Fifth, forming the rotating pan neck or seat of the rotating pan with recesses to receive tallow or other lubricating material. Lastly, the general arrangement and combination of the several parts described and set forth as applied to ships and other water closets.—Patent completed.

3457. W. A. Herring. Improvements in apparatus for warming buildings in which high pressure steam engines are employed. Dated December 4, 1867.

Here the patentee causes the exhaust steam from the engine to pass a coil of pipe of such diameter that the back pressure on the engine may be insignificant. This coil he encloses in a cistern or close tank with which pipes for warming the building are connected. The outlet pipe passes away from the top of the cistern or tank, then circulates through the rooms or buildings to be warmed, in the ordinary way of a hot water apparatus, and afterwards the pipe returns the same water in a comparatively cold state to the bottom of the cistern or tank. This water remains in the cistern or tank until it again becomes hot, and then it again circulates through the pipes of the hot water apparatus. In this way the rooms or buildings are warmed without other fuel than that necessary to keep the high pressure steam engine at work, and at the same time an economy of water is effected, which sometimes is of importance, the exhaust steam from the engine being condensed into a pure water which is returned into the boiler.—Patent completed

3487 J. Partington. Certain improvements in the method of heating buildings, and in the apparatus connected therewith. Dated December 7, 1867.

This invention consists in the use and application of an air chamber or vessel or vessels situated behind the fire, so as to form the back of the grate in cellars, kitchens, or other suitable positions. The chamber may be of any convenient form and made of metal, brick, fireclay, or combinations thereof, and from below it is supplied with cold air by means of a pipe and regulating valve, and on the air becoming heated by the action of the fire it ascends up a pipe applied to the upper part of the chamber, which extends up the chimney, and is carried into the various rooms at different heights by branch pipes, which may be opened to allow the hot air to escape into the room, or the heat may be obtained by radiation only.—Patent abandoned.

3486 W. H. Cooke. Certain improvements in springs to be applied to doors, and for similar purposes. Dated December 9, 1867.

This invention consists in applying to one end of the ordinary rod or wire a small wheel, the periphery being slotted, drilled, or ratchet toothed, into which slots, holes, or teeth, a sliding plate or bolt is introduced, to retain and prevent the wheel yielding to the torsion of the spring and turning, the fitting supporting the end of the wire and wheel being so arranged that the retaining plate or bolt enters into or passes through it, so as to form a strong support for the end of the plate or bolt. Thus, by forming the extremity of the wire square, and applying a key, having previously removed the plate or bolt, the wire may be twisted to an extra degree than when originally fitted, and by replacing the plate the extra torsion remains; or the direction of the torsion may be reversed; or by removing the plate or bolt the wheel wire turns in the fitting without any torsion.—Patent abandoned.

3500 W. R. Lake. Improvements in excavating machines, more especially designed for making ditches and drains. (A communication.) Dated December 9, 1867.

This invention consists, first, in so arranging the driver's seat that his weight shall counterbalance that of the plough whereby the earth is loosened. Second, in combining with a flanged wheel two revolving belts between which the earth is elevated when loosened by the plough. Third, in a mode of regulating the depth of the cut, and at the same time changing the seat of the plough point. Fourth, in the substitution of guides for the land sides in common use. Fifth, in a mode of regulating the delivery of the earth excavated. Sixth, in a device for raising the machinery in turning; and also in that for raising the entire machine except the wheels. Seventh, in the use of an adjustable shoe for finishing the ditch to receive drain tiles. Eighth, in so constructing the frame that, by folding the same, the distance between the wheels may be made wider or narrower. Ninth, in a mode of suspending the ploughs and frames so as to permit the said ploughs to work at a constantly increasing depth below the surface of the earth. Tenth, in the attachment of the draught at whatever depth the plough may be working. Eleventh, in arranging the plough and the parts connected therewith, so as to loosen the earth and throw it between the elevating belts. The machine is more expressly designed for making ditches and drains. Reference to the drawings is essential to a full description of the invention.—Patent completed.

Trade News.

TENDERS.

Blackheath.—For erecting a new lodge to Congregational church. Mr. J. E. Saunders, architect:—

Little	£578
Larke	576
Colls and Sons	575
Jerrard	564
Staines and Son	548
Perry	488

Croydon.—For completing a pair of villas at Croydon for Miss Banks. Mr. Edgar Aldous, architect. Quantities by the architect:—

Dennis, Coleman-street, Camberwell (accepted) ..£480

Dulwich.—For completing four houses in Northfield-road, Dulwich, for Mr. Manning. Mr. Edgar Aldous, architect. Quantities not supplied:—

King (accepted)	£375

Greenwich.—For pulling down Upper Circus Lodge, Royal Hill, and building a new house and shop, for Edwin Shalless, Esq. Henry Roberts, architect and surveyor. Quantities not supplied:—

	Including old materials
Messrs. Hoare and Postlethwaite	£950
Ware	865
Fenn (accepted)	650

New Cross.—For building cowshed, for Mr. Josiah Crutcher, Pomeroy street, New Cross. Mr. Edgar Aldous, architect. Quantities by the architect:—

Vaughan	£308	0	0
Dennis	242	0	0
Snelling and Derby (accepted)	208	12	3

Kingston-on-Thames.—For enlargement of workhouse. Messrs. F. H. Rushforth and C. L. Luck, architects. Quantities by Mr. H. T. Northcroft:—

Simpson	£6744
Mann	6621
Thomas	6523
Nightingale	6372
Higgs	6325
Collings	6312
Gammon	6182
Manley and Rogers	5941

Leytonstone.—For lodge and receiving wards for the Guardians of Bethnal-green. Mr. William Mundy, architect. Quantities supplied:—

Read	2397
Cook	2313
Read and Son	2267
Forest	2215
Dyer	2169
F. and F. J. Wood	2155
Arber	2142
Hill and Co.	2105
Emor	2075
Mundy and Hutchinson	2050
Perry and Co.	2000
Rivett	1990
Hodson	1963
King and Sons (accepted)	1960

London.—For building two shops and three houses in Queen's-road, Montpelier-road, Peckham. Mr. Edgar Aldous, architect. Quantities by the architect:—

Messrs. Snelling and Derby (accepted)...£2100

Potter's Bar.—For erecting a new Baptist chapel at Potter's Bar. W. Allen Dixon, architect:—

J. Garrud (accepted)	£717

Stow Maries (Essex).—For additions and repairs to rectory-house, buildings, and chancel of parish church. Mr. Frederick P. Walters, architect:—

Killby	£1170
Saunders	1100

Totnes.—For restoring the church at Totnes:—

Samual Reeve (accepted)	£1095

Tottenham.—For two villa residences, Green-lanes, for Mr. Jenkins. Mr. C. H. Sharp, architect:—

Casey	£1428
Carter	1250
Wright	1230
Henshaw	1195
Fowler	925

Twyford.—For erecting a house and conservatory for W. H. Toomer, Esq., Twyford. W. Allen Dixon, architect. Quantities supplied:—

Staines	£3380
Laurance	3174
Manley and Rogers	3157
Mann	3145
Eaton and Chapman (accepted)	3050

Wandsworth Common.—For house and offices for Mr. Robert Neal, Mr. Neal furnishing bricks, sand, and gravel. Mr. Charles Bowes, architect:—

Atkinson	£714
Lathey Brothers	640
Thornton	630
Easton Brothers	607
Gates	593
Strong	543
Wheeler	537

COMPETITIONS.

India.—Public Works' Department.—Competitive examinations for forty appointments in the Engineer Establishment in the month of December next. W. T. Thornton, India Office.

CONTRACTS OPEN FOR BUILDING ESTIMATES.

Halifax.—Extension of time.—For proposed new infirmaries, fever hospital, &c., at the Halifax Workhouse. C. Barstow, Clerk to the Guardians.

Herefordshire County and City Asylum.—September 14.—For the erection of the above named building R. Griffiths, architect, 3, Martin-street, Stafford.

Aldershot.—September 15.—For the erection of a billiard room at the Royal Artillery barracks. Royal Engineer office, Aldershot.

Metropolitan Board of Works.—September 24.—For constructing and maintaining in repair certain intended brick sewers. J. Pollard, clerk, Spring gardens.

Chesham, Bucks.—September 2.—For the restoration of the parish church. Rev. A. F. Aylward, Chesham, Bucks.

Oxford-road, Manchester.—For the erection of a new catholic church. J. A. Hansom, architect.

Burton-on-Tre t.—September 12.—For alterations and additions to police station. R. Griffiths, architect, 3, Martin street, Stafford.

Highgate.—September 30.—For the erection of an infirmary at Highgate. J. Moore, clerk, vestryhall, St. Pancras.

Leavesden Woodside (near Watford).—September 30.—For the erection of schools. J. Moore, clerk, vestry hall, St. Pancras.

St. Pancras.—September 3.—For the erection of a mortuary house and other works on the burial ground adjoining the workhouse. J. Moore, clerk, vestry hall, St. Pancras.

Teignmouth, Devon.—For the erection of a coast guard station. Drawings, &c., at coast guard watch room. Tenders to the Admiralty coast guard office.

Board of Works, Limehouse District.—September 14.—For watering, scavenging, and removal of dust. T. W. Ratcliffe, clerk to the board.

Islington.—September 8.—For the erection of six houses near the Barnsbury road. Mr. J. T. Barlow, 7, Belle Vue villas, Seven Sisters'-road, N.

West Ham Union.—September 23.—For the erection of an apparatus capable of cooking for 800 inmates. F. E. Hilliary, clerk to the guardians, Leytonstone.

CHERTSEY (Surrey).—September 7.—For the erection of a villa residence. T. Wormiacott, architect, Faroham.

LUTON, NEAR CHATHAM.—September 12.—For sinking wells or shafts, and for excavating galleries or headings, in the chalk. S. M. Heckford, secretary, Brompton Water works Company, 3, Military road, Chatham

METROPOLITAN BOARD OF WORKS.—September 29.—For the erection of fire brigade stations at Amhurst road Hackney, and Upper Tooting. J. Pollard, clerk to the board, Spring Gardens.

COLOGNE WATER WORKS.—September 18.—For the supply and erection of high service reservoir, two Cornish steam engines, steam boilers, likewise for cast-iron pipe, cocks, &c. At the office of the Chief Burgomaster.

MANCHESTER.—For erecting a new Catholic church, Oxford-road. T. A. Hansom, 25, Alfred place, Thurloe square, London, S.W.

HANLEY.—September 7.—for the erection of coach houses to Hanley Hotel. Messrs. Scrivener and Son, architects, Hanley.

HULL.—September 5.—For the whole or any portion of the works required in the erection of St. Matthew's Church, Anlaby-road. Adams and Kelley, architects, 18, Park-row, Leeds.

PROPERTY SALES.

AUGUST 19.

AT THE MART.—By Messrs. Fuller and Marr.—Leasehold house and shop, No. 3, Langton terrace, Shooter's hill road, Blackheath, let at £60 per annum, term 85 years unexpired, at £4 per annum sold for £700.

Leasehold house and shop, No. 4, Langton terrace, let at £65 per annum, term and ground rent similar to above—£760.

Freehold villa, No. 1, Richmond villas, Norbiton—£240.

Freehold villa, No. 2, Richmond villas, Norbiton—£240.

Freehold three houses, Nos. 1 to 3, St. George's place, Norbiton—£400.

Leasehold house, situate in Providence road, Malden, let at £16 per annum, term 99 years from 1861, at £4 10s. per annum—£100.

Leasehold three houses, situate in Providence road, Malden, producing £35 2s. per annum, term 98 years from 1858, at £3 15s. per annum—£190.

AUGUST 20.

At the Mart.—By Messrs. Beadel.—Freehold and copyhold farm, known as Clarke and Beadle's, situate in the parishes of Tollesbury and Tolleshunt D'Arcy, Essex, comprising a farmhouse, homestead, buddings, and 104a. 0r. 30p. of land—£2,520.

Freehold two residences, with stables, cottage, farm buildings, and 40a. 1r. 19p. of arable and meadow land, in the parish of Frostenden, Suffolk—£2,565

Freehold property, known as Fidler's Hall, Romford, Essex, comprising two cottages, homestead, and 1sa. 1r. 9p. of arable land—£1,710

By Mr. Newbon.—Leasehold four houses, Nos. 5, 6, 7, and 8, Walbrook street, New North road, Hoxton, let at £25 and £26 each per annum, term 61 years from 1813, at £3 each per annum—£220 and £225 each.

Leasehold two houses, Nos. 54 and 55, Bemerton street, Copenhagen street, Islington, let at £28 each per annum, term 96 years from 1844, at £12 per annum—£470.

Leasehold two houses, Nos. 15 and 16, Charles place, Hertford place, Kingsland, producing, £60 per annum, term 34½ years unexpired, at £8 per annum—£305.

Leasehold house and shop, No. 62, Prebend street, New North road, Islington, let at £30 per annum, term 75¼ years from 1851, at £6 6s. per annum—£290.

No. 63, Prebend street, let at £30 per annum, term and ground rent same as above—£275.

No. 64, Prebend street, let at £32 per annum, term and ground rent same as above—£285.

No. 65, Prebend street, let at £26 per annum, term and ground rent same as above—£280.

No. 66, Prebend street, let at £26 per annum, term and ground rent same as above—£270.

No. 67, Prebend street, let at £30 per annum, term and ground rent same as above—£275.

No. 68, Prebend street, let at £28 per annum, term and ground rent same as above—£265.

No. 69, Prebend street, let at £30 per annum, term and ground rent same as above—£265.

No. 70, Prebend street, let at £32 per annum, term and ground rent same as above—£265.

No. 71, Prebend street, let at £32 per annum, term and ground rent same as above—£265.

Nos. 1 and 2, South street, New North road, producing £40 10s. per annum, term 75¼ years from 1851, at £12 12s. per annum—£320.

Leasehold house, No. 14, South street, let at £27 10s. per annum, term and ground rent similar to above—£290.

Leasehold house, No. 12, Modbury terrace, Queen's crescent, Haverstock hill, let at £28 per annum, term 99 years from 1850, at £6 per annum—£230.

At Garraway's.—By Messrs. Stuckey and Winstanley.—Freehold, 7a. 2r. 2p. of arable land, called Bathfield, Sussex—£375.

Freehold, 1a. 3r. 2p. of meadow land, called Brook Meadow, Sussex—£100.

Gregory's and Button's Farm, Sussex, comprising farmhouse, buddings, and 56a. 2r. 34p. of land—£4,500.

AUGUST 21.

At the Mart.—By Messrs. Gadsden, Ellis, and Scorer.—Freehold residence, known as Park House, Walton on-Thames, let at £50 per annum—£850.

AUGUST 24.

At the Mart.—By Mr. Whittingham.—Freehold building land situate at Acton, in 41 lots—lot 261, £50; 262, £99 18s.

Freehold building land, situate at Norwood, in 41 lots—lot 258, £135; lot 259, £60; lot 260, £60; lot 285, £80; lot 286, £36; lot 287, £40; lot 289, £35; lot 290, £38 6s. 8d.; lot 296, £35; lot 297, £38 18s. 9d.

BANKRUPTS.

TO SURRENDER IN BASINGHALL-STREET.

George Day, Kingsland road, builder, September 3, at 12.—John Hoar, Smith street, King's road, Chelsea, carpenter, September 4, at 1.—John Howell, Portobello road, Notting hill, carpenter, September 3, at 12.—Levi Lee, Kentish town road, stonemason, September 2, at 12.—William Sexton, sen., York-place, Barnsbury, joiner, September 3, at 11.—William John Baker Jubilee street, painter September 10, at 12.—Robert Henry Clement, Sussex street, Brixton, carpenter, September 10, at 12.—Reuben Watkins, New Kent road, plumber, September 4, at 12.

TO SURRENDER IN THE COUNTRY.

Thomas Ducross, Bellbroughton, Worcestershire, painter, September 5, at 10.—Henry Edwards, Cardiff, builder, September 2, at 11.—Henry Millward, Delph, builder, September 4, at 10.—Thomas Patton, Middlesborough, stone mason, September 7, at 11.—John Rosesby, Appleby, Lincolnshire, mining engineer, September 9, at 12.

NOTICES OF SITTINGS FOR LAST EXAMINATION

October 3, T. Collins, Grove road, Fulham, builder.—November 20, E. Taylor, East Dulwich, builder. October 2, J. W. and W. A. Sanders, Guildford street, Gray's Inn road, builders.—October 5, H. Green, Cardiff, builder.—September 29, J. Amess, Bristol, timber merchant.

BANKRUPTCY ANNULLED.

William Henry Baker, Cottesmore, Rutland, Ilmeburner, August 19.

DECLARATION OF DIVIDEND.

C Fisher, Henley on-Thames, builder, div. 3s. 5½d.—J. Cotes, Marlock Bath, painter, div 4d.—G. Gale, Sherborne, builder, div. 1s. 2½d.—F. W. Vigus, Exeter, timber dealer, div. 2s. 6d.

PARTNERSHIPS DISSOLVED.

Newsome and Rhodes, Shipley, masons.—Laver and Hewson, Maude road, Camberwell, builders.—Johnson and Bromley, Liverpool, plumbers.

THE BUILDING NEWS.

LONDON, FRIDAY, SEPTEMBER 4, 1868.

ORNAMENTAL CONSTRUCTION.

IT is indisputable that nothing presents a more unsatisfactory and incongruous appearance than a building in which the ornament is too palpable, and in which the decorations resemble a series of patchwork. The highest æsthetical effect and the general beauty of the *coup d'œil* depend, in great measure, upon the ornamental portions of the building forming an integral part of those upon which its strength and stability are founded. This remark, of course, does not allude to statues placed either upon pedestals or in niches, and which are removable at pleasure. They may, it is true, greatly enhance the general appearance of a structure, but their absence, at the same time, ought not seriously to mar its beauty. An edifice that is dependent for its architectural merit solely upon the statues surrounding it is but a very poor specimen of art. Manifestly, to obtain the maximum degree of æsthetical excellence the principle to be adopted would be to build altogether the whole structure with the same material that was employed for the ornamental purposes. This is what has been carried out in continental cities, where cathedrals and churches have been erected entirely of marble ; but the only example we have to show is that miserable flat-topped abortion called the "Marble Arch." As a constructive and not merely ornamental material the marble tribe is far superior in strength and durability to many of the granites and limestones used, and it may ultimately prove that it would have been wiser, in an economical point of view, to have employed that material in the erection of the Palace of St. Stephen's.

From the limited use made of ornamental marbles among ourselves there are not many experimental results extant respecting their absolute powers of resistance to a crushing or a transverse strain, and we are, therefore, not so well acquainted with their constructive merits as we should be had they been tested to the same extent as their companions—timber, iron, and stone. Captain Fowke was apparently not satisfied with what had been done previously to his time in the way of experimenting upon timber, for he tested upwards of 2,500 various specimens of different woods. Some of these came from the forests of Hungary, Austria, and Russia, others from the English colonies of India, Guinea, Tasmania, and Australia, and others from the West Indian islands of Trinidad and Jamaica. He deduced from the results of his experiments the specific gravity, the breaking weight, and the amount of deflection due to a transverse strain of all the woods, together with their resistance to a crushing force, both in the direction of and across the grain, and, finally, their relative degrees of elasticity. It would appear that the erection of any large structure is necessarily attended with a certain number of experiments upon the materials selected for its construction, for we find that upon the occasion of the building of the new Opera House, at Paris, some very valuable results were obtained by M. Michelot, chief engineer of "les ponts et chaussées." He directed his inquiries principally towards ascertaining the crushing strength of the various stones and marbles used in that splendid edifice. Most of the columns are of jaspar, from St. Gervais, and, together with the porphyrites, evinced a strength superior to that of granites and syenites. This last is a peculiar description of the granite tribe, and named after the granite found at Syene, in Egypt, which has hornblende in the place of mica, one of the constituents of common granite. The porphyritic rocks, as the Greek name implies, are the results of either volcanic or subterranean igneous origin, and it is not surprising that they should be endowed with superior powers of resistance, owing to the double action of heat and pressure they are subjected to in their formation. It is a significant fact, of which our London architects may take cognisance, that their Parisian brethren are gradually abandoning the use of the coarser descriptions of building stones, which are of only an inferior quality, and which resist very inefficiently the action of the weather, and, availing themselves of the resources of the new suburban lines, are introducing a superior and handsomer kind of stone in their works. The principal stones used in Paris for architectural purposes are the syenites, granites, and porphyries of the Vosges, the green melaphyre of Ternuany, and the granites of Mont Blanc. All these are classed by Humboldt, in his "Cosmos," as indigenous rocks, by the early geologists as plutonic, and by Sir Charles Lyell as hypogene. The protogenes of Mont Blanc are geologically so termed to distinguish them from ordinary granites ; they have, instead of mica, in their composition, talc or steatite.

Polished granites from Peterhead and the Duchy of Cornwall are familiar to all of us, and we shall soon witness some magnificent examples in the massive columns intended to grace the piers of the new Blackfriars Bridge. A very beautitul marble is used in Bavaria, belonging to the Dioritic porphyries, having a deep sea-green tint, and approaching in some instances to the well-known serpentine. Russia, usually supposed to be very much in the background so far as the liberal arts and sciences are concerned, can produce from her imperial marble works specimens which, for beauty of design and fidelity of execution, can compare with those of any other nation. Her artisans work to great perfection in all the varieties of porphyritic rocks, including the unrivalled jaspars of the Ural mountains, and the rhodonite, a peculiar and rare stone constituting a silicate of manganese. Let us now inquire a little into the advantages that these materials offer for ornamental and constructive purposes, and we will begin with the jaspar. It will be at once understood that there is a great difference between the large rough-quarried jaspar and that forming the variety which is recognised as an inferior description of precious stone. They may have the same chemical composition, but, nevertheless, that does not establish an identity. Charcoal has precisely the same chemical composition as the diamond, and so has plumbago, but notwithstanding, a lump of charcoal or plumbago is not a diamond. The appearance of a quarry of jaspar is very remarkable ; the colours appear to be continually changing, like the fabled tints of the chameleon, among which predominate a blood red, a pink, and a green, mingled at intervals with the peculiar opaque whitish grey of pure quartz. The red variety is exceedingly hard and takes a splendid polish, although these advantages are not by any means common to all the specimens. As a rule, the presence of carbonate and sulphate of baryta interferes with the working and polishing of the stones, and moreover renders them susceptible to the influences of the weather. Upon the whole, it is advisable not to employ them for external work, but to confine their services, like the celebrated Caen stone, to the purposes of internal ornament and decoration. Practical experience has shown the folly of employing jaspars in external work. Monuments have been built of them which have disintegrated with great rapidity.

It is certainly true that a marble is a limestone, but every limestone is not a marble, but only becomes so when it is possessed of certain properties. A marble may be defined as a limestone which is, in the first place, capable of receiving a certain amount of polish; in the second, endowed with a distinct tint and uniformity of colour; and, in the third, able to be quarried in masses which are free from cracks and shakes. As may be expected, marbles varying in purity, and in the degree in which they possess these qualifications, are to be found in nearly every country, particularly in those exhibiting a hilly contour, and where the geological nature of the ground is of a metamorphic character. Undoubtedly, the difficulty of procuring in sufficient abundance marbles suitable for construction has delayed the more general introduction of that beautiful and durable material as a building agent, but now that increased facilities are afforded, it ought to take that prominent position to which its antecedents most unquestionably entitle it. Another reason, increasing the difficulty of procuring it, is that the quarries are rarely situated in accessible localities, and seldom or never near the sea coast, or where a main route of intercommunication would be likely to run. As an example, although there is abundance of white limestones, yet the quarries of Carrara are the only source of white statuary marble, and ever since the time of the Romans have supplied the whole world with that particularly esteemed artistic material. It is probably this circumstance that rendered the Italian sculptors so famous in the art, although it must be confessed that the same material is still available for similar purposes. Greece is rich in marbles, and ever was, as the ruins of her temples abundantly testify. In Laconia the celebrated red marble of antiquity has been rediscovered, but the discoverers have rested content with recording the fact, and the quarries remain unopened and unworked. In Portugal, Prussia, and Belgium, marble is employed as a constructive material upon a much more extensive scale than in our own country. The French, not content with their own supplies, import largely from the last-named country. Austria possesses a peculiar marble of a bright chestnut red, not met with anywhere else, and, moreover, endowed with the advantage of being quarried of very large size. The New World has not been forgotten by nature in the distribution of this particular gift. New York can show numerous examples of marble ornamental construction, all of American or Canadian production. Although we are still far from approaching to anything like real architectural merit in our public buildings and erections, yet no one will deny that the taste of the age is improving. There is a general tendency to adopt tasteful, elegant, and ornamental designs for great works, which only needs encouragement to develope more fully. We trust that the time will come when we shall build not in stone but in marble.

HIGH AND LOW ART ACTION.

IN these hasty and imperfect notices of great subjects, I should wish it to be understood that I do not dwell on them for the mere sake of talking about art details and differences of opinion and taste existing among modern artists, but I wish, if possible, to develope a new plan and system of art action and practice, more just to the great body of working artists and workmen than that now in vogue and so universal. These slight papers, therefore, have a connection with each other, and all aim at a definite and well defined end—a new system of art education, and consequent art *practice*, and a more universal and fairer system of exhibiting those artistic and individual results to the public. I hope, in a futnre paper, to be able to give a general and intelligible synopsis of this. Meanwhile, I go on with the well-nigh forgotten art of Phidias, for which it is to be feared there is but small interest, so that extreme brevity is necessary, and, for more than one reason, politic.

Poor Phidias ! one wonders whether he ever dreamed, like Leonardo, of *railways* or art manufacture, or what he would have done

had he had any idea of the ultimate fall of his magnificent work, put away in a big, awkward room, after well-nigh total destruction, and transportation to a place he never heard of, and fated to be looked at by here and there one about once in a month, and even that falsely! Fortunate is it for us that he knew nothing of high art or the "ideal spiritual;" fortunate, indeed, is it that his mind was of a more commonplace and practical turn, and that he was, consequent on it, modest enough and satisfied to do common work and a little mere natural copying; and this thought it is that brings us to another nameless workman of great capacity, and whose work will, if carefully thought over, help to show how false that idea is which divides art into high and low, and accepts the one order of workmen while it rejects the other.

Most people have heard of Dr. Barth, but few, probably, know much of where he went and what he did. His African travels took him into regions altogether out of the ordinary course of the traveller and tourist, and so brought him into contact with objects not seen by any but himself. There would seem to be scattered over considerable tracts of North Africa remains of buildings and rock sculptures by a people before the Roman occupation, or, at least, beyond its influence, and the particular sculpture to which reference is now made is one of these rock carvings. It is on a large block, about 12ft. long and 5ft. high. "The surface is quite smooth, and bears testimony to a state of life very different from that which we are accustomed," says Dr. Barth, "to see now in these regions, and illustrates and confirms St. Augustine's statement that the ancient inhabitants of this country used cattle for their conveyance and not camels, as at present time." The sculpture represents (there is in his book a small, badly executed woodcut to show what it is like) a dense group of oxen in a great variety of positions, all moving in one direction; on the end of the stone, which is now broken off, the pond or well was represented from which the cattle were to be watered. "Some of these bulls are most admirably executed, and with a fidelity which can scarcely be accounted for, unless we suppose that the artist had before his eyes the animals he chiselled." Dr. Barth's sketch is very slight, and, of course, nearly everything has been lost in the wood-cutting, but still there is quite enough to show how finely and admirably these animals have been sculptured and drawn by the nameless workman who executed them. My special object in calling attention to them and to work of this kind is to show how we may travel in a moment from low art to high art, from these rude though so living sculptures on mere and bare rock surfaces to the perfect and finished work of the Athenian temple. Let this be considered, if it please anyone to do so, the rudest of low art (for the Academy certainly would not so much as look at it), and the "cattle" panels of the Parthenon the highest art by the very greatest of sculptors; then I can only say that this rough workman had that within him enabling him to do such work as the representing living and moving animals, which Phidias himself might well have envied. There is no more instructive lesson to be learnt in these days, if we were prepared for it, than this of the possibility of finding in rude work and in rude uncultured men the elements of that art, and art capacity, which is now supposed to be the exclusive prerogative of the highest art and the highest refinement of artistic power. We are *not* fit for it, because all the lower men, as they are called, are working as manufacturers, and not as individual artists or art-workmen.
